If one were prepared to grant the lecturer's axiom which, although possibly not baldly stated in so many words, practically settled as a non-combatable fact, that open spaces in large cities were synonymous with loveliness, provided that they were well-planned, carefully laid out, and so forth, one might be more ready to accept his comparisons between London and Paris as being helpful towards remedying the unloveliness of our own capital. Unfortunately, however, there are people who consider the narrow streets with their vistas, their mystery, their colour, and the hundred little "surprises" which the wayfarer happens upon as he treads their cobble-stones, have a beauty and an atmosphere which he would not exchange for all the County Council "improvement" schemes which could be given him. A writer in the "Pall Mall Gazette" in a carefully written article on the subject, admirably sums up this phase of the question when he says:—"Nobody who sees London would wish to have her delivered over to the tender mercies of a Baron Haussmann, and 'improved' as Paris was improved out of all semblance of a picturesque past into a present of dull, spacious, rectangular monotony." It is obvious, therefore, that on a question of aesthetics there must always exist divergencies of opinion; it is as well to recognise this before promulgating any particular scheme based upon one set of ideas. Whilst, however, there are many people opposed to transfiguring London in any attempt to imitate a city like Paris, all lovers of the beautiful are unanimous in their anxiety concerning every new erection which, nolens-volens, is thrust upon the acceptance of the Londoner. Most particularly does this apply to important changes in our thoroughfares, such as are contemplated between Holborn and the Strand. The question is not whether such a change is beneficial—which few can doubt—but whether, now that the matter is actually in progress, the frontage of the new street will be the very best which English architects can design. Once again one is met with the extraordinary difficulty of obtaining a unanimity of opinion as to the qualification of the "eminent" architects who have been invited to submit designs for the County Council. One is considerably surprised sometimes with the list of names in a selection such as has been made in the present instance, and one can only hope that the case in point may not prove as unsatisfactory as its predecessors, founded on similar lines.

Who, for example, can conscientiously maintain that some great names in the Profession were not omitted in the recent selection of architects for the new Government Offices in Whitehall? One has to go to the first cause in matters of this kind, to enquire into the qualifications of the selection committee, not to cavil at the works of the architects selected, who are presumably doing the very best work they can. There are a great many circles bound together by much red-tape, but it does seem an important and urgent necessity to arrive at the inner circle, which, as a rule, is some governing body wholly incompetent and indifferent as to matters architectural. If Mr. Whiteing's lecture has stirred up any real interest in the mind of the average Londoner concerning the streets he lives in, it will have done much—very much—in the right direction; but until the average Londoner insists on delving deep into the heart of these new schemes to "improve" London, until he acquaints himself with every detail of the preliminary organization, no radical improvement can be expected in the architecture of our great metropolis, which had better be left alone until those who would disturb it can prove their entire competency for their responsible undertaking.

H. S. M.

On Reflection.

The Furniture Exhibition.

ARCHITECTURE and furnishing are, or should be, so closely allied that an exhibition of furniture should interest architects and designers as well as members of the furnishing trades. It is worth while, then, to consider whether any useful suggestions may be derived from the Furnishing Trades' Exhibition which has been held during the past ten days at the Agricultural Hall, Islington. Let it be said at once that neither the artist nor the craftsman will find here much that is worthy of admiration or imitation. If of a philosophic spirit, he might, it is true, derive some benefit on the *lucus a non lucendo* principle. It is useful sometimes to have before one an example of how not to do it, and the Furniture Trades' Exhibition might prove really valuable to art workers as a museum of things the designer should avoid—a kind of artistic chamber of horrors. Besides, it is surely some gain if the contemplation of the meretricious and vulgar productions of Curtain Road inspire us with greater respect for the art craftsmen of the past, and if the sight of the "art pottery" of Stoke-on-Trent fill us with a new thankfulness for the ceramic treasures of South Kensington Museum. For these reasons it is somewhat to be regretted that the Exhibition at the Agricultural Hall is not open to the public, but is confined to members of the furnishing trades. The fact that admission is thus restricted suggests one or two considerations which must not be overlooked lest we should do injustice to the furnishing trades. It would be wrong to suppose that the furniture to be seen at the Agricultural Hall represents the highest standard to which British manufacturers have attained. Many of the best wholesale firms in London and the provinces are not represented at all, while those who do exhibit send not their best and most artistic but their most saleable goods to what is in reality rather a market than an exhibition; and of course those manufacturers who appeal, not to the retailer, but direct to the public (and these include such firms as Heal's, Waring's and other makers of genuinely artistic furniture), are entirely unrepresented at an exhibition of this sort.

Modern Taste in Furnishing.

PERHAPS the chief interest of the show to those who are neither buyers nor sellers lies in the index it affords of the trend and development of taste in furnishing. The things one sees at the Agricultural Hall are the things that are being manufactured by the hundred for the adornment of the homes of the enlightened British Public. It is not a cheering thought, for though here and there one comes upon an oasis in the desert of mediocrity—as in the case of the well-designed mantelpieces that are being shown by the Bath Cabinet Makers Company—yet the majority of the exhibits are either indifferent or positively bad. It is true, of course, that the manufacturer no longer asks us to recline on a horsehair sofa or decorate our drawing rooms with wax fruit and flowers. These horrors, indeed, are gone, but in their place are settees covered with cheap and showy saddlebags or velvets finished off with incongruous trimmings, and "art pots" that repel by their aggressive vulgarity. In the matter of bedsteads there seems to be a slight tendency towards a better style than we have been accustomed to since the reign of the metal bedstead began; the familiar brass bedstead with its elaborate and meaningless decoration is still in evidence, but side by side with it are others designed on simpler and more tasteful lines. The "Sheraton" bedstead, as it is called, is formed

of plain square pillars without any useless excrescences, the design being suggested, perhaps, by some of Sheraton's cabinet work. If not thoroughly satisfactory, it is a great improvement on the vulgar rococo stuff that is still sold in great quantities. Wooden bedsteads seem to be gaining ground in popularity; and this is well, for while they are unexceptionable on sanitary grounds, being made with iron base and laths, they offer considerable possibilities to the designer, and can be made to harmonise with the other furniture in the room. Unfortunately the examples at the Exhibition do not show much appreciation of these possibilities. In regard to settees and easy chairs makers seem to be very successful in producing furniture that is luxuriously comfortable, but much of it is sadly lacking in elegance and grace. One sees little besides individual pieces of furniture at the Agricultural Hall; there are very few interior fittings, and the fitted room is conspicuous by its absence.

Public Baths: Some Suggestions.

MR. SAXON SNELL asks in his paper on public baths and wash-houses, which we published last week, why the Roman ideals should not be copied, and he suggests "an establishment where, for the sum of sixpence, you might enjoy at will a modified form of Turkish bath, a swim, and a few gymnastic exercises, with the opportunity of an adjournment afterwards to the lounge for a cup of coffee, the daily papers, and the latest war telegrams." This suggestion is worthy of the consideration of our authorities. It is not proposed to introduce baths like those of Titus, Diocletian or Caracalla, which were of immense size (the Caracalla baths had, it is said, 1,600 seats for the use of bathers and the Diocletian 3,200), but to adopt a modification of them. It might be noted that the largest of these Roman baths had a stadium for the games of the young men, with raised seats for spectators, and places from which philosophers and literary men could discourse or read aloud their latest compositions. Everything was done on a magnificent scale, so much so in fact that Seneca says: "To such a pitch of luxury have we reached that we are dissatisfied if we do not tread on gems in the baths." Probably few British bathers are likely to tread on gems in their baths; certainly not in those of the London vestries. A feature, however, of these Roman baths that might easily be adopted in those of the present day was the planting of trees in the interior open space near the porticoes. The relation between trees and water is eminently suited to the former being used in the manner described, and the appearance of a public baths with a row of columns against a background of green would surely be excellent. In their baths, as in everything else, the Romans exhibited technical skill of the highest order, and the way in which they rendered their walls impervious to moisture, carried and heated their water, and constructed flues for the conveyance of hot air through the walls was remarkable. We may therefore well take a lesson from this great people in the matter of baths, though, perhaps, we shall never be able to make such low charges to the users as they did, for their charge was only a quadrans, or about half a farthing. A suggestion which we might make as a modification of Mr. Snell's is that at the end of a public swimming bath there should be a row of columns dividing off a large hall lighted from the top, having a glazed tile or mosaic floor, and fitted with gymnastic apparatus of all kinds. Bathers could thus exercise themselves in two ways, and when they became tired of the bath could go to the hall, and *vice versa*. An addition like this would not entail a very large extra expenditure, and would certainly add much to the popularity of the baths. We should like to see it carried out somewhere.

Men Who Build.

No. 59.

WILLIAM EMERSON, F.R.I.B.A.

THE very widespread interest which has been shown in connection with the recent presidential address delivered by Mr. Emerson before the members of the Royal Institute of British Architects will give a special interest to the following notes upon his work and career. It is usual in the case of any man famous for high excellence in his profession to examine the records of his ancestors in order to trace the rise of the particular talents for which one's subject is noted. Such a course, however, in the present case affords us no light. The architect who now honourably occupies the presidential chair of the Royal Institute does not appear to have had any forefathers immediate or remote who were specially interested in architecture. It can only be said that William Emerson was born in the year 1855 of parents not in the least connected with architecture or the pictorial arts, and that at an early age he began to show a great liking for drawing all sorts of buildings. His unguided talent selected intuitively its own material, and the early predilection for sketching architectural subjects showed unmistakably that the boy was meant to become a designer of what he so industriously copied. This fact was so impressed upon an architectural friend of the family that he urged the parents of William Emerson to place their son with an architect. This wise step was accordingly taken, Mr. Emerson being a pupil first of Messrs. Hatherston and Pite, and then entering the office of William Burges, one of the most original exponents of pure Gothic at the time of the mediæval revival. Mr. Emerson's early training therefore was all in favour of Gothic, and it may be mentioned here that if one cannot trace the origin of Mr. Emerson's talents to his ancestors, one is able to see that some of his best attributes were strengthened by his excellent training with Burges. Some of Mr. Emerson's earliest architectural work was in connection with Cork Cathedral, in which Burges showed a wealth of invention in mediæval detail, which few architects of this age have approached. Burges's work evidently impressed his pupil, for Mr. Emerson in his address bore eloquent testimony to his former chieftain's genius.

It was not Gothic alone, however, which came before him during his period with Burges. The designing of the Bombay School of Art fell to Burges, and when the drawings were completed William Emerson was fortunate enough to have the task given to him of conveying the designs to Sir Bartle Frere, the then Governor of Bombay. Burges, of course, had produced a fine design, but owing to a lack of knowledge of the peculiar requirements of Indian architecture it was thought desirable not to carry out the building on his lines. Mr. Emerson's task was therefore completed, but seeing great opportunities for a resident architect in India, he decided not to return to England. The choice was evidently a wise one, for his hands were soon full of important commissions. Mr. Emerson was lucky in commencing work in Bombay at a time when a considerable amount of money was being spent on public works and in beautifying the city in many ways. The margin of expenditure to which the architect might go was never fixed with any mean hand. It would make many an English architect's mouth water to hear the freedom which was allowed in the matter of cost. One of his most interesting works at Bombay was the markets, which are still considered to be a show sight in one of the most beautiful cities in the world. In the centre of the market buildings Mr. Emerson placed a fountain, which was decorated by a series of sculptured panels by none other than Mr. Rudyard Kipling's father, who was at that time instructor to the Sculpture Department of the Bombay School of Art, which had been erected on plans more in accordance with Indian hygiene than those of Mr. Burges to which reference has already been made. In

most of his Indian works Mr. Emerson followed the indigenous styles on broad lines. Naturally he found that any slavish following of Indian architecture was incompatible with modern requirements, the number of rooms required alone necessitating a semi-European treatment. In many cases, the special needs of the building dictated to a large extent the treatment which should be adopted. The Allahabad University, for instance, was a Mohammedan institution, whereas the Bhaunagar Hospital was for Hindoos. Both buildings required radically different arrangements, materially affecting the architecture of the buildings. The accompanying reproduction (see inset sheet) will give a good idea of the external architecture. Reproductions are also given herewith of Mr. Emerson's designs for a palace for the late Maharajah of Bhaunagar,

him in Queen's Gate (with its fine billiard room in panelled cedar), and of his drawings for the proposed Liverpool Cathedral. It is not surprising that the president looks with favour upon his cathedral design, for it has a very large measure of that romantic mystery which is the charm of Gothic. The great dome in front of the choir is as fine as it is strikingly original in conception. The reader can gain some idea of Mr. Emerson's Gothic work at its best from the reproduction given this week. For various reasons which need not be detailed here Liverpool still awaits its cathedral, but it is probable that in the near future the question will again come to the fore, when it is to be hoped Mr. Emerson will at last gain the opportunity of putting his designs into lasting stone. St. Mary's, Brighton, is another good example of Mr. Emerson's

MR. WILLIAM EMERSON, PRESIDENT F.R.I.B.A.

which is interesting for its Oriental beauty. The building itself, however, owing to the sudden death of the late Maharajah, has not yet been erected.

Mr. Emerson altogether did a considerable amount of work for this Indian prince, but his work during his sojourn in India was not all in Oriental styles. Several English churches in Western India are from his hand, perhaps the most conspicuous being the Gothic cathedral of the diocese of Lucknow at Allahabad. Before dismissing this part of the president's work, it may be said in brief that Mr. Emerson found great pleasure in the designing of Oriental buildings, the necessary verandahs and other covered ways for admitting air, producing interesting arcaded effects, of which, it is evident, Mr. Emerson took full advantage.

Of his work in England, since his return from India, mention may be made of his Hamilton House and the house erected by

best work. The stalls, pulpit, and font are all excellently done.

Though his early prejudices were all in favour of Gothic, Mr. Emerson takes anything but a one-sided view of the present vexed question as to the suitability of Gothic or Classic for modern town architecture. Both styles are imperfectly adapted to modern needs, especially in the matter of fenestration, and, in his recent address, after speaking of the Classic period of the present century and the ensuing Gothic revival period, the president added: "In the third distinctive period of the century we see architects abandoning purism and betaking themselves to an eclectic treatment of the two great branches of style. May we not hope that along this line a national architecture may eventually be reached, at once good in an artistic sense and flexible and useful from a practical point of view?"

TAXATION ON RATABLE PROPERTY.*

By HENRY J. SABIN.

THE phenomenal fall in farm rents and the increased and increasing requirements of urban authorities have combined to re-arouse and to deepen the interest in economic questions involved in the incidence of imperial and local taxation on ratable properties. This taxation is levied upon an occupier, not in any visible relation to his income or to his real ability to pay, but in relation to a yearly sum payable, or deemed to be payable, to another party. If it be true, in the strictest sense, that taxes are levied on persons, not on things, that "it is not property which is taxed, but the person or persons who are in enjoyment of it," who is it that pays taxes and rates on houses and land? The party who has the pleasure of paying, or the party who has the enjoyment of ownership? If it is a divisible burden, what principles, if any, govern its division? Questions

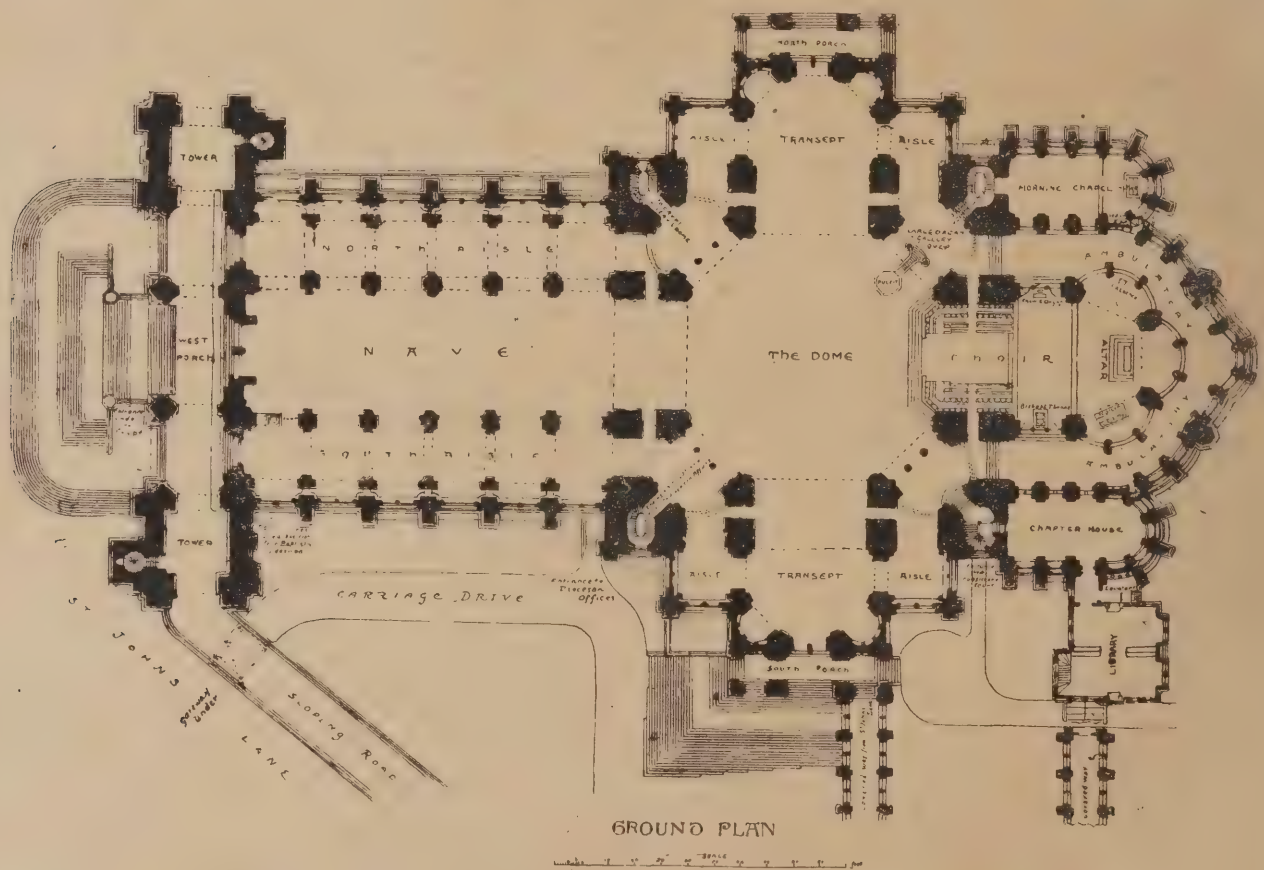

However, much of the outlay is unavoidable, and the Royal Commission in search of information for a final report has obtained assistance to that end and has published in Blue Book C. 9528, 1899, a memorandum by Sir E. W. Hamilton, K.C.B., himself one of the Royal Commission, and observations by financial and economic experts in reply to questions submitted to them. No such array of valuable material on the subject of the true incidence of taxation has been brought together in convenient form before.

In discussing the incidence of taxation as surveyors rather than as students of political economy, acquaintance with the relationship between landlord and tenant leads, I suggest, to this important general conclusion: that the closer the economic contact between the taxpayer and the party who can be finally made to share the burden, (1) the greater will be the proportion shifted, (2) the quicker will be the process, (3) the smaller will be the loss by friction, and (4) the higher will be the percentage of the final impost that will accrue to the rating authority.

In considering the true incidence of taxation

house is built and while the house is vacant. It is, in fact, created by the occupier in the act of occupying, and is collected by him along with a tax which he deducts from his rent. As he has no authority to deduct the house tax, the first inference is that the occupier pays it as in the nature of an income tax, according to Mr. Blunden's view, and that it does not fall upon the owner as averred by Mr. G. L. Gomme. Most authorities agree that it comes under the head of a tax on commodities, "theoretically a house being regarded as a sort of product grown upon the land." I suggest that in respect of houses well above the limits of remission or exemption, and where the tax actually reduces the amount available for outlay on other necessities or on luxuries, the house duty may be in some sort an income tax, but that this is less likely to be case in houses below £65 rental, or in respect of the whole tax in any case.

That a house tax diminishes the demand for sites, as predicated by Professor Edgeworth, is borne out by experience in provincial towns; it scarcely applies in London. In such towns sites for houses below the exemption

PROPOSED LIVERPOOL CATHEDRAL: GROUND PLAN. WILLIAM EMERSON, ARCHITECT.

tions such as these are not "mere theoretical conundrums," they are interesting economic problems, and they bear so directly on the work of land agents and surveyors that we ought to be competent to form opinions in regard to them, not cast in the mould of a narrow, professional prejudice, but shaped by experience and strengthened by a knowledge of facts relating to the buying, selling and letting, of the things rated.

While it is alleged that the method of raising funds for local purposes by rating is faulty, inasmuch as there is no security of "ability to pay"—the essence of equality in taxation—most of the remedies adopted, and some of those proposed, have equivalent faults. In fifty years rates, tolls and dues raised by local authorities, and taxation raised for local purposes by Parliament, have risen from about fifteen millions to about fifty-five millions; while the proportion of the parliamentary share has risen from one-twentieth of the local share raised by rates to more than one-fifth.

* Résumé of a paper read before the Surveyors' Institution on March 26th, 1900.

on houses we must differentiate between the building and the land. Together they are in law real property; in political economy the land is, the house is not; it is consumable and a commodity. Our conclusions may therefore vary according to the view we take of the true ownership of the house as distinct from its site. It is held, at first sight paradoxically, that an occupier of a house is the owner of the commodity, purchasing it for the period during which he pays rent; that therefore whether taxes fall on real property or on commodities, tenants of houses have to bear taxation actually as well as apparently. But if the tenant be a purchaser of the user on a limited hire system, the article purchased is diminished in value by the impost upon it, and the vendor (the landlord) is therefore the loser in the transaction and actually bears the tax.

The problem will have more light thrown upon it when we consider: What is the real incidence of (a) the Inhabited House Duty? This tax is levied on the united value of land and house; it is non-existent both until the

figure are saleable and fetch higher prices than sites for higher rented houses, and this, I think, quite apart from any other considerations. The freeholder, of course, will neither gain nor lose if he be a mere rent-charger, but in respect of land to be marketed, freeholders in general would gain or lose in price, or rental, a part of the tax remitted or imposed. We are justified therefore in inferring that owners do bear part of a tax levied upon land applied to a specific use, such as building houses.

Sub-question (b) makes the same enquiry as to rates on houses and trade premises. This question is not encumbered by the introduction of the disturbing factor of remissions. The general arguments used in the last enquiry apply to all ordinary rates so far as they are uniform, and in respect of burdensome as distinguished from beneficial charges. Political economists may distinguish between imperial taxes and local rates. An agent does not ordinarily do so when letting premises.

In London we are (1) greatly under the influence, benignant or otherwise, of the lease-

hold system, and (2) possess, much more acutely than in other cities, certain districts which are, as it were, centres of gravity for values. At such centres there is an absolute monopoly of a certain quality of building space. Monopolists cannot transfer to others the whole of a burden primarily laid upon them or theirs, and this will follow:—The rents of sites and of houses at such points as Threadneedle Street and Grosvenor Square will be enhanced by the fact that only the most profitable businesses and the richest tenants can pay the rents that can there be demanded; they will be reduced by a proportion of the rates and taxes attaching to the limited area included in the monopoly, reaching practically the whole at the centre. As such centres are receded from, centrifugal force is exerted and values diminish until the limit of building is reached. At or beyond the limit the land, as regards building value, is stricken with sterility; inside the limit the owner will have the potential value reduced by no more than the proportion of the tax on the ground value. Outside the limit entirely new conditions arise.

It would be idle to assume that rates for real services all equally fall on the house-owner or landowner. It requires a stretch of imagination to admit that the cost of cleaning the streets of snow has become a rate falling entirely on owners because an Act of Parliament has relieved the occupier of the normal duty of keeping his own doorstep clean and placed it upon the local authorities. Yet it is clear that if the duty had been placed upon one parish and not upon another, the tendency would have been to depreciate the value of houses in the extra-rated parish, unless—a very unlikely case—the whole management of the parish was so good as to attract cleaner and more respectable occupiers prepared to pay for the benefits. It may be, too, that in some districts a free football ground would be deemed worth paying for, and in others that a free library was of value. I believe it is therefore safe to assume that, apart, of course, from so-called "rates" for water and other purely valuable services, payments for benefits do not immediately or always affect rents, and that they should not, being properly occupiers' charges.

One of the difficulties in providing labourers' cottages is that the outlay will not bear a return on the lowest remunerative scale, partly on account of the rates to which they become subject when erected. Professor Marshall's suggestion for a remission of rates on improvements for a period is a valuable one, whatever the prospects of its acceptance may be. I hold that rates on farm rents fall on landlords, subject to the resistance of existing contracts in the case of new or increased imposts.

Should ground values be separately rated for local purposes, and, if so, on what principles? This subject had considerable attention from the Town Holdings Committee. Sites, or ground values, already bear a share of rates, they cannot escape the initial load of rating, and when first fixed in respect of any leasehold property they were deprived, not unjustly, of their highest potential amount by the rates of the locality.

Apart from rating purposes, two reasons are urged for a separation of site values. First, to remedy an injustice in regard to deductions for repairs where the ground rent is an appreciable part of the value. At present premises rated to say £900 a year gross, with a ground rent of say £300, receive an allowance of one-sixth and are rated net at £750; whereas the building alone being subject to decay, and the sixth being a maximum allowance and always granted, the reduction should be allowed on £600 only and the net be fixed at £800. Such a method of adjusting inequalities that will occur to any of us would not of itself be unfair, and would be preferable to an invidious and expensive examination of premises for the purpose of determining what should be allowed in each case—a method that would put a premium on neglect and make dilapidations remunerative.

Secondly: It is proposed to place site values on the rate list to secure a remission of house duty on that part of the total annual value; inasmuch as a house duty becomes an onerous land tax when levied in respect of anything more than the house itself. However desirable this remission might be, it would clearly not be consistent with the views of those who desire to see the site value taxed *per se*. If the house duty were transferred to local authorities there would be less reason for this separation, as relief would be given to this extent to local charges and the proportion chargeable to sites might be deemed to be a tax on ground values.

I am at one with Mr. Blunden in believing that it is not so much in rural districts as in great towns and some smaller ones that the pressure of rates and rent is felt. While I cannot, however, admit that because the final incidence of a rate is long delayed its natural and inevitable resting place is not equally on owners, there is much more reason for intervention on behalf of urban ratepayers to secure relief while economic laws are working. It appears to me sound policy to hasten the incidence to its final goal by all equitable and honest means, and I am satisfied that owners would gain rather than lose by an early transfer of their just burden. Anything which

ST. MARY'S CHURCH, BRIGHTON: GROUND PLAN. WILLIAM EMERSON, ARCHITECT.

raises the physical or moral tone of a community, and which enables its members to successfully compete with outsiders, must tend to the benefit of the capitalist. But other capitalists than the owners of the land are benefited, and I am entirely puzzled by an argument which suggests that a great public good, such as extended education or the provision for a nation's poor, should be made to fall absolutely upon the ground rent or land-owners.

SOME COMPARISONS OF GRAPHIC STATICS APPLIED TO ROOFS.*

By HENRY ADAMS, M.I.C.E., M.I.M.E., F.S.I.

I PROPOSE now to deal with some elementary work in graphic statics, which may be more or less known already to many of you, but I hope to be able to put it in such a way that new points of usefulness may be brought out; and as I want to build up the work from simple data, I must begin at the beginning and endeavour to explain it so that those who have absolutely no knowledge of the subject will be able to grasp it and afterwards turn it to practical use. We all have an idea of what is meant by force, but the greatest scientific men of the day are unable to give a definition of it that is quite satisfactory; for our present purpose we may look upon it as pressure that will produce movement if it gets the chance. Now, to fix upon paper what we mean by any given force, we must have four items of information:—(1). *Its magnitude*.—This is shown by the length of a line drawn to some suitable scale, as 1 in. to 1 ton. (2). *Its direction*.—This is shown by the position of the line, whether up or down, horizontal or sloping, and if the latter, how much. (3). *Its sense*.—This is shown by an arrow head placed on the line of direction, to show towards which end it is pushing. (4). *Its point of application*.—This is where the force is to be placed with regard to something else.

Let us represent three forces, A, B, C, acting upon a particle O, Fig. 1. A and B may act at right angles to each other or in any other direction, and then C may be put in such a position that it will just balance the other two. If now we take these three lines and

make a triangle with them (Fig. 2), taking them in order and seeing that the arrow heads run the same way round, we shall have produced what is called the triangle of forces, but I prefer to call it the reciprocal of the former diagram, and should like to mark it differently. Taking the same figure over again, let us number the spaces between the forces (Fig. 3) instead of the forces themselves; then what was before called force A will now be the force between spaces 1 and 2, or, more briefly, it will be force 1-2, force B will be 2-3, and force C 3-1. Now, to make the triangle (Fig. 4), draw a line 1-2 equal in magnitude and similar in direction to the force 1-2, line 2-3 similar to force 2-3, and line 3-1 similar to force 3-1. It is a property of reciprocal figures that lines meeting in a point in the original make a closed figure in the reciprocal, and *vice versa*. You may say you understand so far all very well, but what is the use of it? Well, suppose we only had forces A and B, that is 1-2 and 2-3, we should draw those two sides of the triangle, and the third side, or the distance and direction from 3 to 1 in Fig. 4, would give us the magnitude, direction and sense of the force required to balance the other two.

I must just say a word or two about the parallelogram of forces, and we will make use of the same three forces, A, B, C. From end of A (Fig. 5) draw a line parallel to force B, and from end of B draw a line parallel to force A. Let these intersect at D, and join D O; then A D B O is a parallelogram of the forces A and B, D O is in its diagonal or resultant, in other words a force D O would have the same identical effect as the two forces A and B together; force C is equal and opposite to the resultant and is technically called the equilibrant. These forces being in equilibrium, we might take any two of them to find the third. For instance, taking A and C in Fig. 6, O D is the resultant and B becomes the equilibrant. A simple couple-close roof truss A B C, Fig. 7, may now be taken to show the application of these principles. First, we must place arrows to show the external forces. There are two sorts, active and passive, or forces and reactions. The former are produced by the weight of the roof timbers, the covering on the roof, and the temporary loads of snow and wind pressure. The reactions are the forces supporting the ends of the truss, according to one of Newton's laws, which says, "Action and reaction are equal and opposite." If you press your hand down upon the table the table is pressing up against your hand with an equal force, not theoretically so only, but actually and practically, as would be visible to you if the table were made of soft india-rubber.

The load acts all the way along the rafters and produces a bending or cross strain. This cross strain is sometimes a very serious matter, and it is one of the defects of reciprocal diagrams that they cannot take any account of cross strains, so we must put the arrows representing the external forces of the load at those points where the rafters are supported, namely, at A, B and C. If the total load be taken as equal to unity, then $\frac{1}{2}$ will be at A, $\frac{2}{3}$ or $\frac{1}{3}$ at B, and $\frac{1}{3}$ at C, while the reactions at A and C will each be $\frac{1}{2}$. To work this case by parallelogram of forces we have first three forces meeting at A, as shown in Fig. 8, two of which are known and two unknown. The two known forces are the load 1-2 and the reaction 5-1 which are partly neutralising each other, leaving the balance A $a=\frac{1}{2}$ to act through the truss. Complete the parallelogram as shown, cutting off the lines 2-6 and 6-5 in the points b and c. The distances A b and A c show the amount of force in those two directions to produce the known balance of load and reaction A a, and gives, therefore, the stress in those two parts of the truss. But the sense of the two forces is different, as shown by the arrow heads, the rafter being in compression and the tie in tension, because the arrows are acting respectively towards and away from the joint. At the ridge we have the three forces shown in Fig. 9. The amount of 2-3 is known to be half, and as this is the equilibrant at the joint, produce the line downwards to give an equal and opposite force which shall be the resultant of 3-6, 6-2. Complete the parallelogram, when the proof of accuracy will be that the force now found necessary in 6-2 will equal what was found to be required in Fig. 8. We have found no difficulty because we took a very simple figure, but easy as the working may be, it is easier by the method of reciprocal diagram. Fig. 7 is called the frame diagram, and this is always drawn before commencing the reciprocal or stress diagram. The stress diagram begins with the line of loads as in Fig. 10, 1-2, 2-3, 3-4, 4-5, 5-1 forming a closed polygon bounded by the junctions 1, 2, 3, 4, 5, 1, and looking like one straight line, because the parts overlap. Next we want the stress in 2-6 and 6-5, so working from the known to the unknown we draw lines from points 2 and 5 parallel to these parts, giving point 6 by their intersection. Having point 6, we now join 6 and 3, and the whole figure is completed. By using the same scale with which the line of loads was drawn, we can measure off the lengths of 2-6, 6-5, 3-6 in Fig. 10, and that will give us the stresses in those parts. The nature of the stress, whether tension or compression, will be found by tracing the concu-

Correspondence.

Valuation of Houses (Repairs and Empties.)

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I regret having to encroach further upon your space, but Mr. Brand's explanatory letter affords such abundant occasion for criticism that some comment seems desirable. I will, however, be as brief as possible. I would first assure that gentleman that in drawing attention to some indisputable facts (on p. 59 of your issue of February 28th) my object was not so much to question his statements (p. 26, February 14th) as to utter a protest against a general practice that I feel to be discreditable; his statements being merely the occasion and not the cause of my letter. His position is, however, a little obscure, as he first commends and then opposes my attitude—twice impressing your readers that "it is as easy to paint the picture black as to gold." This may be a truism, but it is not true in the case of the house agent, for it seems to be much easier for him to whitewash or "to gold" the picture.

Mr. Brand's justification of what I have shown to be inadequate figures may be shortly stated:—1. That the expenses and risks of house property are so variable that no one can "venture to estimate a fair average" upon property in general or upon a suppositious case. 2. That the percentages given were only in illustration of the methods of valuing, and not in any way intended to represent an average of fact; in other words, that reasonable figures are immaterial. I do not agree, for nothing is more distressing to the struggling student than to meet with puzzling inconsistencies; and Mr. Brand should—as he easily could—have quoted reasonable averages. I have never seen any examples in any text-book that did not have a colour of probability. His explanation—No. 1 above—as to the uncertainty of things is quite beside the point, and not borne out by the facts which he himself shows by quoting other persons' general averages. Exceptional cases are, of course, to be met with, but every surveyor knows that there is a well-defined area of averages—say, from 10 per cent. to 25 per cent. for repairs; and I go further and say that it is practically impossible for any expert breathing the daily atmosphere of valuations to quote other than a reasonable average (e.g., 15 per cent. for repairs and 8 per cent. for empties in such a house as instanced), even if put down hastily.

I would like to have stopped here, but Mr. Brand has taken the opportunity of "pointing out some little defects" in my letter. He objects to my deductions of 25 per cent. for repairs and 8½ per cent. for empties (a special case I quoted) as being excessive and incompatible with "the generally accepted percentage expected from house property." Is not this a little illogical? Surely these figures or any other figures—so long as they represent facts—should be, and are, perfectly compatible with "the generally accepted percentage." In the broad sense it matters not to an investor whether the proportions of outlay are 5 per cent. or 50 per cent., providing he knows it before he buys, and it is the surveyor's duty to ascertain the real facts, correctly value them, and then to advise his client honestly, although he may have to "paint the picture black" and endanger his own fees at the same time; but for his client's sake it is better to do that than to have it go black afterwards.

Mr. Brand, in referring to the heavy periodical but essential expenses on property, says that "the large estimates mentioned can never be included under the head of ordinary repairs." This may be the key of the situation, and may account for the 5 per cent. allowed by Mr. Brand as sufficient for repairs, by which is understood "ordinary" or inexpensive repairs. Should that be so, the question naturally arises: If "the large (and costly) estimates cannot come under the head of ordinary repairs," under what head do they come, and from what fund are they to be paid?

Also, why does not Mr. Brand take into account the extraordinary repairs?

Now as to taxes. I must, of course, and do, accept Mr. Brand's explanation that 5 per cent. or £5 for rates and taxes on the £100 house was "hastily assumed, and not representative," and thank him for the list of rates which that amount is supposed to include; but if he intends the 27½ per cent., or £27 10s. on a £100 house, to be a corrected average, it would not be very far out for the taxes and rates mentioned. But does he mean to say that this amount (or any other produced by the same taxes) is payable by the owner of such a house, and, therefore, to be included in the deductions of a valuation? Permit me to explain that in the absence of any agreement, certain taxes—known as landlord's taxes, such as land tax, special sewers rates, tithe-rents and property tax—are payable by the owner, but it is quite open for either landlord or tenant to pay all or any of them, excepting property tax (and recently tithes), which the landlord must pay or allow, notwithstanding any agreement to the contrary. Landlords, however, pay all rates in small or weekly properties. On the other hand, the poor rates, highway rates, education, water and some other rates are known as tenant's rates and are payable by the occupier, unless the owner contracts to pay them. But so many tenancy agreements now require the tenant to pay "all rates, taxes, charges and impositions," that it more frequently happens that the only tax the landlord has to pay, and the prospective owner to provide for, is the property tax.

I am sorry that the length of this letter precludes my traversing the arguments for and against the consideration of property tax in valuations, but it will be seen that I have not included it in the following summary, which I now submit as a better representative valuation of an average £100 house than that given by Mr. Brand:—

Gross rent	£100	0	0
Deductions:—					
Ground rent	...	£14	0	0	
Repairs, 15 per cent.	...	15	0	0	
Empties and bad debts, 7½ per cent.	...	7	10	0	
Insurance	...	1	0	0	
Property tax	...	2	15	0	
Collection, etc.	...	2	10	0	
			40	0	0
Net income	...	£60	0	0	

6 per cent. for 45 years = 15½ y.p. = £930 value of leasehold.

Mr. Brand has taken seven per cent. interest—probably to cover contingencies; I have known other men do the same thing; the principle is not good, as all contingencies should be allowed for in the deductions. The example given is assumed to be that of a house under such a modern tenancy agreement as above referred to, wherein the taxes and rates fall upon the tenant; but if there are any further charges likely to fall upon the owner, they should be included. The surveyor should also see that the conditions of the house and neighbourhood are such that the rent calculated upon is likely to be maintained, and if not, some allowance made. While regretting having covered so much paper, I have been pleased to discuss this question, but cannot continue the correspondence further.—Yours faithfully,

F. S. I.

An Industrial Exhibition at Birmingham has been opened in the Bingley Hall.

Edinburgh Architectural Association.—The members of this association recently visited St. Bridget's Church, Dalgety, and Donibristle House, under the leadership of Mr. Frank W. Simon, architect. The church is roofless and has been so frequently altered that few of the Gothic features remain. A very fine Renaissance addition at the west end consists chiefly of a room on the upper floor panelled in polished stone. The remains of Donibristle House are now a quaint ruin with two wings for offices.

rence of the lines in this manner. Suppose we take the forces meeting at point A in Fig. 7, in the reciprocal, they make the closed figure 1.2.6.5.1, and we must remember that this is a closed figure, although at first sight it does not look like it. Distorting it somewhat, or pulling it open, it is as in Fig. 11. Then we know that 1-2 is acting downwards, so we place the arrow-head accordingly; also that 5-1 is acting upwards; and the others follow concurrently as shown. As 2-6 is shown to be acting towards the joint, it represents a push or compression, and 6-5 acting away from the joint represents a pull or tension.

Now to apply the principle of moments, as another method of investigation. We will first take an illustration of a parallelogram of forces with moments in order to make the matter quite clear. In Fig. 12 the forces A D, C D meeting at point D have for their resultant, B D. If any point E be taken, the moments of the resultant B D about point E will be equal to the sum of the moments of A D, C D, about the same point. Let fall perpendiculars from the directions of these three forces on to point E, as a E, c E, b E, these will be the lever arms, and we then have B D × c E = A D × a E + C D × b E, and we get an equation, i.e., a balance on both sides of the sign =; we can omit any one component part and find it again by means of the others. Thus, if B D were missing we should find it by working out the

result of $\frac{A D \times a E + C D \times b E}{c E}$. The equi-

librant of these forces would be D F equal and opposite to B D, and its lever arm would be c E the same as for B D, because it is in the same direction although of opposite sense. The force F D tends to turn the system clockwise round E, whereas A D and C D tend to turn it the reverse, or counter clockwise. The former direction being called + and the latter — the result of any system can be worked out arithmetically to prove whether it balances. In the simple roof truss we have already been working at (Fig. 13) let us take moments about point B. The forces to consider first are the load on A, the reaction at A, and the stress in A C. $\frac{1}{2}W$ at A × $\frac{1}{2}l - \frac{1}{4}W$ at A × $\frac{1}{2}l -$ stress in A C × $\frac{1}{4}l = 0$.

or stress in A C = $\frac{\frac{1}{2}W \text{ at A} \times \frac{1}{2}l - \frac{1}{4}W \text{ at A} \times \frac{1}{2}l}{\frac{1}{4}l} = \frac{1}{4}W$.

*43 W. The stress in A B does not affect this working, because it acts through the fulcrum and does not tend to turn the bars round that point. To find the stress in A B by this method we must assume the fulcrum at, say, intersection of centre line with A C, which we will mark D (Fig. 14). Then the reaction at A and the load on A will have the same leverages as before, while the stress in A B will have the leverage D E shown in Fig. 14, which will make stress in

A B = $\frac{\frac{1}{2}W \text{ at A} \times \frac{1}{2}l - \frac{1}{4}W \text{ at A} \times \frac{1}{2}l}{D E} = \frac{1}{2}W$.

There is yet another method by which stresses in any framework may be determined. This is called the "method of sections" and is based on the principle that for equilibrium all the resolved parallel forces acting in one direction must equal all those acting in the contrary direction. In Fig. 15, draw any vertical line D E between A and B; the stress in A B may be resolved into horizontal and vertical components, but the vertical component must be equal to the loads which have to be transmitted through it. Hence stress in A B = $\frac{\frac{1}{2}W \text{ at B}}{\sin. D A E}$ or, avoiding the appearance

of trigonometry, stress in A B = $\frac{\frac{1}{2}W \text{ at B}}{\frac{D E}{A D}} = \frac{1}{2}W$ as before. The stress in A C = stress in A B × cos. B A C, which is equivalent to stress in A C = A B × $\frac{A E}{A D}$.

In these comparisons I have taken the simplest possible case, in order that anyone coming to the subject for the first time may be able to comprehend.

"BUILDERS' JOURNAL" SHILLING FUND.

A GOOD LIST THIS WEEK.

WE are glad to say that our readers are not slackening in their efforts to help in the erection of the proposed Homes for Discharged Soldiers, this week's list being one of the best we have yet had. Our offer of a copy of the current issue of "Specification," the invaluable reference book for all connected with the building trades, sold at 5s. nett, is still open to anyone who collects twenty shillings for our fund.

The following subscriptions have been received since the publication of our last list:—

The following additional contributions in money and kind have been received at the offices of the executive of the Gift:—

Messrs. John Bolding and Sons.—Sanitary fittings for one Home (except baths).
Mr. George B. Davis.—Sanitary appliances for one Service Block.
Messrs. Henry Hope and Sons.—Metal casements for one Home.
Messrs. F. C. Barron and Co.—30 tons Portland Cement.
Messrs. E. R. Burt and Sons.—20 tons Portland Cement.
The Val de Travers Asphalt Co.—500 yards super. fin. paths.
The French Asphalt Co.—Asphalt paths (main site).
Messrs. Fletcher, Russell, and Co.—Grates to the value of £50.
Mr. Alfred S. Tucker.—250ft. super. marble flooring.
Messrs. Blackburn, Starling, and Co.—Three lightning conductors.
Hard York Nonslip Stone Co.—100 cub. ft. stone.
Messrs. W. G. and L. England.—Ten patent reversible windows.
Messrs. Bryce, Junor and White.—Mouldings to the value of £10.
Mr. Robert Adams.—Door springs and fanlight openers for two Homes.
Messrs. Chas. Nelson and Co.—Thirty tons blue lias lime.
Mr. W. J. White.—10,000 red facing bricks.
Mr. Alfred S. Tucker (second gift).—Chimney-piece and stove.
Waltham Art Metal and Engineering Co.—Ornamental covers for electric light pushes and bell pushes.
Messrs. A. C. W. Hobman and Co.—Artificial stone to the value of £20.
The Chester Engineering Co.—Six large patent casements for connection corridors.
Messrs. James and Son.—The inside blades for the recreation house.
Messrs. Long and Coles.—Wrought ironwork to the value of £25.
Messrs. Bradshaw and Co.—The asphalt for roofs and footways.
Mr. Samuel E. Spencer.—Art metal work to the value of £5.
Messrs. Lancaster and Co.—One 450-gallon cistern and one hot-water cylinder.
The Lambeth Brass and Iron Co.—Steam barrel and fittings.
The Phoenix Lead Mills.—Lead pipe, soil pipe, binds, traps, Junctions, and tacks for one home.
Messrs. Rufford and Co.—Two baths.
Messrs. W. B. Bawn and Co.—One tank and cylinder.
Messrs. W. Harland and Sons.—Twenty gallons of Enamel.
Messrs. A. Emanuel and Sons.—Two porcelain baths, four w.c.s, and four lavatories, all complete with fittings.
Messrs. A. H. Lavers Limited.—The whitening for the whole of the homes.
Messrs. Lamigeon and Co.—Ten sacks marble cubes for mosaic.
Messrs. A. and J. Main and Co.—Wire fencing to the value of £20.

FOR THE ELECTRIC LIGHT INSTALLATION (per "Electrical Review").

Messrs. Dorman and Smith.—Main switch-board for electric light.
Messrs. Ward and Goldstone.—All the flexible cord required.
Messrs. McGeoch and Co.—426 5-ampere switches and accessories.

FOR THE EQUIPMENT OF THE HOMES.

Messrs. Farrow and Jackson.—The mineral water plant.
Messrs. T. and K. Boote (second gift).—Table and toilet services.

AMERICAN STEEL SKELETON
CONSTRUCTION *

By BREES VAN HOMAN, G.I.Mech.E.

THE subject of steel skeleton construction is interesting not only to the mechanical engineer but also from an architectural point of view, for in these days of large cities like London, where it is essential to economise every possible inch of area, we are beginning to find it necessary to extend our buildings vertically. It is here that one of the most important uses of skeleton construction becomes manifest, for it offers the only solution of the problem of economising space in the lower floors of high and narrow buildings. In the ordinary methods of building, the higher the wall the greater must be its thickness at the base; but though the lower storeys are necessarily the most valuable, it is in these that the greatest area of a valuable piece of land must be surrendered to enormously thick walls; so that every foot of area gained on the inside measurements increases the capacity of the structure. In buildings erected in the manner now to be described, heavy masonry walls are, of course, unknown, and what appears to be such at first sight is found on closer inspection to be a thin veneer of some fireproof material covering the steel framework which supports the building. By the term "framework" you must not for one moment imagine I mean a mere heap of girders and columns placed one upon the other at the discretion of the architect, for it is at this point we need to call in the engineer who has made a special study of all the necessary details and connections of an immense metal structure, strong enough to carry not only the direct

loads placed upon it (including the weight of the structure itself), but also capable of resisting all lateral strains to which it may be subjected.

The method of skeleton construction consists in using columns or stanchions of cast or rolled iron or steel built up to form various sections, according to requirements which I will deal with later, connected longitudinally with lattice, or, perhaps, some form of compound riveted girder at each floor level. On these girders are built the walls, which are generally of brick, from 12in. to 20in. thick, and reach from the top of one girder to the underside of the next storey girder, extending a sufficient distance outside the girder to allow it to be protected by a casing of some sort (perhaps of masonry or terra-cotta). This construction is continued until the top of the building is reached. Now, there is one point I wish to make clear, and that is, each individual wall is supported by the girder beneath it, and not by the wall on the floor below. Of course there are many possible variations to this general plan, the columns in some cases beginning in the basement and in others at the top of foundation walls at the ground-floor level. Another variation occurs where the columns and walls are separate, the walls being built of sufficient strength to carry their own weight, while the columns merely support the floors and their load. Then, again, the longitudinal girders may be placed in every second floor and the wall made 20in. to 24in. thick below the fourth and fifth tier. When this method of construction was first introduced in Chicago after the great fire, about eighteen years ago, much discussion ensued between eminent engineers as to the expansion of one material over another; but later experience has proved that neither extreme cold nor heat has any appreciable effect on the metal when it is carefully covered, as of course it should be. This special form of construction lends itself most particularly to American cities, where the streets are, one

might say, geometrically planned, a practice which greatly facilitates the work of the designer, as the buildings are for the most part rectangular..

Foundations.

The subject of foundations is rather a large one to deal with in a short paper like this, and I propose, therefore, to give you only a few methods of constructing foundations under variable conditions of soil. In the first place let us take rock. Where you have to build on rock of course very little need be done to the foundation, and it merely requires dressing and the filling-in with concrete of any fissures; but in a case where the proportion of rock is not great it should be taken out, as a mixed foundation rarely proves satisfactory, owing to unequal settlement.

As regards clay, this is not a good soil for foundations when found alone, as it gains and loses water with the seasons; but when found mixed with coarse sand or gravel it will bear nearly as great a load as some of the softer rocks.

One of the best soils for foundations has been found to be some sort of gravel soil which, when confined laterally, is not affected by water, and consequently does not become washed away. With regard to the bearing power of different soils, I cannot do better than quote from a table compiled by Mr. Ira O. Baker for his "Treatise on Masonry Construction," which you will see tabulated in Fig. 1:

DESCRIPTION OF SOIL.	BEARING POWER IN TONS PER SQ. FT.	
	MIN.	MAX.
Rock (hard)	25	80
" (soft)	5	10
Clay (on thick beds always dry) ...	4	6
" (moderately dry)	2	4
" (soft)	1	2
Gravel and coarse sand (well cemented) ...	8	10
Sand (compact)	4	6
" (clean and dry)	2	4

FIG. 1.

An easy method of determining the bearing power of the foundation bed is by means of a square platform (say 6in. square) having four legs, the load being

*A paper read before the Graduates Association of the Institution of Mechanical Engineers on March 12th, 1900.

put on gradually and frequent levels taken. One-half to one-fifth of the load required to produce settlement is generally taken as the safe load. Under ordinary conditions of building, provided you have a fair gravel soil to work on, it is generally sufficient to have plain concrete foundations something like those shown in Fig. 2, or if you have a soft subsoil it may be better to drive in piles until you reach a firmer bed beneath. These piles should be of taper form, 12in. to 20in. in diameter, and driven in from 2ft. to 3ft. apart, the spaces between the heads of the piles being filled in with concrete, say, to a depth of not less than 12in. Now the above two methods may perhaps be satisfactory for buildings from twelve to sixteen storeys high, but when you reach the height of, say, twenty storeys, it may be necessary to still further strengthen the foundations. This can be done by means of steel beams or rails in concrete. A layer of concrete not less

Fig 3 Raft System.

than 12in. thick is first laid, then a row of beams is placed on top at distances apart which should not exceed the depth of the beam, and, finally, the interspaces are filled in with concrete well rammed down. You proceed in this way for four or five layers, reducing the length of the beams each time and placing them crossways, as shown in Fig. 3. This type of foundation will take a very considerable weight, but with very tall buildings, say, of twenty-nine storeys, supported by columns or stanchions each carrying from two to three thousand tons, you may find it necessary to still further strengthen your foundations. One of the best methods of doing this is by sinking caissons, which was done for the Manhattan Building, the American Surety Building, and other large buildings in New York.

The pneumatic caissons for foundation work of buildings are made of steel plates, generally riveted together in a circular or rectangular form. The excavation is made below or in the caisson under air pressure sufficient to keep out the water which might underlie the foundations of adjoining premises. The foundations are thus carried down to the bed rock without disturbing any foundations of the surrounding buildings. When the bed rock is reached it is carefully levelled off and a massive concrete foundation, perhaps 8ft. thick, built upon it. In Chicago, owing to the peculiar nature of the soil, which is fairly firm to a depth of 12ft. to 15ft. and more but has

below this a very soft clay soil, the raft method of steel beams in concrete was often adopted, allowing for a considerable ultimate settlement (sometimes as much as 12in. in the building); but the difficulty in this case was that owing to the difference in the bearing power of the soil under different parts of the building it was found very difficult to determine how much to allow for this ultimate settlement. The pile method was also used to a considerable extent in that city.

Before concluding my remarks on foundations, I would refer to a few laws which have been lately published in the New York Building Act relating to the computation of loads. These loads are divided into two branches—the dead load, comprising the whole weight of the building itself, and the live load, which consists of the greatest load it will be assumed to carry when in occupation. In warehouse or factory buildings more than three storeys high, the foundations must be constructed to carry the full dead load and the full live load. In shops and buildings for light manufactures, the full dead load and 75 per cent. of the live load (this also applies to schools and places of public assembly). But in ordinary dwellings and office buildings the full dead load and only 60 per cent. of the live load need be taken. The reason of this is clearly apparent, for supposing the floors were designed to carry 100 lb. per foot super, it is highly improbable that the whole of the floor area in the building would ever be likely to receive that load at one time, and it is for that reason that the above reductions are made. Of course, care must be taken in designing the foundations to distribute the loads as uniformly as possible so as not to exceed the bearing power of the soil. When the foundations are carried down through the earth by piers of stone, brick, or concrete in caissons, the load must not exceed 15 tons to the square foot when carried down to rock, 10 tons to the square foot when carried down to firm gravel or hard clay, and 8 tons where piles are used and driven down to the bed rock.

Columns and Stanchions.

The use of cast-iron columns in connection with skeleton construction has of late years been slowly dying out and is being replaced by rolled-steel stanchions, the chief disadvantages of cast-iron in high and narrow buildings being the uncertainty of the strength of the material where connections have to be made with the floor and wall girders, and the liability of the lugs or brackets to break completely off, which, of course, might be very serious. In fact, cast-iron is always such a treacherous material that even with the most careful design the uneven contraction in cooling may set up stresses so great that a slight

Caisson Foundation

addition to the superincumbent load may cause fracture; hence in practice it is usual to allow a very large factor of safety, say, from one-sixth to one-tenth as against one-third to one-fourth in steel; so that steel is not merely the more reliable, but also the cheaper material. Cast-iron girders are now things of the past, and cast-iron columns will soon be equally rare. Columns made of rolled iron or steel, shaped as shown in Fig. 4, have, on account of their expense in manufacture, almost entirely gone out of use. Another great objection to them is the inability of access to the inside for painting or inspection, and also the difficulty of making suitable connections to the floor and wall girders. The most usual method is the build-

ing-up of stanchions composed of angles, channels, plates, Z-bars or I-sections; the last is now very much used. These five sections are built up in various forms, according to requirements, some of the most common being shown in Figs. 5 to 12. In Fig. 5 you have a section built up of four angles. I do not consider this a good section, as it is a well-known fact that the metal near the neutral axis of a stanchion is of little use, and that the capacity of equal areas varies as the metal is removed from the neutral axis. It seems, therefore, that a better form might be adopted which would meet the requirements of the case. In Fig. 6 is shown a section built up of angle irons and plates, a very common section, but one that costs more to manufacture than the section shown at Fig. 7, as it requires six lines of rivets, whereas in Fig. 7 only four lines are required. Fig. 8 is very similar to Fig. 7, but of greater strength. Figs. 9, 10, and 11 are rather more expensive sections, as the channels cost more to roll, and considerable difficulty is sometimes experienced in obtaining them from the mills when a certain weight and area are required,

and stanchions, the New York Building Act states that where these are used to support iron or steel girders carrying walls they shall be made of cast-iron, wrought-iron, or rolled steel, and on their exposed outer or inner surfaces shall be constructed to resist fire by having a casing of brickwork not less than 4 in. thick and bonded into the brickwork of the adjoining walls. In many cases porous terra-cotta tiles with hollow spaces and set in Portland cement

Fig 15
Cast Iron Separator

are employed, but the brick is the cheaper method and can be accomplished during the building of the walls of the structure. Another method is to use some sort of metallic lathing covered with a plaster made of Portland cement, but in this case the law requires you to put on a second or outside additional covering, having an air space between of not less than 1 in. The chief requirement in fireproofing is to employ some material which shall be as far as possible a non-conductor of heat, such as brick, terra-cotta, plaster, and sometimes asbestos, though the cost of the last-named material precludes its extensive use.

Girders.

The most ordinary form of girder for short spans is the I-section. This may be doubled and separators placed in between, generally about 5 ft. apart, as shown in Fig. 15. A still stronger form may be made of plates and angles, which may also be doubled and additional plates added, bringing the section up to form shown in Fig. 14; or the girder may be deepened, which gives a considerably greater stiffness to the building. Some of the heaviest girders for the Park Row Building, in New York, were made 96 in. deep, having four web plates $\frac{1}{2}$ in. thick with eight angles 6 in. by 6 in. by $\frac{1}{2}$ in. thick, and were designed to carry a load of nearly 3,000 tons. One of the most important points in designing main girders is to have good connections to the columns or stanchions at the different floor levels, for it is these main girders that give the lateral bracing to the whole building and help to transmit to the columns a certain proportion of the wind pressure.

Connections.

The usual method of joining stanchions is by fish and cover plates. It is not necessary to go to the expense of making caps and bases to each separate stanchion, placing one on the other and then bolting together, as is very often done in this country. Connections are made at every two or three storeys, say a third of the whole number of stanchions spread over the ground floor may be joined at the first floor, a third at the second, and the remainder at the third floor so as to avoid too many joints occurring at one level, which would be likely to weaken the building. The joints in the stanchions are generally placed just above the floor level in order that they shall not interfere in any way with the connections to the main girders carrying the floors and walls. Concerning the connections of main girders to stanchions, in the case of box girders it is usual to support them on angle-iron brackets riveted on the stanchions, on the top of which the girder is bolted down. In addition to this an angle-iron cleat is riveted on the end of the girder, which is riveted or bolted to the stanchion when in position, as shown at Fig. 13. The small lacing joists running be-

tween the main girders, which are generally used to carry the terra-cotta tiles for the fire-proof floors, may rest on angle-irons riveted to the webs of the main girders at a suitable level, which is better than running them over the top of the girders, as the floor is then within the depth of the girder and consequently the latter does not project so much below the ceiling; this is rather important, as the head room in a building of this type is limited. It is not necessary to connect every one of these small joists, as they are kept in position by the concrete in the floor, and it is generally found sufficient to bolt up every fourth or sixth one—just enough to form an additional tie and to brace up the main girders.

Painting.

This is seemingly an unimportant item in steel or iron construction, but it is one that should always receive proper consideration and should on no account be omitted, as it very often is when a column or lintel is to be built into a wall or otherwise hidden from view; for it is absolutely essential for the preservation of the iron or steel that it should be properly covered with a good sound paint. In the first place, the steel should be carefully cleaned (by scraping or the use of a wire brush) from all rust, scale, dirt, &c., and should receive one coat of metallic paint and pure linseed oil. It is also a good plan to give a light coat of boiled linseed oil to all surfaces before they are riveted together. This first coat should be given to the different parts whilst they are in the works, and should be allowed to thoroughly set before the parts are removed. All machined surfaces should be covered with a coating of white lead and tallow; in the case of cast-iron it is sufficient to give a heavy coat of boiled linseed oil and to brush it well in. When all the parts have been finally fixed in position, the whole structure should receive another two coats of metallic paint, care being taken to let the first set thoroughly before applying the second. In using the term "metallic paint" I wish to imply the use of either oxide of iron or oxide of lead, both of which are very good, some engineers preferring one and some the other. On the whole I should advise the use of oxide of iron for the first coat and oxide of lead for the two last; but it is purely a matter of opinion. There are a few engineers who use quick-drying paints in order that they may expedite the delivery of material from the works to the site, but these paints are always most unsatisfactory, owing to their being made up with benzine and other similar spirits, which, instead of setting hard and adhering well to the metal, dry and crumble into powder in the course of a few months. A good metallic oil paint should not set in less than thirty hours.

Floor Loads.

In calculating the floor loads it is impossible for me to give you any hard and fast rule, for it depends in the first place on what the building is proposed to be used for, and in the second place on where it is going to be erected. In large cities like New York and Chicago they each have their own building regulations, formulated by a Council, who determine what the floors must be constructed to carry, this, of course, varying according to the description of the building.

Some rather interesting experiments were made some time ago by Messrs. Blackall and Everitt, a firm of Boston architects, as to the actual loads on floors, or what we call live loads. They took three large buildings the rooms of which were let out as offices, and after calculating the weights of the persons, furniture, stores, and movable goods occupying the premises, they found that the average load was only 33-3 lbs. per square foot. Now, the Boston Building Law requires you to construct office floors to carry 100 lbs. per square foot, which appears to be a rather large margin. In New York they must be calculated to carry 75 lbs. per foot super; in Chicago, 70 lbs.; although Mr. Birkmire in his book on "High Office Buildings" considers 50 lbs. sufficient; but this seems to be cutting it rather fine. In the London Building Act nothing is mentioned concerning this matter, so that I presume it is left to the discretion of the district surveyor

the demand for them being different to that for angles. The same remarks may also be applied to the Z-bar sections shown at Fig. 12, although this particular section is used to a much greater extent in America than in this country. But for ordinary purposes the I-section shown at Fig. 8 is usually adopted, as it is easily strengthened by employing additional plates, has only four lines of rivets, facilitates connections (as shown at Fig. 13), and is comparatively cheap to produce. Where you require a stanchion to carry a very great load, say 3,000 tons, it will perhaps be cheaper to build one in the form shown at Fig. 14.

In reference to the fireproofing of columns

as acting representative of the London County Council. For places of public assembly in New York 90lbs. is taken; for shops and light manufacturing premises, 120lbs.; and for warehouses, 150lbs. or more, according to the nature of the goods to be stored.

In the case of a factory intended to carry running machinery, the load must be increased in proportion to the degree of vibratory impulse liable to be transmitted to the floor. With reference to dead loads, these again vary to a great extent. The hollow-tile floor illustrated at Figs. 16 when made 6in. thick, the aggregate for the concrete being of ordinary ballast, weighs 60lbs. to the foot, including the plaster. You then have to take into account the light partitions coming on the floor, for which you might allow an additional 20lbs., and, say, 10lbs. for the finish, which is sometimes of wood block, floor boards, and fillets, mosaic, &c.; this brings up the total dead load to 90lbs. per square foot, which, I think, may be taken as an average weight

Fig. 16

Fig. 17

Solid Brick Floor.

for a floor of that description. In computing the weight of walls, brickwork is taken at 115lbs. and granite and other kinds of stone at 170lbs. per cubic foot. In calculating these floor loads it is essential to make them just strong enough and no more, not only for economy but in order to reduce the dead loads on the foundations as much as possible. The construction should be just as light as is consistent with perfect stability. In America it is the usual practice to allow the minimum of about 75lbs. for the upper floors, 85lbs. or 90lbs. for lower floors (say below the fourth storey), increasing the first and second floors from 150lbs. to 170lbs. per square foot, which may be taken as the computed live loads.

Fireproof Floors and Roofs.

I intend to deal with these two items in skeleton construction at the same time, because most buildings of this type are constructed with flat roofs, so that what applies to one will apply equally to the other; of course, the roof need not necessarily be made flat; the Washington Life Building is a very fine example in the other style. Mr. J. J. Webster, M.Inst.C.E., in his paper on "Fireproof Construction," says:—"There is of course no such thing as a fireproof structure, if the phrase be taken in a strictly literal sense, no known substance being able to resist a change of state when submitted to an intense heat." This is true, but these high buildings are practically fireproof in the sense that they will safely resist any fire which can exist in or around them.

At Fig. 18 is shown a typical fireproof floor as used in America. Hollow bricks or voussoirs are placed between the girders as

Fig. 18

shown, the number and sizes varying with the span. Iron tie-rods connecting the girders are fixed at intervals of a few feet, and concrete is laid on the top of the bricks to a depth of 3in. or more. In the construction of this floor it is necessary to use temporary centering. The concrete may be composed of concrete or some form of ballast, the former being the better if it is intended to finish the floor with floor boards and fillets as it is lighter and more convenient for the nailing down of the fillets. If it is proposed to use coke-breeze, it is absolutely essential to mix with it a fair proportion of coarse sand, say one-fifth to one-third, according to the quality and texture of the breeze. The London jerry-builder very often omits to do this, and he is thus constructing a so-called fireproof floor of the same material that is used on the Continent as a patent fuel. It must always be borne in mind that any concrete formed with Portland cement will only resist fire for a time; hence the importance of supporting it with a fireclay brick, a material which is practically indestructible by fire.

Of course you occasionally hear of a fire-resisting building being destroyed by fire, but then, I think, you will always find it due to some defect in the fireproofing, as was the case with the Chicago Athletic Club, in which the columns gave way. Wooden strips had been wedged between the flanges of the columns every 3ft. or 4ft., and the fireproofing built between them. These strips were burnt out and the fireproofing fell to the floor. But now that we realise what an important point proper fireproofing really is, such faulty construction would never be for one moment entertained. According to the New York Building Act, "when the height of a fireproof building exceeds twelve storeys, or 150ft., the floor surfaces shall be of stone, cement, tiling, or some similar incombustible material, or, if of wood, must be treated by some satisfactory process which shall render it fireproof."

Wind Pressure.

This is a very difficult subject to deal with owing to the absence of really trustworthy experiments which can prove what is the greatest force the wind is likely to exert in the various sites on which buildings are proposed to be erected. It is generally considered that in America the velocity of the wind is not so great as in Great Britain, excepting, perhaps, in the case of tempests of the most unusual and violent kind, such as that which occurred in St. Louis in 1895, the force of which Mr. Stobel (in a letter read before the Institute of Civil Engineers) likened to that arising from an earthquake. It is therefore probably not necessary in a compact city such as Chicago or New York to construct wind-bracing to resist such enormous pressures. The New York Building Act states that in buildings less than 100ft. high, provided the height does not exceed four times the average width of the base, the wind pressure may be disregarded, but that all structures more than 100ft. high exposed to the wind must be designed to resist a horizontal wind pressure of 30lbs. per square foot of surface exposed. This may be done in two ways, one method being to insert a system of diagonal tie-rods which really form a system of trusses whose depth is the width of the building; the objection to this system is that the rods are very liable to interfere with the window openings. By another method portals made of steel web-plates are used, with angles connecting the vertical stanchions, but this is more expensive and throws bending stresses on the stanchions at the corners of the building which must be taken up by the longitudinal girders. The usual method is merely to

deepen the girders and strengthen the connections to the stanchions.

Simplicity of Construction.

One of the chief advantages of this style of building is the rapidity with which it is erected. This is made possible by the great similarity of one floor to another right throughout the building, and the geometrical lines on which it is planned. An office building of fifteen or sixteen storeys can be erected and ready for occupation in from seven months to a year. The weight of the steel framework varies from 1½lbs. to 2lbs. per cubic foot, and costs in America from 2½d. to 3d. per cubic foot, being about one-seventh to one-ninth of the cost of the building. The tendency in London is to increase the height of our buildings. Any casual observer must be struck by the fact that nearly every new building is taller than its neighbours, and no doubt if all restrictions were removed by the London County Council the same causes that have created the "sky-scraper" in America would bring about a similar result in this country.

NO. 17, FLEET STREET.

THE report of the General Purposes Committee asking the London County Council to sanction the expenditure of a sum not exceeding £27,300 for the acquisition of the freehold of this building, and for their restoration, was crowded out at the last meeting. The house is described by lettering displayed on its front as the Palace of Henry the Eighth and Cardinal Wolsey. "This," the Committee point out, "is an incorrect description, as the house was built in the reign of James the First—about the year 1610—for Henry, Prince of Wales, as an officer of the Duchy of Cornwall. It continued to be used as offices of the Duchy until the death of the Prince in 1612, and probably after that date; but not long subsequently it was converted into a tavern and has since been used for business purposes. This house represents an almost unique specimen of its kind of the architecture of the period, and the ceiling of the room on the first floor has been described as the finest remaining in situ in London; the wood paneling, moreover, comprises some exceedingly good carving." The Council's architect has made a thorough survey of the building and it has been definitely ascertained that the existing front, as visible from the street, is merely a false screen, and that the original front is, on the first floor, some 20in. behind this. The old carved pilasters which were on the original front are still in existence. "It is proposed," the Committee say, "that the ground floor only shall be set back to the line of the street improvement, the upper floors remaining in their present position and being supported on cantilevers; the front of the house to be restored to its original condition (the false front being removed), and the back portion of the premises (which has already been demolished) rebuilt. The price asked for the freehold is £20,000, to which must be added a further sum of £300 for costs, and the amount of the architect's estimate for rebuilding the back and restoring the front of the building £7,000; making a total outlay of £27,300. Against this sum must be set (1) the promised contribution of the City Corporation of £2,500; (2) the sum which will be contributed in respect of the widening of the roadway, and (3) the rent which the Council will receive in respect of the premises. The net result shows that the scheme of preservation would cost the Council the sum of, on an average, £172 a year for 59 years, after which period the premises would be a valuable asset in the hands of the Council and would be free of the charge. This allows for the historic room on the first floor being reserved for the public benefit. . . . We may add, in view of a suggestion which has been made that the whole house should be rolled bodily back, that the architect has reported on this point, and he states that, if this suggestion were adopted, the cost would be £2,000 more than the scheme which we now put forward."

R.I.B.A.

ARTISANS' DWELLINGS.

A MEETING of the Royal Institute of British Architects was held on Monday evening, when Mr. J. M. Brydon (vice-president) occupied the chair. Mr. Alexander Graham announced with much regret the deaths of Mr. F. W. Steevens, the eminent Indian architect and engineer, Mr. E. J. Lowther, Mr. Charles H. Purday, and Mr. W. J. Anderson, and it was agreed that a letter of condolence should in each case be sent to the relatives. Papers by Mr. John Honeyman, R.S.A., Mr. Henry Spalding, Mr. W. E. Wallis, and Mr. Owen Fleming on working-class dwellings were then read.

Mr. Honeyman's Paper.

Mr. Honeyman, discussing the effect of injudicious legislation in the matter of building regulation, said that local authorities seemed to ignore the fact that the more their restrictions as regards number of storeys, height of ceilings, width of passages, &c., increased the cost of the dwellings, the higher must be the rent. Dwellings of the early Peabody type, though the ceilings were low and the buildings high, were perfectly healthy, the death rate being lower than the average. The building regulations of most of the large provincial cities made the erection of dwellings at moderate rents impossible. The artisan class was sufficiently catered for. The great and growing difficulty was the provision of wholesome houses for unskilled labourers and the poor, whose earnings were not more than £1 a week; and not only the respectable poor, but the families of the dissolute, the intemperate, and even the criminal. As modern regulations made the erection of dwellings for the poorest class unremunerative to private enterprise, the municipality itself should undertake the work. But municipal corporations failed to recognise their responsibility. The author gave Glasgow as an instance. To meet the immediate needs of that city 2,000 dwellings were required, with an annual addition of 200 more to keep pace with the increase of population. The corporation, however, had confined itself to the erection of a class of dwellings which could be provided without their assistance, with the result that in 1898, 4,642 such houses—chiefly artisans' dwellings—were tenantless. Some relaxation of present building regulations must be permitted in order to provide houses which the poor can afford to pay for. They must be content with what is essential and avoid what is merely desirable. Criticising a regulation prohibiting single-room dwellings, the author contended that for the very poor a house of one apartment for married couples and small families of young children was a perfectly suitable dwelling, both on economical and sanitary grounds. Compelling people to have more accommodation than they needed or were able to pay for only led to the overcrowding of houses by the introduction of lodgers. The lower in the social scale, the less a man could afford for rent in proportion to his income. Discussing remedies, the author said the alternative was forced upon the authorities either to relax building regulations or to supply the houses at unremunerative rates. The adoption of the latter alternative the author deprecated on economic grounds, and as increasing the burdens of the ratepayer. The difficulty, he considered, could be solved by either modifying building restrictions or exempting such houses from their operation. The principle of exemption had been recognised by the promoters of the Glasgow Building Regulations Bill now before Parliament, which proposed to empower authorities to relax or modify any enactments or by-laws in the case of blocks of labourers' dwellings containing more than twenty-four separate dwelling-houses. Similar powers might safely be entrusted to the municipalities of large cities with private Acts; in other cases the

sanction of a superior independent authority should be required.

Mr. Spalding's Paper.

Mr. Henry Spalding, whose paper dealt with the associated dwelling and self-contained tenement systems, said that however successful block buildings may have been as schemes for housing the working-classes, as re-housing schemes they had signally failed. Slums had been swept away, and the inhabitants had gone to overcrowd other places, while quite a different class of people had occupied the new buildings. The great difficulties they had to face were the ever-increasing cost of building and of obtaining land suitable for the erection of dwellings at a reasonable price. In this class of work architects must practise the most rigid economy in planning and fittings. Little money could be spared for ornamentation, but by a judicious use of the materials at their disposal a good effect could always be obtained. Block dwellings, broadly speaking, were divisible into two classes: (1) associated dwellings, in which the offices were common to two or more tenements, or, if separate, were placed in blocks away from the living rooms and approached from the staircase or corridors; (2) self-contained tenements in which all the offices were inside the front door. The associated dwellings could be made the more economical, and should be used for tenants of the poorest class. One objection to having common sculleries and w.c.'s was that a certain amount of supervision was necessary, and when two or three of the tenants were responsible, cleanliness was often neglected. If separate offices were provided for each tenement, and these were all placed in one block, accessible from the corridors, a great deal of space was taken up for which there was no return in rent. Of the two systems the author favoured the self-contained tenements, provided the class of tenants the buildings were intended for could afford the increased rent. The plan must depend upon the class of tenants to be housed. Tenements might consist of one, two, three, or even four rooms. The single-room tenements were on the associated plan. In dwellings for the poorest, sculleries were not provided, and the sink was placed in the living room. Where there was a scullery, a copper should be placed in it and balcony space provided for drying purposes. If a copper was not provided, laundries might be conveniently placed in the courtyard or in the attic storey. A convenient but less economical plan was to provide separate laundries to every five tenements. In the courtyards might be placed such buildings as workshops, where the tenants could do small repairs, and a place where tools, barrows, &c., could be stored, and, especially in dwellings of the associated type, extra urinals and w.c.'s. In both the associated and the self-contained systems the tenements might be approached direct from the staircase, or from a balcony running the entire length of the block, with two or three staircases according to the number of tenements. The author described in detail the plan and arrangements of the Oldham Road block of labourers' dwellings erected by the Manchester Corporation in 1893. The site occupies a superficial area of about 7,832 square yards, of which about 3,430 are covered by the buildings. The site is rectangular and the buildings are ranged round its four sides, leaving in the centre a spacious recreation ground. The block comprises sixteen shops and cellars, four laundries and drying-rooms, 237 two-room and 48 single-room tenements. The double tenements were for families of four or five persons, the single for one person. Details were also given of the dwellings proposed to be erected by the London County Council on the Millbank Estate, Westminster. The author laid stress on the importance of securing cross-ventilation from front to back of houses, as had been arranged in the Millbank Estate. Such tenements were far healthier than the houses usually occupied by artisans. An official report showed that during the five years 1894-98 the average death-rate in five blocks in Houndsditch was 12 per thousand, whilst for London during the same period it was 18 per thousand.

Mr. Wallis's Paper.

Mr. W. E. Wallis, who followed, gave an account of the buildings erected by the Peabody Trust. The sum left by Mr. Peabody amounted to £500,000, his object being to provide good and wholesome dwellings for the poorer working classes which could not only be let at considerably lower rents than those ordinarily charged, but would also return a fair percentage on the capital expended. That the original object was attained was shown by the fact that £1,300,000 had been spent on land and building up to the end of last year. The average weekly earnings of the head of each family in residence was £1 3s. 1d. The average rent of each dwelling was 4s. 9½d. a week, and of each room 2s. 2d. The rent included free use of water laundries, sculleries, and bathrooms. Having briefly described the earlier Peabody buildings, the author turned to those of more recent date. These were superior in every way to anything that had preceded them. The blocks are five storeys high, except the centre portion containing laundries and drying-rooms, which is six storeys. There are ten rooms on each floor, with two sculleries and two w.c.'s in well-ventilated corridors outside the dwellings. Keeping sculleries and w.c.'s outside the dwellings the author considered far better than making the dwellings self-contained. The rooms are divided into dwellings of one, two, and three rooms, and are let at average rents of 3s., 5s. 6d., and 6s. 6d. respectively. The laundries are fitted up with four sets of coppers and washing tubs, with water laid on to all. The windows are louvred, and the floors asphalted on concrete. Space is economised in corridors and passages, and ample light secured to all parts. The rooms are 8ft. 6in. in height; the living rooms 13ft. 6in. by 11ft. 9in.; bedrooms, 13ft. 6in. by 9ft. 9in. The single living rooms are 14ft. 6in. by 12ft. 6in. Dust shafts were attached to each scullery. These the author considered were far preferable to sanitary pails, both on the score of health and convenience. Dealing with ventilation, Mr. Wallis disagreed with the opinion that buildings could not possibly be healthy unless the wind could blow completely through them—an idea that had even been extended to staircases and dwelling rooms—and that bedrooms should not be entered direct from the living rooms. In deference to this view the L.C.C. architect had to provide in the Council's buildings back passages, although neither direct light nor air could be given to them. Such passages were bad in the extreme, besides adding considerably to the cost. As to the bedrooms opening out of the living rooms, where fires were daily kept going, there must always be a considerable change in air in all the rooms. In these dwellings the birth rate for the year was 33.1 per thousand, 3.6 above the average for all London; and the death rate, including fifty-four tenants who died in hospital, 14.7 per thousand, 4.0 per thousand below the average London rate.

Mr. Fleming's Paper.

Mr. Owen Fleming, one of the assistant architects to the London County Council, followed with a paper on the re-building of the Boundary Street estate. The first buildings were designed in a plain, simple style; though not architecturally suitable for the position, they were good, comfortable buildings, and were now very popular with the tenants. By the time the second section was completed the deficit had been cleared off and surpluses were accumulating. Architecturally this second section was more satisfactory. It contained also the cheapest buildings ever built by the Council. Cleeve Buildings cost £79 per room; Sonning £68; Marlow £67; Shiplake £68. Mr. Fleming next described the plan of the estate, and gave full details of the various extra buildings and grounds for the convenience and recreation of the tenants (these particulars were given in the issue of the BUILDERS' JOURNAL for March 7th). The cost of erection was about £91 10s. per room, including all foundations, while the cost of the land worked out at about £21 16s. per room.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Book on Bowling Greens.

MANCHESTER.—ENQUIVERO writes: "Is there a book published on bowling greens, or one giving hints in laying these?"

We have never seen or heard of any work on this subject.

Book on Geometry.

WESTMINSTER, S.W.—T-SQUARE writes: "I should be glad to have some particulars of a good book on practical geometry for general use."

"Practical Plane and Solid Geometry, including Graphic Arithmetic," by Prof. H. J. Spooner, A.M.I.C.E., will probably suit your purpose. It can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C., for 2s. 8d., post free.

Liability for Repairs: Landlord or Tenant.

LETTONSTONE.—M. B. writes: "A water pipe ends in a U-bend from which the water cannot be run off, the result being a broken pipe after every hard frost. Also, the stop-cock on the supply pipe is faulty. Is the landlord or tenant responsible for repairs? Who is responsible when the following clause is inserted in an agreement for one year:—The tenant agrees to keep the premises and all glass in the windows, and all locks, fastenings, bells, and other internal fixtures in, upon, and belonging to the premises in good and sufficient repair during the tenancy, and the same in good and sufficient repair to deliver up at the end thereof (reasonable wear and tear and damage by fire excepted)."

The tenant is responsible. H. P. B.

Corporation and Old Buildings.

WISBECH.—DUBIOUS writes: "Our Corporation are proposing to widen the end of a street by purchasing and pulling down part of an old brick and tiled building (used as stables and warehouses), and adding this area to the

CORPORATION AND OLD BUILDINGS.

street. Three people, A, B, and C (see accompanying sketch), respectively, own part of this building. On the ground floor a brick wall divides A's portion from B and C, but in the loft above a roughly improvised (not weather-proof) partition of vertical boards is the only division up to the rafters, and the roof is continuous throughout the entire length of the building. If the Corporation demolish B and C's property, are they compelled to build a brick gable to A's loft next B and C? Inasmuch as the whole building has now four brick walls enclosing it, would it not follow that the Corporation must leave enclosed by four brick walls whatever portion of the building is left standing?"

We think that the Corporation are bound either to construct such walls, &c., as will after give to A's premises such support for

his roof and such protection from the weather as those premises enjoyed before the removal of the premises of B and C, or else to give to A compensation for the injury done to his premises by such removal. H. P. B.

Finding Centres of Arches, &c.

CATFORD, S.E.—W. H. G. writes: "Which is the best way to find the centres of arches, cusps, &c., in measuring Gothic monuments? Was there any formula used for striking three- or four-centred arches, or must one rely alone upon an application of the rules of geometry?"

The only thing to do is to ascertain at least three points in each curve by measurement, preferably by the use of a plumb line suspended from a known point, the centres being then determined by geometrical construction. There appear to have been no formulae used, and it is quite doubtful in many cases whether the curves were struck from centres at all. It will greatly facilitate measurement if small pieces of coloured wool are tied to the plumb line at regular distances apart. Horizontal distances (offsets) from this plumb line would be measured with a 2ft. rule or 5ft. rod. G. A. T. M.

Damp-Proofing Walls.

BELFAST.—IRISHMAN writes: "I shall be glad to know how to render walls damp-proof. The house in question is built of red brick (9in. walls) with sandstone dressings, faces the west, and is fairly well exposed; after showers of rain damp spots appear on the interior of the walls. I have heard of Szerelmey's Stone Liquid as being very effective, and I would like to have your opinion on the matter."

The conditions of a thin wall of porous material exposed to the westerly (Atlantic) wind in moist Ireland are such as to render it doubtful whether anything less than covering the external face with tile-hanging, or slates, would prove really efficacious. A rendering of cement and rough cast might suffice, though it would hardly be so sure; but the application of any such preparation as that mentioned, though it might be perfectly satisfactory under a less severe test, would probably lead to disappointment. G. A. T. M.

Drying Walls of New House.

EGREMONT, CHESHIRE.—J. G. N. writes: "Which is the best way to dry the walls of a new dwelling-house?"

There is nothing that will dry the walls of a new house so quickly as a good current of air allowed free play through it, especially during the present season of the year. In order to dry a house in the shortest possible time it should be allowed to remain uninhabited; and the drying process may be hastened if a good coke fire is made up in a "devil" or "brazier" placed in the centre of each room each evening at sunset after the windows and outer doors have been closed. Internal doors should not be closed, and registers of stoves or other ventilators should be left open. Fire by night and air by day should quickly dispel damp, provided the brickwork has not been thoroughly soaked by winter rains, in which case it may be a twelve-month before the walls are fit to be papered; but, as need scarcely be said, ample precautions must be taken to prevent the fire communicating itself to the woodwork of the house. A watchman, who would keep the fires going, would be desirable. H. C.

Advisability of Obtaining a London Experience.

SHEFFIELD.—STUDENT writes: "Do you recommend provincial students to go up to London as junior assistants after the completion of their articles for the London experience which is so much spoken of, and for the sake of attending the R.A. schools? Would they not be likely to have lost their connection or clientèle on their return to their native town, and to find setting up for themselves a failure? Would a student R.I.B.A. as assistant in a London office, and attending the R.A. schools, still have time to prepare for the final R.I.B.A. examination?"

The advisability of spending a year or so as assistant in a good London office, after completing articles in the country, is unquestionable, but the office should be one in which really good work, and plenty of it, is being done. It need not, however, be a well-known office. If any salary is given, it would probably be small, especially if the very necessary stipulation be made that no overtime is worked. Four evenings per week should be the most to be devoted to study, else the health is likely to suffer, and these would be better employed at the Architectural Association, the School of Arts and Crafts, or under some well-known tutor, than at the R.A. During the summer months, instruction can only be obtained in a few subjects, such as land surveying and outdoor sketching, but the Saturday afternoon visits to works in progress organised by the Architectural Association are always worth attending, and evenings could be devoted to the R.I.B.A. Testimonies of Study. G. A. T. M.

Right of Way.

PADSTOW.—COUNCILLOR writes: "As shown by the accompanying sketch, a public right of

way exists between the Higher and Lower Roads. This right of way is a footpath, and not of sufficient width for a cart. As will be seen, there is a limekiln and yard adjoining the Lower Road, and the owner of this has the right of bringing limestone down the right of way from the Higher Road. The stone is generally brought down in wheelbarrows and thrown over at the point A. The limekiln and yard are nearly level with the Lower Road, but several steps lead up to the point A, and this point is about 20ft. above the limeyard. Originally there was a fence from A to B (of course, for the protection of the public), but, in consequence of the material for the limekiln being brought to this point and thrown down into the yard, the base of the cliff has been undermined and a portion of it, with the fence, has fallen away; so that anyone might walk over the edge of the cliff and be injured. Whose duty is it to restore the fence—the landlord or the tenant? Also, is it the duty of the Urban District Council to see that it is done, or must the Council themselves erect the fence?"

Our correspondent does not explain who is meant by "landlord" and who is meant by "tenant," or what they are landlord and tenant of. The occupier of the limekiln has chosen for his own advantage to use a part of the way for a purpose for which it was not intended, and one which, as the event proves, was inconsistent with the preservation of the way in that condition which the safety and convenience of the public, to whom it was dedicated, required. He has by his conduct been guilty of nuisance, for which he is liable to be indicted, and in respect of which an action will lie against him at the suit of any person who may be injured by the defective and unsafe condition to which he has reduced the way. He is bound to restore the way to its former condition, replacing the soil which he has caused to subside, and the fence which he has caused to fall down. It is the duty of the urban authority to see that he does this forthwith, and, if he fails, to do it themselves. H. P. B.

Book on Thatching, Fencing, &c.

WORCESTER PARK, SURREY.—W. C. writes: "I should be glad to have particulars of a book dealing with thatching, fencing, hedging, and ordinary agricultural buildings."

"Modern Farm Buildings," by A. Dudley Clarke, F.S.I. (price 6s. net, post free); and "Estate Fences: their Choice, Construction, and Cost," by Arthur Vernon, F.S.I. (price 12s., post free). Either of these is obtainable from Mr. B. T. Batsford, 94, High Holborn, W.C.

New Streets.

HENHAM.—W. M. B. writes: "I regret I did not make my last enquiry clear enough (see page 97 of issue for March 14th). I have plans before our Council for a terrace of houses on one side of a highway. I know I can build seven or eight houses without altering the character of the road. My first question was, 'Does continuity in building on one side only constitute a new street?' or would it require some house built opposite on some part of the roadway? (2) The Clerk of this Council has stated that a lane cannot be made into a new street unless it complies with by-law 8, which requires the entrance to be the full width. I understand the Clerk to say Justice Wills' decision (see previous reply), which exactly conforms with my case, has been overruled, and he (the Clerk) advised his Council that I must widen out to where the lane commences, which would be the entrance to the new street. (3) The Tynemouth Rural authority, in by-law 8, have made it read: 'Every person who shall construct a new street shall provide at both ends of such street an entrance of a width equal to the width of such street, and open from the ground upwards, provided that where such street is less than 100ft. in length, such entrance need only be provided at one end thereof.' In view of the strong decision on one entrance, would this by-law be considered good and reasonable? I feel strongly tempted to disregard it, for in some cases it is very expensive and difficult to carry out."

(1) If buildings are erected on one side of a lane, the erection of a building on the other will make it a "new street." (*Attorney General v. Rufford* (1899) 1 Ch. D. 537). Our correspondent's proposed new houses would, therefore, convert the existing lane into a new street, and he must conform with any valid by-law relating to new streets made by the local authority. (2) Our correspondent must comply with the by-law as to the entrance, notwithstanding that the land required for the purpose of making it the necessary width does not belong to him. (*Hendon Local Board v. Pounce* (1899) 42 Ch. D. 602.) He cannot, therefore, erect houses abutting on the land until an adequate entrance has been provided. (3) It has never, as far as we are aware, been decided whether such a by-law is or is not unreasonable. In the case last quoted it was argued that a by-law requiring the entrance at one end to be of the same width as the road was unreasonable; it was held to be *intra vires* and reasonable. But the grounds of that decision hardly seem to apply to a by-law requiring the entrance to be of that width at both ends. In delivering judgment Mr. Justice North said, at page 609:—"In my opinion there is nothing unreasonable in it. It would be absurd to say that the Board were right in insisting on the road being 50ft. wide if they are not to gain the advantage that a road of that width would give. The object is, for sanitary reasons, to admit light and air, to allow the wind to sweep freely along the road. A road of that width is much more healthy than a narrow road, and, of course, the benefits of a road of that width will be only partially secured if it is closed in at each end, or at any rate at one end, by an entrance so narrow that a free draught of air through it would be impeded." One effect of such a by-law obviously would be to prevent a new street being laid out which would be a *cul de sac*."

A Monument of Garibaldi has been erected at Dijon, in Burgundy.

Views and Reviews.**MITCHELL'S BUILDING CONSTRUCTION.**

The fact that the present is the fourth edition of this book suggests that there is a constant demand for it and that it fulfils the purpose for which it was compiled. That purpose is to act as an elementary text-book for students of building instruction qualifying for examinations. Chapter I. opens with instructions to beginners in the right use of instruments and materials, with most of which we are in agreement. We do not like, however, the use of chisel points, nor the method laid down for straining paper. This should be done in such a way as to allow the sheet to be easily removed from the board, without the necessity of cutting and the subsequent washing off of the margin that remains, which soon ruins the board and is a rough, clumsy way of going to work. If a paste or mouth glue is used, and a margin of not more than a quarter of an inch, a thin knife blade can be inserted under the edges of the paper, which will bring it up intact and leave hardly a mark on the board. The list of conventional colours laid down for use is purely arbitrary, and must result in a most inharmonious and crude effect. While, of course, some recognised system must be pursued, at any rate in a school, it would be a good thing to encourage students, within certain limits, to mix harmonious colours, and it might have been pointed out that in every-day practice no such hard and fast rules obtain and that many of these colours are never or rarely used.

After this introductory chapter, the author proceeds to point out the most modern and approved methods of construction in brickwork, masonry, iron, wood, &c. Everything is most carefully drawn out, with figured dimensions and scantlings, and the book seems most complete.

While we have nothing but approval for this work which, within its limits, is good as far as it goes; yet what we feel about such books as this is that they do not force the student to think for himself, which, as we have often insisted, is the end and aim of education. As an example of what we mean take, say, the first chapter on brickwork. There it is laid down as a law that the bottom course of footings to a brick wall should be twice the width of the wall. Of course, this is the usual custom, even a regulation of the Building Act, but it is not an infallible law. The footings to a wall should be in relation to various varying circumstances, to the amount of weight a wall has to carry, to the nature of the foundation on which they are placed, etc. A wall may start from its footings with a width of 18in., it may be a retaining wall but few feet in height and carrying no weight at all, or it may go to a considerable height and carry several floors for heavy goods, and be subject to much vibration and wind pressure, &c. Why should the footings be the same in both cases? Under the same heading we are also told that the concrete under footings usually from 2ft. to 7ft. in depth, and 12in. wider than the base of footings. These sort of statements, true enough as far as they go, need qualifying, if the student is to grasp the principle of the thing. He ought to be told that concrete varies in width according to the nature of the soil and the load which it carries; that it is taken to whatever depth is necessary to find a firm foundation for it. It has been the present writer's experience to make it from 1ft. to 18ft. in depth, and from 1ft. to 6ft. wider than the width of footings. We are distinctly of opinion that this method is not the right way to begin the elementary study of construction. We think that the reasoning powers of the student should be appealed to from the very first; that he should be told the reason why footings or concrete are used at all; what the object is in spreading them out and making as many bricks as possible headers; why concrete needs to be wider than the lowest course of footings; in fact, the reason for everything. The few broad guiding principles

should be laid down and explained, and the student should be encouraged to apply them, in his own way, to every problem that comes to hand. If this were done, there would be no harm in giving the particular method which is most customary in ordinary circumstances; it would then take its proper position simply as a piece of useful knowledge; but, stated like this, with no qualifying explanation, and no appeal to the principle or reason, it assumes too much importance, and the student is apt to treat it with an exaggerated respect, as if it were a moral law and not merely a convention.

We do not wish to be understood as condemning this book. As we have already said, we approve it as far as it goes. It is evidently compiled to serve a certain purpose, and it is not fair to quarrel with altogether because it does not serve some other purpose. Our quarrel is with the system, for the service of which this book is prepared, which we think is calculated to turn out any number of rule-of-thumb constructors. We look upon construction as an art, and while so many hundreds of students are taught in this fashion in our technical schools and other institutions, we think it is no wonder that daring and original constructors are so few.

A. R. J.

"Building Construction and Drawing." (First stage. Fourth edition). By Charles F. Mitchell. London: B. T. Batsford, 94, High Holborn.

Masters and Men.

The Montrose Masons have been granted an increase in wages from 7d. to 7½d. per hour.

The Harrogate Joiners have struck for a ½d. increase on their present wage of 8½d. per hour.

The Bridlington Joiners have struck for an increase in wages from 7½d. to 8½d. per hour, with a reduction of hours.

The Blackpool Joiners have been granted an increase of ½d. per hour on their previous wages of 10d. The masters also agree to provide for the men's tools being locked up.

A Strike of Plumbers employed at the New Isolation Hospital being erected at Leicester has occurred, the men contending that work they should have had is being carried out by engineers.

The Cheshire Building Trade.—The joiners in the Cheshire building trade have received an advance of ½d. per hour, making 8d. The bricksetters have requested 1d. advance in May on their present wage of 8½d. per hour.

The Proposed Labour Conciliation Board in the Building Trade.—The suggestions for the formation of a Board of Conciliation for the Building Trades have, so far, proved inoperative. The matter has been under consideration by a special conference of representatives of the several trade unions in these trades held at Nottingham, and after discussion they passed the following resolution: "That this meeting of representatives of the house building trades are sorry that the National Association of Master Builders have not seen their way clear to help the trades to bring about the formation of a National Board of Conciliation. As responsible representatives of the workmen we have advocated the formation of this Board to promote industrial peace, and sincerely regret that the National Association of Master Builders, by the conditions they seek to impose and by their inaction, have declined to effectively support the movement; but if at any time the Association desire to re-open the matter we shall be pleased to co-operate with them."

Kelby College, Tavistock, has had a new wing added to it at a cost of about £10,000.

The Association of Municipal Corporations held its annual meeting and dinner on Saturday last.

The Birmingham Royal Society of Artists opened their thirty-fifth spring exhibition on Monday last.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"A man needs knowledge—not only as a means of livelihood, but as a means of life."—
G. J. GOSCHEN.

Our Inset Sheets.

THE designs by Mr. William Emerson, F.R.I.B.A., are dealt with in our "Men who Build" article on page 143 of the present issue. The assessor in the Clacton-on-Sea competition for the proposed winter gardens at West Cliff was Mr. J. Oldrid Scott, F.R.I.B.A., who placed the designs by "Go Forward" (Messrs. Brown and Burgess, of Ipswich) first, those by "Ad Rem" (Mr. T. H. Baker, architect, of Colchester and Clacton-on-Sea) second, and those by "Rational" third. The cubic contents of the building shown in the first premiated design is about 428,080ft., exclusive of two detached structures to the east and west of the main building. They consist of rather elaborate staircases down the cliff, the one having a suite of shops and the other baths for ladies and gentlemen. The plan shows a fine range of promenades and winter gardens, occupying the centre, with a symmetrical block on each side, one being a concert hall 74ft. by 42ft. and the other containing a double billiard room 48ft. by 20ft., refreshment and club room 42ft. by 28ft., with store and apparatus room on the ground floor and a reading room and dining room above, respectively 48ft. by 20ft. and 42ft. by 28ft., with kitchen accommodation. The central block on the ground floor consists of a large entrance hall with the principal staircase, with a large apartment on each side called entrance lobbies to the concert room and club room, but forming with the entrance hall a very fine promenade 102ft. long. A central cupola is suggested, and would have a good effect architecturally. There are four entrances.—The second premiated design is reported by Mr. J. Oldrid Scott to be equal in architectural merit to the first design. The central concert hall he describes as excellent, but criticises the sufficiency of the lighting of the baths, and also the cost of the building, which, undoubtedly, would be larger than that of the first premiated design. The great advantages of this (the second) design are the extensive promenades and winter gardens overlooking the sea; these are not equalled or approached in any of the other designs. The construction of the back walls is very strong, all the walls being of deep segmental shape, with the cross walls acting as buttresses. If this design were somewhat reduced in size, and the baths converted into a restaurant or an annex to a palm-house, many who have carefully studied the drawings consider it would be the best, and Mr. Scott's report bears out this opinion. Mr. Scott makes the following estimate for the erection of the buildings:—"Go Forward," £17,850; "Ad Rem," £23,550; "Rational," £19,200.

The Royal Academy.

It is expected that the Academy collection will this year be a good one. Professor Aitchison, Professor Herkomer, Mr. Briton Riviere, Mr. Seymour Lucas, Mr. Brock, Mr. Peter Graham, Mr. Abbey, Mr. Gow, and Mr. Gregory will, with Sir Edward Poynter, sit in judgment on the works sent up; and the hanging will be done by Mr. Abbey, Mr. Gregory, Mr. Graham, Mr. Gow and Mr. Brock, with one other Academician not yet selected. The council is reasonably representative, though it is certainly weak in landscape painters, and as a result of its deliberations the exhibition should be somewhat wider in scope than it has been of late; and it may be expected to show some sympathy with the efforts of the younger men.

The Sirdar's Palace.

THE building of the Sirdar's Palace at Khartoum is now being rapidly completed, and, by a great piece of luck, will have furniture of a most sumptuous character. It will be remembered that when the German Emperor and Empress paid their historic visit to the

East, they were expected to include Egypt in their tour. The Khedive accordingly gave orders to certain firms in London and Paris for the supply of furniture on a lavish and magnificent scale for the apartments which their Imperial Majesties would have occupied in the Khedivial Palace. The consignments were duly delivered, but when a change in the plans was made, and the Royal party came not, the beautiful and costly furniture became superfluous, and it has now been handed over to the Sirdar for the adornment of his palace in the Soudan.

German Art.

PROFESSOR HERKOMER has addressed a letter to the German papers denying the rumour circulated in French journals that all German works of art have been excluded from an Exhibition of International Art in London. He states that no such exhibition is to be held in London this year, and that he has received a letter from Sir Edward Poynter in which he says that the Royal Academy "would never think of entertaining such a childish and despicable intention, least of all towards a nation with which, as I am positively convinced, we are on the best of terms." Professor Herkomer also says: "The whole matter may probably be explained thus: That an attempt has been made by a certain irresponsible portion of the French Press to sow discord between England and Germany. This attempt has, of course, failed. These two nations are closely connected by blood, temperament and aims. They were pioneers, side by side, in the advancement of civilisation and culture; and in the future they must remain the chief forces in this direction. May no newspaper agitation, inspired by self-interest, try to sow discord, thus causing the fact to be forgotten that the English nation, and especially the artistic portion thereof, has always entertained, and will ever entertain, feelings of the warmest friendship and highest esteem towards Germany."

A Prize Distribution.

WHEN distributing the prizes to the successful students at the Sheffield School of Art on Friday last the Lord Mayor (Mr. Samuel Roberts) said that they did not want design in the abstract, but in the concrete, like the city mace, which was made by the agency of the school. Professor Ruskin had said that "all art worthy of the name was the energy, neither of the human body alone, nor of the human soul alone, but of both united, one embodying the other, good craftsmanship and work of the fingers joined with good emotion." There they had it in a nutshell—they must have craftsmanship. There was no doubt that Birmingham was a great competitor with Sheffield in many of the decorative trades. He did not think that at present Sheffield could spend £9,000 a year as Birmingham did; at the same time it was well that they should remember what was being done elsewhere. He would like to put the question: What is a School of Art? He defined it as a school of good taste. What was good taste? His answer would be: It is to imitate the purest forms of Nature and the products of Nature. It had been well said by an old Latin writer that "All art is the imitation of Nature," and let them depend upon it that the closer they kept to Nature the purer their art would be. They were all influenced by their surroundings, and they wanted to train the rising generation to have a more refined taste. If they did that, they more or less influenced character. Refinement of taste was the refinement of character.

Cardiff's New By-laws.

WITH regard to the new street and building by-laws which Cardiff has now obtained after a tussle of twenty years with the Local Government Board, the "South Wales Daily News" says:—A comparison between the old by-laws and those that have now come into force is instructive. In bulk alone there is a great difference, for in 1859 thirty-four by-laws were deemed sufficient for street and building regulations; in the new series there are 114 by-laws. The principal feature

of the new by-laws is the greater stringency observed all through, the closer attention to detail, and the setting beyond all doubt that which was previously obscure. Every road laid out must be at least 40ft. wide, and in street more than 300yds. long the width must be 50ft. The footings of every wall in a new building must now rest on solid ground, or upon a sufficient thickness of good concrete, or upon solid and sufficient substructure. In the case of a building to be used wholly or in part as a dwelling-house, if the site is not at least 2ft. above the ordnance datum (practically the sea level), the space between the walls of the building must be filled with suitable material. Upon this filling, as upon the ground surface of every domestic building, there must be placed a layer of concrete or other specific covering 6in. thick. This does not apply where the site, if cleared, lays bare a surface of solid rock, but as there is little solid rock at Cardiff it will have to be done almost invariably. One more important provision is the requiring a proper damp-course in all walls—a building beneath the level of the lower timbers and 6in. above the ground. Further clauses deal with provision of open spaces at the rear of buildings to ensure a free circulation of air, and other clauses again vest in the authorities more extensive jurisdiction as regards the thickness of walls, the character of the work put in the building, and so on. Increased powers, and in many instances new powers, are given the Corporation in regard to fireproof stairways, etc., in public buildings paving yards of dwelling-houses, house drains and other sanitary matters.

The Value of old Work.

MR. ANDREW MUIR moved at last week's meeting of the Edinburgh Architectural Society, "That this meeting is of opinion that in the education of architects office work can best be supplemented by the preparation of measured drawings of old work." Mr. P. Nobbs moved an amendment, "That if architectural student could best supplement his office work by dividing his time between working at students' design competitions and the careful use of the architectural sketch book." Mr. Muir said he considered that the practice of merely making sketches and jottings when studying old work was most objectionable and useless. The method gave no idea of proportion. The standard reference books on architecture would be worthless if the authors had merely sketched and not carefully measured the work. Copying was quite legitimate. The careful drawing required for measurement helped draughtsmanship. Mr. Nobbs, in opposing the motion, said that the usual routine of office work taught construction, planning and modern requirements. Proportion could only be studied outside of hours. In the office the student had as much practice in drawing as was necessary. The aims and spirit of the old masters could not be gathered by mechanically measuring old work. The various measured drawings produced, even our best draughtsmen often gave a total different character to the same piece of work. The books of reference were simple catalogues of mouldings placed one after the other, with sometimes no key as to what height or position they occupied in the building. Moreover, the men who compiled the books were seldom prominent architects, as a result of all their study they were unable to design. Mr. Wm. Davidson considered that the student gained by merely sketching a confused recollection of the old work, which was no practical use. A large amount of old work could be gone through in a short time by the sketch book method, but the knowledge gained would be forgotten in as short a time as that in which it was acquired. Mr. Davidson also thought that architects should give the draughtsmen more time to visit the buildings and see their designs when carried out. Mr. Balfour Paul supported Mr. Nobbs, stating that by measuring old work the student learned draughtsmanship but gained no knowledge of architecture. There was art in the old work itself but not in the repetition of it. The meeting decided in favour of Mr. Muir's view.

Keystones.

The Aberdeen Society of Architects recently held its annual dinner, when the president, Mr. Arthur Clyne, occupied the chair.

The Official Opening of the Paris Exhibition has now been definitely fixed for April 14th.

A General Trades Exhibition at Brixton Hall has been opened, and will remain open until April 7th.

A new Fire Station at Bradford is proposed to be erected in Nelson Street at a cost of more than £9,200.

The Grand Theatre, Islington, which was recently gutted by fire, is to be rebuilt. No important change is proposed.

A New Organ at All Hallows Church, Kendal, has been erected at a cost of £65 by Messrs. Wilkinson and Son, of Kendal.

St. Matthew's Church, Nottingham, has been redecorated by Messrs. Gascoigne and Sons, of Nottingham, at a cost of about £100.

Manchester Ruskin Society.—It has been decided to revive the lapsed Ruskin Society which bore the title of "The Society of the Rose."

"Architectural Review" Competition.—The closing day for this competition (for a villa on the Riviera) has been extended from May 31st to June 30th next.

A New Board School at Seacombe has been built by Mr. Edmund Gabbutt, of Liverpool, from designs by Messrs. T. Mellard Reade and Son, architects, of Liverpool.

A New Chancel Screen at St. Peter's Church, Morley, has been erected. It was designed by Mr. Harrison Morton, A.R.I.B.A., and executed by Messrs. Harry Hems and Sons, of Exeter.

An Addition to the Victoria Embankment.—A block of offices has been erected for the Metropolitan Asylums Board between the Temple and Blackfriars Bridge. The frontage is about 90ft.

The Hanley Town Council has decided to apply to the Local Government Board for sanction to borrow £9,500 required for the provision at Sandyfield of a refuse destructor, and approaches.

An Old Church in Need of Restoration.—The church at Llanddew, near Brecon, one of the oldest in Wales, needs to have its nave restored. This work will cost about £400, of which £350 has been collected.

Architects and By-Laws.—A deputation of Hull architects, consisting of Mr. F. S. Brodrick, Mr. B. S. Jacobs and Mr. J. Bilson, waited on the Hull Corporation Water and Gas Company last week to submit certain objections to the new city by-laws. They urged that 12lbs. instead of 15lbs. per yard should be the required weight of 1in. waterpipes, and that the maximum flush for water closets should be increased from two to three gallons. The chairman (Alderman Massey) promised the deputation that their views would be carefully considered, but reminded them that the by-laws had received the sanction of the Local Government Board and that all the water used in the city had to be repumped as sewage.

Institute W. Schimmelpfeng.—The report of this Institute for the past year contains various items that are of general interest to commercial men, and some instructive instances are given of "evils in mercantile reporting which are the cause of so many losses daily to the business community." The Institute's progress can be readily gauged from the fact that the staff now exceeds 900, whilst the annual expenditure has increased to close upon £150,000. In regard to reporting on firms in the United Kingdom, some interesting remarks are made on the incorrectness of asking mercantile agencies to fix a specific limit of credit; also on the introduction of the American system of "personal statements," and the improvements in reporting on limited companies which will result from the proposed changes in the Companies' Law.

The Late Mr. Charles Henry Purday, A.R.I.B.A., whose death occurred on March 23rd, was in his seventieth year.

Glasgow Exhibition, 1901.—All applications for space must be made not later than June 1st next to the general manager, Mr. H. A. Hedley.

Bournbrook Technical Institute, Selly Oak, was opened last week. The building cost £2,500, the lighting and heating installations about £350, and the land £700.

The Death of Mr. Edward J. Lowther, F.R.I.B.A., a member of the firm of Messrs. Gordon, Lowther, and Gunton, occurred on March 23rd at Withrington, Sutton, Surrey.

Artistic Copyright.—Lord Monkswell's Artistic Copyright Bill, which we dealt with last week, was read a second time on Thursday last and referred to a select committee.

New Lancashire Churches.—A new church and rectory is to be built in the Ladybarn district of Fallowfield, near Manchester, and a site has been given by the Earl of Derby for St. Alban's Rectory, Cheefwood.

A New Theatre at Walsall, called "Her Majesty's," has been built at the top of Park Street from designs by Messrs. Owen and Ward, of Birmingham. Seating accommodation is provided for about 2,000 persons.

Art Exhibition at St. Helens.—The Corporation of St. Helens have decided to hold an art exhibition in the Public Museum, Victoria Park, from May 3rd next until August 11th. The exhibition is to comprise drawings and paintings, and a section will be devoted to a display of examples of decorative arts and crafts. The receiving days are fixed for April 5th to 7th.

Royal Scottish Society of Painters in Water-Colours.—This Society, which is the only body of artists in Scotland devoted to the encouragement of water-colour painting, has this year taken a new departure by acquiring a permanent home in Glasgow. The new galleries are at 153, Sauchiehall Street and comprise two handsome rooms that will hold from 300 to 400 pictures.

New Baptist Schools at Old Basford, Nottingham, have been erected at a cost of about £3,720 by Mr. W. J. Hutchinson from designs by Mr. W. V. Betts. The new building consists of a central hall, 63ft. 6in. by 47ft., with a gallery on two sides and at one end, capable of seating 1,000 persons. The hall is surrounded by seventeen classrooms, providing sitting accommodation for 500 scholars. The old schools have been retained and will be connected with the new building by two passages, one on each floor. The whole block is heated with hot water on the low-pressure system.

Workmen's Trains.—In a Bill promoted by the London, Brighton, and South Coast Railway Company, before a Select Committee of the House of Lords on March 21st the London County Council asked for the insertion of the following clause: "The company shall at all times, before 8 a.m., run a sufficient number of trains in both directions to and from all the stations of the company within twenty miles of the terminal station in London for the conveyance of working men and women." After brief deliberation in private by the Committee, Lord Elgin (chairman) announced that they were not prepared to accept the clause of the County Council.

Newcastle Society of Antiquaries.—At the meeting of this society held on Wednesday last Mr. Cadwallader J. Bates referred to the doubt in which they were left as to the actual position of Prætorium from York, and discussed the theories that were held as to its site. The first theory was that Prætorium was at Filey or Bridlington. The prevalent theory was that it was at Brough on the Humber. The sensible theory was that it was at or near Whitby. He expressed the hope that the Society of the East Riding of Yorkshire and others would, by the excavations which they had begun, lead to a successful conclusion.

Under Discussion.

Ancient Buildings and Natural Beauty.

At a meeting of the Liverpool Ruskin Society held last week Mr. W. T. Haydon lectured on "The National Trust and the Preservation of National Monuments." There were, he said, numberless old ruins scattered over the earth which, instead of being preserved and cared for, were gradually decaying, owing to the effects of the elements in some cases, in others to the hand of the wilful destroyer. The restorer was also sometimes to be dreaded. It was not until the middle of the present century that the various archaeological societies, together with the Camden and afterwards the Ecclesiological Society, sought to remedy the state into which ecclesiastical buildings had fallen. But their work of restoration was undertaken with inadequate knowledge, the result being that they succeeded during 1840-1872 in utterly defacing 7,144 cathedrals and parish churches, at a cost of £25,000,000. Where alterations were necessary, they should appear to be what they were in reality—modern alterations, and not a slavish imitation of other parts of the same building. One of the most potent factors in directing interest into the right channel was the publication, in 1849, of Ruskin's "Seven Lamps of Architecture." In 1877 William Morris assisted in the formation of "The Society for the Protection of Ancient Buildings." That society had done much good work in the restoration of ancient buildings, and to its influence was due the first Act of Parliament dealing with such matters. This Act, which did not go far enough, was followed by another in 1892. Two years later was formed the association known as "The National Trust for Places of Interest and Natural Beauty." It had been active in opposing schemes and proposals likely to be injurious to such places, many of which it had taken in hand. He hoped the members of that Society would be induced to assist the Trust as far as their power allowed.

Irish Sculpture.

At the recent monthly meeting of the Belfast Art Society Mr. S. Shannon Millin, barrister-at-law, lectured on "Irish Sculpture." In all that remained of ancient Irish art there was evidence of an excellence of workmanship, the result of a refined taste and patient perseverance. Long before the Christian era the Irish displayed great skill in the working of precious metals, while in the Book of Kells they had "the most elaborately executed monument of early Christian art in existence." Art, which had flourished from a time long anterior to Christ, ceased about 1460 A.D., and for a period of three centuries it seemed that the spirit of the artistic genius had vanished from the country. But there was yet in store a brighter era for Ireland, when the native talents were once more to be aroused from their state of lethargy to the production of works of art which, for originality of thought and variety of execution, had become the subject of universal admiration. After referring to Smyth, Kirk, and other eminent artists, Mr. Millin said that Ireland had produced three great sculptors during the nineteenth century, whose names were enshrouded among the illustrious in art. M'Dowell, Hogan, and Foley raised themselves to the loftiest eminence by their untiring industry and intense mental application. Hogan said, "Labour is the only price of solid fame; whatever a man's force of genius may be, there is no easy way of becoming a great artist." After describing the principal works, the lecturer proceeded to mention how Cork, Dublin, and Belfast had recognised the genius of their worthy sons. Cork had always patronised art, and when Hogan first visited his native land, after his departure to Rome, Cork gave him a public reception and awarded him a gold medal as a recognition of his genius. After his death, every work that could be easily obtained was deposited in the Crawford School of Art, where the youthful students might with advantage emulate his

example, and thus uphold the artistic traditions of which they had reason to be proud. Dublin patronised Foley by giving him numerous commissions, and the streets of his native city were rich with his choicest works. Belfast regarded with apparent apathy the fact that M'Dowell belonged to her by birth. The one statue for which he received a commission to be erected in his native city was dragged from its position to make way for another by a different artist, until it had at length found a place in the Free Library.

Engineering Notes.

For Electric Lighting in Dublin, £254,000 are proposed to be spent.

For Electric Light Extensions at Newcastle, £10,000 are proposed to be spent.

Mr. Rogers Field, the eminent sanitary engineer, died recently at his residence at Hampstead.

The Death is Announced of M. Samson Jordan, the distinguished French engineer and metallurgist.

Bradford Street Lighting.—It has been decided to provide incandescent gas burners to all the ordinary street lamps of Bradford.

Liverpool Electric Tramways.—A scheme which has for its objects the taking over by a private concern of the Corporation electric tramway system has been formulated and laid before the Tramways Committee.

The Extensions to the Nuneaton Cottage Hospital are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Bristol Association of Engineers held its annual general meeting on March 29th. After the transaction of business, Mr. A. P. I. Cotterell, A.M.I.C.E., read a paper on "The Engineering Aspect of Sewage Purification."

Electric Lighting at Rotherham.—On March 20th a Local Government Board enquiry was held into the application of the Rotherham Corporation for sanction to borrow £27,969 for electric lighting on the three-wire system.

Wesleyan Schools, Weston, have been fitted with the latest improved "small tube" hot-water heating apparatus by Messrs. John King, Limited, engineers, Liverpool, who employed their well-known special economical coil heater.

Harrogate Borough Engineership.—The position of borough engineer under the Harrogate Corporation, rendered vacant by the resignation of Mr. S. Stead (late of Bradford), has been offered to Mr. F. Bagshaw, assistant surveyor.

New Waterworks at Todmorden are to be constructed by Mr. Benjamin Lumb, contractor, Todmorden. The new reservoir will be 84ft. deep, with a storage capacity of 120,000,000 gallons. The work is to be completed in four years and a half.

Bristol Improvement Schemes.—The Bristol Corporation propose to spend £145,150 for electric lighting extension, £5,215 for street improvement, and £10,850 for the extension of the museum in Queen's Road and the erection of an art gallery. A Local Government Board enquiry has been held.

Proposed New Gasholder for Llandudno.—A Local Government Board enquiry was held last week into the application of the Llandudno Urban District Council for sanction to borrow £12,104 for the provision of an additional gasholder and gas manager's house at the gasworks.

The late Mr. F. W. Stevens, C.I.E., the celebrated civil engineer who recently died at his residence in Bombay, designed many of the most important public buildings in that city, and was a magistrate for Bombay, a member of the Society of Arts, an Associate Member of the Institute of Civil Engineers, and a Fellow of the Royal Institute of British Architects.

NEW INFIRMARY, HENDON.

ON Thursday afternoon last the new infirmary which has been erected at Hendon for the Central London Sick Asylum District was opened by Thomas Prescott, Esq., M.R.C.S., L.R.C.P. (London), chairman of the Board of Managers. The guests were received at the Nurses' Home, and from there started in procession (headed by the band of the Strand Union Schools) for the central building, in the hall of which a memorial tablet was unveiled and the infirmary formally opened. (We give an illustration of this central building on one of our inset sheets this week.) After an excellent luncheon, the visitors inspected the new buildings. The toasts at the luncheon were as follows:—"The Queen" (by the chairman, Mr. Prescott), "The New Asylum" (by the chairman, responded to by Dr. Hopkins, medical superintendent), "The Chairman of the Board" (by Mr. W. J. Fraser), "The Boards of Guardians in the District" (by Mr. F. H. Bingham), "The Vice-chairman of the Board and the Managers" (by Mr. R. Hovenden, responded to by Mr. F. H. Bingham and Mr. Forbes-Robertson), "The Architects and Builders" (by Mr. A. Deed), and "The Visitors" (by the chairman). The Central London Sick Asylum District embraces the Strand Union, the Westminster Union, and the parishes of St. Giles and St. George, Bloomsbury, and was formed in 1868 for the purpose of providing an asylum in which proper accommodation, nursing, and attention should be provided for the sick poor chargeable to those unions and parishes. It was found that the required enlargement of the Cleveland Street Asylum would entail an expenditure of £200,000 for land alone, which was impracticable; so, after visiting many sites, the one at Hendon, comprising 27½ acres, was purchased with the approval of the Local Government Board. This site is elevated and salubrious, and is situated about a mile to the north-west of Hendon Station and a short distance east of the Edgware Road. Designs were invited from six London architects, and those of Messrs. Giles, Gough and Trollope were accepted. The approach from the Edgware Road to the infirmary is by a new road and bridge over the Silk Stream, and from the porter's lodge the drive leads to the main entrance on the south, while a branch drive on the east leads to the stores entrance, the laundry, the engine and boiler room, and the mortuary on the north. To the right and left of the main block are the medical superintendent's house and the nurses' home. The administrative block contains board room and clerks' office on the west, and patients' receiving room and offices for the chaplain, medical officers and dispensers on the east. Behind this block, and separated from it by a corridor giving access to the different ward pavilions, is the kitchen, with mess rooms for nurses and servants adjoining; while on the east and west are store departments. To the rear of this again, and connected by a covered way, is the laundry, the engine and boiler house, the carpenter's shop, and the firewood stores. Still farther north is the mortuary, to the east of which is the steward's house. On the east and west sides of the administrative block, which occupies the centre of the site, is a ward pavilion two storeys high, and in a line with these are smaller wards one storey high and a specially-planned operating room. On each floor of the larger pavilion ward accommodation is provided for twenty-eight patients, and for two more in a small ward attached—that is, each pavilion provides sixty beds, or 240 beds altogether. The one-storey wards provide thirty-four more beds—a total of 274. Should additional accommodation be necessary, space is provided for erecting two more pavilions, which would bring up the total to 400 beds. The buildings are erected of stock bricks with red brick facings, relieved by Suffolk brick bands and strings and Portland cement dressings. The roofs are covered with green slates. The main corridors are lined to dado height with glazed bricks; mosaic pavement is used for the floors, and granolithic for the stairs and landings;

the wards are plastered with Keen's cement dado; and all the joiner's work is of pitch pine, with floors of the same material wax polished. In the construction of the buildings more than five million bricks, 3,000 tons of mortar, 7,000 tons of concrete, and between four and five miles of pipes have been used, while about 25,000 tons of soil were excavated for foundations and basements. Heating is by hot water on the low-pressure system. The site cost £12,428, and the buildings £115,000, making the total cost £127,428. The following were the contractors:—Heating, kitchen and laundry apparatus, Messrs. J. and F. May, engineers, Whetstone Park and Holborn; electric lighting (three-wire system), Messrs. Hampton and Sons, Limited, Pall Mall, S.W.; Messrs. Lucas and Pyke acting as consulting engineers; lifts, Messrs. Clark, Bunnett and Co., Limited; window blinds, Fullers Manufacturing Co., Limited, London Bridge; beds, Messrs. Cartwright and Sons, Lambeth; furnishings, Messrs. Hampton and Sons. The main contractors were Messrs. H. Willcock and Co., of Wolverhampton.

Trade and Craft.

Lighting by Acetylene Gas.

The fact is being realised that the artificial lighting of rural and isolated places has entered upon a new era. One has only to drive, after dark, through the well-lighted streets of, say, St. Michael's Village, near Tenterden, Kent, or Hillesley, near Wotton-under-Edge, Gloucester, to appreciate at its proper value the new gas—acetylene. Architects and builders must sooner or later—and better sooner than latter—give this subject the attention it deserves. When it becomes widely known that for an outlay for plant not exceeding twenty guineas gas can be supplied for a whole house of twenty rooms, or for a church holding 500 people, the demand for this light, in lieu of oil lamps, will be general. Nor should it be forgotten that the illumina-

"INCANTO" ACETYLENE GAS APPARATUS.

ting power of this gas as compared with coal gas is, without the aid of a mantle, as fifteen to one. No surprise need be expressed that in the early stages acetylene has had to fight its way (just like coal gas and electric light before it) against imaginary conceptions of danger, induced chiefly, as in the former cases, through accidents arising from inexperience, rashness, or crass stupidity. It has, however, been the duty of those engaged in the industry to produce such apparatus that even stupidity and negligence become harmless, and such is the result claimed for the "Incanto" system (illustrated on this page)

of Messrs Thorn and Hoddle, of Westminster, who have supplied the plant for the villages referred to, and for churches, schools, and mansions throughout the country. It is probable that before very long it will be difficult to find a country house where the old method of lighting by oil has not been abolished.

Builders' Notes.

The death is announced of Mr. Morris Morris, a well-known Liverpool builder.

For laying faulty drains in a house in Oulton Street, S.W., a builder named W. Bell was fined £15 and costs on Thursday last.

For Additions to the Coventry City Hospital the tender of Mr. R. W. Hughes, of Birmingham, amounting to £9,372 3s. 8d., has been accepted.

Water-closet Question in Hull.—The Hull Corporation's proposal to compel owners of 17,000 houses in the city to forthwith substitute water-closets for ash-closets is causing a good deal of local excitement—even irritation.

Cartwright Memorial Hall, Bradford.—The work of erecting the Cartwright Memorial Hall in Bradford will now be proceeded with. Contracts were let last week for £51,488. Including architect's commission, &c., the total cost will be £55,000. The excess over the £40,000 will be borne equally by Lord Masham and the Bradford Corporation.

New Thames Tunnel.—A Select Committee of the House of Lords sat on Thursday last to consider the Bill promoted by the London County Council for the construction of a tunnel under the Thames at Rotherhithe. This tunnel would be two miles from the Tower Bridge and would cost £2,200,000. After hearing several gentlemen give evidence the Committee adjourned.

The Norwich Master Builders held their annual dinner on Wednesday last, the chair being occupied by Mr. G. G. Hawes, the president, who said that the Association had been established for three years. He would like to see a good arbitration clause in all contracts, for he did not think one man should have full control of a job. The builders felt that they should be united, not for aggression or for the oppression of the men, but for defence only. Moreover, by means of the Association petty jealousies were removed, for they met and consulted together as friends. During the last year the Association had been allowed to formulate a book of day work prices, which would establish a uniform rate for the whole city.

Metropolitan Asylums Board.—At last week's meeting of this Board it was decided to accept, subject to the approval of the Local Government Board, the tender of Messrs. Leslie and Co., Kensington Square, W., of £222,459, for the erection of the Joyce Green Hospital. This hospital is designed to accommodate 940 patients in twenty-two pavilions of forty beds each, with isolation accommodation for sixty patients. The work now proposed to be carried out provides for the erection of ten of these pavilions and of isolation accommodation for thirty-six patients, together with the erection of the whole of the administrative accommodation and of a small ambulance station. It also provides for the construction of the foundations of the remaining twelve pavilions and of the remaining isolation blocks. The tender of Mr. J. Green (Stockport) of £714 7s. 8d. for the supply of cupboards and other fittings to complete the equipment of the Grove Hospital was accepted.

London County Council.—At last week's meeting of the Council it was decided that the General Purposes Committee should convene a meeting of the representatives of the

City Corporation and the vestries and district boards for the purpose of considering several matters relating to streets and street traffic. The following matters are included:—The best method of removing house refuse, the best kind of portable receptacle for use by householders, and the best contrived vehicle for the conveyance of house refuse through the streets so as to avoid nuisance. The best method of cleansing and sprinkling the roads. The best method of indicating the names of thoroughfares, not only at the ends, but at the intersections of streets. To suggest better regulations for the further suppression of street cries, railway whistles, and other objectionable and unnecessary noises. To suggest better police regulations for the protection of the public while building operations contiguous to foot pavements are being carried on.—After considerable discussion, it was decided to contribute £11,750 towards the cost of widening West Hill, Wandsworth, to 54ft., providing the District Board agreed not to oppose the Council's scheme for the construction of a light railway or tramway from Clapham to Putney.—An estimate of £14,000 was passed for the reconstruction of the swing bridge over the London Dock cut at Old Gravel Lane.—The Council formally agreed to purchase a short length of tramway between St. George's Circus and Waterloo Road at a cost of £6,000. This will give the Council the ownership of the whole of the South London Tramway Company's system.

More Fire Tests.—The British Fire Prevention Committee sends us Nos. 38 and 40 of their publications. The former deals with a fire test with a floor made by the "Gypsin" Brick Co., Ltd., of London and Paris. The superficial area was 35ft. (10ft. by 3ft. 6in.), a month was allowed for construction and drying, and the weight distributed over the whole surface was 168lbs per square foot. The effect of the test was as follows:—In twenty-seven minutes small flakes dropped off the soffit in places, and the upper surface was quite cool to the touch. In thirty-four minutes further small flakes dropped from the soffit and a longitudinal crack, about 5ft. long, appeared. In fifty-nine minutes, when the gas was shut off, the soffit appeared red-hot, and vapour was observed to be issuing through cracks in the upper surface, and from the stack of bricks forming the load. After the test, and after the load had been removed, cracks surrounding the floor were observed, as well as the longitudinal crack already mentioned. The cracks were fairly open in places to the extent of about $\frac{1}{2}$ in., and they went obliquely through the floor and appeared as hair cracks of the soffit. The floor towards one end had sunk in the centre about $\frac{1}{4}$ in. Several transverse cracks were also observed and the material of which the floor was composed crumbled away at the touch when broken for examination. Publication No. 40 deals with a fire test with two framed doors, one of 2in. Austrian oak, with 2in. solid panels, and the other of 2in. American walnut, also with 2in. solid panels. This was the result:—In fifteen minutes flame appeared at intervals over the top rail, west side, of the walnut door. In thirty-three minutes flame appeared through the top of the east top panel (between rail and panel) of the oak door. In thirty-six minutes flame appeared between top west panel and top rail of walnut door. In forty-two minutes flame appeared through the joint between the top muntin and the top east panel of the walnut door. In forty-five minutes the lower west panel of the oak door fell out. In fifty-one minutes the upper panels and muntin and top rail of the oak door fell out. In fifty-five minutes the remainder of this door collapsed. In fifty-eight minutes the walnut door collapsed. On Wednesday afternoon last the Committee tested a floor of wood joists, with a concrete filling and a plaster ceiling on expanded metal lathing, the concrete protecting the joists from below. Another test was with two wood doors of special make. These tests had particular bearing on questions dealt with in the Building Act but subject to much controversy as far as technical opinion is concerned. The next testing day for tests under this series is Wednesday, April 11th.

Surveying and Sanitary Notes.

Beach Improvement at Yarmouth.—The Corporation of Yarmouth propose to extend the Beach Promenade at a cost of £3,000, and to spend £2,800 on wood-paving.

Cookridge Street, Leeds.—A special meeting of the Leeds Improvements Committee was held on March 29th, when it was decided to recommend the City Council to proceed with a scheme for widening Cookridge Street.

Institute of Sanitary Engineers.—At an examination in practical sanitary science held on March 23rd and 24th, C. B. Burnett (Camberley, Surrey) and J. Haworth (Ramsbottom) passed, qualifying for "Membership"; and E. Lumley (London), for "Associateship."

Bacterial Treatment of Sewage.—The Rivers Committee of the Manchester City Council have prepared copies of correspondence with regard to the bacterial treatment of sewage in Massachusetts. In one of the letters, dated March 3rd, Mr. L. P. Kinnicutt, director of the chemical department of the Worcester (Massachusetts) Polytechnic Institute, says:—"In America, or in Massachusetts, sewage is successfully treated bacterially by the intermittent filtration method, and at the rate of 50,000 to 90,000 gallons per acre per day; but we have had no experience with the English method of bacterial treatment, namely, contact beds, as all the towns so far called upon to treat their sewage have had sufficient sandy soil to use intermittent filtration beds, and the cost of this kind of land is so little that beds of this character can be constructed at a much less price than the contact beds."

Leeds Sewage.—The Leeds Sewerage Committee met on Thursday to consider the question of a new sewage disposal scheme for the city. For more than two years they have been carrying out at Knostrop a series of exhaustive and varied experiments in the biological treatment of sewage, but they now recommend the purchase of a large site at Gateforth, consisting of 1,882 acres, situated in the lower valley of the Aire, about five miles east of Selby and fourteen miles from the present works at Knostrop. The levels are such that the sewage could be flowed to the site by gravitation, whereas on any site nearer to Leeds the sewage would have to be lifted by pumping. The purchase price is £85,000. Biological treatment would probably be adopted. An interim report bearing on the earlier experiments was issued in 1898, and a full report on the latter experiments is likely to be issued in a few months.

The John Millard Memorial Chapel, Bedminster, Bristol, was opened on March 28th. The building is of brick, with Bath stone dressings, and is situated in Garnet Street. Mr. G. H. Oatley was the architect, and Mr. A. Dowling the builder.

Extension of Christ Church, Gloucester.—The new chancel of Christ Church, Gloucester, was consecrated on Thursday last. The church has been considerably enlarged and internally improved, and a new west front, representing the Lombardie style, has replaced the old one, the total cost of the alterations being about £2,500.

Swansea Board of Guardians and its Architect.—At a meeting of the Swansea Board of Guardians on Thursday the position of the Board with respect to the architect (Mr. W. H. Wills) who prepared plans for the extension of the workhouse, since abandoned, was again brought up. It was eventually decided that terms agreed on between Mr. Wills and a sub-committee be accepted, which means that Mr. Wills is retained as the Board's architect and that he be paid for the work he has done in connection with the old plans on terms agreed to.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDING—			
April 6	Halifax—Shed	M. Hall, 29, Northgate, Halifax.

New Patents.

These patents are open to opposition until May 7th.

1899.—Window Locking Devices.—4,389. R. ADAMS, London, S.E. Attached to the window is a rack which passes through a fixed box containing a pinion, a cam wheel, and a pawl. By means of a key or pin the pawl can be pulled out of contact with the pinion, and the window operated as desired, being afterwards automatically locked by the pawl falling into a depression in the cam wheel and engaging with the pinion.

Sewage Filtration.—4,907. M. J. F. THIRIAULT, Paris. The sewage is passed on to a bed of peat or turf by simple or multiple filtration, and when this has become saturated it is dried and sold for agricultural purposes as concentrated organic manure.

Stained Glass.—6,194. GATESHEAD STAINED GLASS COMPANY, LIMITED, of Gateshead, and J. E. SNEE. A pattern or figure is first ground, cut, or pressed in the surface of the glass and, after polishing or frosting, the pattern is coloured or tinted; the colour is then burnt in.

Surveying Instruments.—7,864. W. F. STANLEY, London, W.C. In combination with the instrument there is a train of wheels which actuate a series of counter dials and so indicate the horizontal or vertical angle through which the telescope has passed. Another part of the invention consists in the use of a diaphragm fitted with compensating points or lines to give direct base reading, allowing for difference of hypotenuse and base when inclination readings are taken, actuated by rack work or other gear in connection with the horizontal axis of the telescope.

Brick-Making Appliances.—8,722. F. JOHNSON, Leeds. Instead of being circular in cross section, the mouth-piece is of polygon form. This prevents the clay revolving with the pug shaft and improves the driving power, so increasing the output and removing undue torsional strain on the pug shaft.

Non-Conducting and Fireproofing Materials.—9,784. A. LANTZKE and A. JUENGER; both of Brooklyn, U.S.A. The material consists of three layers—outer layers of flexible pure (or nearly pure) asbestos, and an inner layer of fibrous material saturated with an incombustible hardening solution to give rigidity to the sheet, which is corrugated.

Portable Elevators for Building Materials.—14,169. J. CANDLISH and C. GODDARD; both of Lytham. Briefly, this apparatus is like a ladder with an endless band mounted between it, carrying buckets or brackets and running over rollers at intervals. There is a large roller at the top and bottom, and the elevator can be driven by hand or mechanical power.

Edge-Pan Runners.—20,074. A. SABINE and T. SABINE; both of Swadlincote, Derbyshire. The outer rim of the runner is built up in sections so that the parts most subject to hard wear can be easily replaced.

1900.—Heat Radiators.—1,492. G. C. DYMOND, London (C. Clarke, Northampton, U.S.A.). A foot warmer consisting of a hollow metallic chamber divided into two compartments is attached to the radiator and can be moved laterally as desired.

The following specifications were published on Saturday last, and are open to opposition until May 14th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—4,983, BROOKES (*Gardim*), apparatus employed in checking and recording the attendance of workmen. 5,211, MILLER, electric incandescent lamps. 5,228, CONN, manufacture or treatment of paper used for ornamental printing, wall decorations, and for other purposes. 5,344, CARR, planks or scaffold boards for the use of house decorators, builders, &c. 5,460, WISE (*Thowles*), incandescent bodies for electric incandescent lamps. 5,466, ELLINGTON, tables, cabinets, desks, and similar articles. 5,512, RODNEY, locks. 5,539, PAR-

KER, mechanism for controlling and aiding the closing of doors, flaps, and windows. 5,735, PRESTON and RALSTON, ventilation of sewers. 5,790, JORDAN, stencil plates and system of printing from them. 6,054, BRDITSCHIEVSKY - APOSTOLOFF, electric lamps. 6,525, WANDERPEPEN and VAN BERCKELAER, apparatus for the production or generation of gas of high illuminating power. 7,588, BAKER and BAKER, smoke-consuming fire bridge for furnaces. 8,005, MCINTYRE and SANITARY VENTILATING SYNDICATE, LTD., air propeller and cistern for ventilation of water-closets and other apartments. 8,013, POWELL and HANMER, acetylene lamps. 8,137, LAKE (*Marcus*), glass lights for windows, gratings, &c. 8,301, HOWELL, HUMPAGE and JACQUES, hoists, winding gear, &c. 8,426, OATES, earthenware or sanitary mangers for horses and cattle. 8,450, GRANT, fresh-air inlet sewer, manhole, and lamp-hole covers and frames. 8,889, BARCLAOUGH and HEATON, machinery and mixing varnishes and similar liquids by mechanical means. 9,035, PESTEL, acetylene gas apparatus. 9,126, SNUGG, means for regulating gas pressure in incandescent gas lighting. 9,295, MILNE and CHESHIRE, inlet and shower or spray fitting for baths, lavatories, &c. 9,625, ROBINSON, manufacture of glazed or fireclay bricks, tiles, &c. 9,652, HATMAKER (*Just*), paint. 9,946, HIRST, method and means for paving. 10,039, WOODMANSEY and BRINS OXYGEN CO., LTD., apparatus for detecting gas leakage. 10,599, ADAMS, NEALE and SIMPSON, brick machines. 11,400, HOGG, apparatus for trimming the sides of roads. 12,894, LEE, locks and latches for doors. 16,650, PETERSEN, conduits suitable for electric mains. 19,813, WILMOT, wrought metal radiator.

1900.—BECK, clamps for fret-saw and similar work. 477, MOFFAT and DOBBINS, light-projecting glasses for windows. 756, CROIZAT, apparatus for lighting and extinguishing series of street and other gas lamps. 2,249, ROBINSON, tenoning machines. 2,337, LE MAT, acetylene gas apparatus. 2,672, NIELSEN, manufacture of media for incandescent lighting.

THE above photograph represents the "Furnisher" stand at the Furnishing Trades' Exhibition, which opened, at the Agricultural Hall, on March 26th, and closes to-morrow, April 5th. The "Furnisher" is a monthly journal devoted to all branches of the furnishing trade, and has already attained the leading place among its contemporaries. The articles are written by experts of the highest authority, and the illustrations are produced in a form never before attempted by a trade journal.

New Companies.

The Clyde Pottery Company, Limited.

This company was registered with a capital of £20,000 in £1 shares to acquire and carry on the existing business of earthenware manufacturers. Registered office: Pottery Street, Greenock.

John Hutchinson and Company, Ltd.

This company was registered on March 22nd with a capital of £1,000 in £1 shares to acquire the business carried on by A. H. Hutchinson as John Hutchinson and Co., and to carry on the business of brick, tile, and terra-cotta makers, &c. Registered office: Price-street, West Bromwich, Staffordshire.

Halward, Cole and Thompson, Limited.

This company was registered on March 23rd with a capital of £5,000 in £1 shares to acquire the business now carried on by T. W. Halward, T. A. Cole and T. Thompson as Halward, Cole and Thompson at Selly Oak, Worcester; and as builders, contractors, &c. The first directors (to number not less than three nor more than six) are T. W. Halward, T. A. Cole, and T. Thompson.

Bangor Range Slate and Minerals Company, Limited.

This company was registered on March 19th with a capital of £6,000 in £1 shares to acquire a certain mining property at Llanwnda, Carnarvon, known as Carregfawr Cae Sgubor Gelfchedd and Tyddn Carregfawr, or Treflamucha, and to carry on the business of miners, metallurgists, &c. Registered offices: 34, Leadenhall Street, E.C.

Hemingways, Limited.

This company was registered on March 10th with a capital of £85,000 in £1 shares to acquire the business proposed to be carried on at Haverton Hill Works, Stockton-on-Tees, by Messrs. Hemingway, Hemingway and Forbes, and to carry on the business of manufacturers of iron, steel, and bridge work, roof work and

girder manufacturers, etc. The number of directors is to be not less than three nor more than seven.

Ralph Martindale and Company, Limited.

This company was registered on March 21st with a capital of £35,000 in £1 shares to acquire the business of R. Martindale and Co., Ltd., and to carry on the business of edge-tool manufacturers, builders, carpenters, engineers, etc. The first directors (to number not less than three nor more than seven) are R. S. Sadler, T. R. Martindale, and B. Arthars.

Elder's Navigation Collieries Limited.

This company was registered March 5th with a capital of £50,000 in £10 shares to build coke ovens, as producers of gas, and suppliers of coke for the purposes of light, heat or power, brick and tile makers, &c. The first directors (of whom there shall be not less than two nor more than five) are A. L. Jones and W. J. Davey.

Kelham Brick Company, Limited.

This company was registered on March 22nd with a capital of £5,000 in £10 shares to acquire certain land at Kelham, Nottingham, and to carry on the business of brick, tile, pipe and earthenware manufacturers, &c. The first directors (to number not less than three nor more than seven) are A. C. Sutton, E. F. B. Fell, Colonel E. J. Fell and Rev. C. N. Sutton. Registered office: The Brick Works, Kelham, Notts.

Hands, Limited.

This company was registered on March 8th with a capital of £50,000 in £1 shares to acquire the business carried on at Garlick Hill, Hatchet Court, and Snow Hill, London, and elsewhere, under the style of A. C. Hands; at Hatton Garden, E.C., as W. T. Burbey and Co., and at Birmingham as H. Davis; and to develop the business and as art metal workers, machinists, &c. The first directors (of whom there shall be not less than three nor more than six) are A. C. Hands, W. T. Burbey, H. Davis, G. Hands, B. H. Jenkinson and one to be appointed by the Law Guarantee and Trust Society.

An Architectural Causerie.

The Sale of the Borghese Gallery.

No lover of art visiting Rome should fail to inspect the Villa Borghese, made so famous by poets and

prose writers as a place almost paradisaic and divine, whose trees and fountains and gardens inspired Goethe, whilst writing Tasso and Iphigenia; and no one who has never visited the Villa Borghese can have the least idea of the princely pomp of the ancient families of Rome. This imposing villa is situated at Pincio, between the Porta del Popolo and the Porta Pinciana, the grounds on which it stands being about four miles in circumference. It was built by order of Cardinal Scipione Borghese, the nephew of Paolo V. (1605-1621), the designs being furnished by Giovanni Vasanzio. Towards the end of the same century, the building was enlarged by Prince Marcantonio Borghese, under the direction of the architect, Antonio Asprucci. Later on, D. Camillo—a relative of Napoleon Bonaparte and afterwards Marcantonio the Second—added to and beautified this residence, and now we have before us an ensemble which, for richness and beauty, has no equal.

But it is not alone the wonderful architecture of the villa, the beauty of its courtyards, of its gardens, of its neo-classic chapels, its statues and the sculptured ornament which one sees on every side; it is not for these alone that the Villa Borghese is renowned; they form only a small part of its artistic treasures. But it is the picture gallery which is its greatest treasure, and it would indeed be difficult to conceive how any one family could possibly have amassed such a collection of pictures which may be seen to-day in the first storey of the villa. These pictures once occupied twelve rooms on the ground floor of the Borghese Palace in the city of Rome, but they were transferred to their present abode some time back on account of the dampness of the palace.* To describe, in detail, even briefly, the pictures of the Borghese Gallery would be far beyond the scope of the present article; indeed, it would require a volume to do justice to them. For, besides 700 paintings, there are some very fine pieces of sculpture, among which are the celebrated group of Apollo and Daphne by Bernini, and the renowned statue of Venus by Canova. The collecting of these pictures was begun in the first decades of the seventeenth century by Cardinal Scipione Borghese. It may have been for the love of art, or it may have been from the Spanish characteristic love of pomp, perhaps both, but whatever the motive might have been, the collection of pictures in the Villa Borghese is one of the most famous in the world; famous alike for its size and for its splendour.

Within very recent years the Russian Government offered 25,000,000 francs (£1,000,000) for the complete collection. The names of a few of the masters will suffice

to raise enthusiasm and excite curiosity: Lorenzo di Credi, Raphael, Titian, Sodoma, Domenichino, Garofolo, Ortalano, Solaro, Pierin del Vaga, Francia, Parmigianino, Andrea del Sarto, Dosso Dossi, Palma il Vecchio, and many others.

To-day public attention is fixed upon the impending acquisition of this collection by the Italian Government. The papers necessary for the purchase were recently drawn up and laid before the House of Representatives by the Ministers of Public Instruction and Finance. The sum proposed is a very much lower figure than that offered by the Russian Government, namely, 3,700,000 francs (£148,000), a difference of £852,000! Apart, however, from the question of local preference, an estimation of the value of a work of art can, at best, be only approximate, and the price of a statue or of a painting is influenced by so many causes that even experts rarely agree. Now, with regard to the Borghese

Minister of Public Instruction the following explicit declaration:—"We will forego the sum of £148,000 if the Government will leave us in absolute and free possession—with right of exportation—of one picture of our artistic collection, namely, "Sacred and Profane Love," by Titian.

It would, however, be indecorous for the Italian Parliament to accept gratuitously the Borghese Gallery, and leaving, too, one of its finest jewels to take to itself wings and fly to distant shores; and still more indecorous would it be for a State to accept presents when the acceptance implicates almost an offence to its dignity. The diversity of opinion among the experts with regard to the Government's offer is extraordinary; yet more extraordinary is the fact that one picture alone should be valued at a higher figure than that offered for the whole collection. Besides the pictures already named there are in this gallery

PULPIT, CHURCH OF SANTA MARIA MADDALENA, FLORENCE.

Gallery, the sum offered by the Italian Government is far below any of the estimates upon the value of the collection. Let us take, for example, a few of the best pictures. There is the celebrated "Danae," by Correggio. This picture has been estimated at £40,000. Then there is "The Descent from the Cross," by Raphael, which is also valued at £40,000; but Titian's "Sacred and Profane Love" is valued by some at £80,000 and by others at from £100,000 to £150,000. (It was recently stated that Prince Borghese had been offered £200,000 for this picture.) Judging from this, the sum proposed by the Italian Government for the whole gallery is more than absorbed by three pictures alone, or by one picture if we attribute to the painting of Titian the value of £150,000. Concerning this latter estimate, the following incident in the negotiations will lend colour to the fact that it is not very wide of the mark. Prince Borghese recently dispatched to the

"The Descent from the Cross," by Garofolo; "The Hunting of Diana," by Domenichino; an "Ecce Homo," by Solaro; a half-figure of the Saviour, by Marco d'Oggiono; "The Descent from the Cross," by Ortalano; a fine "Crucifixion," by Van Dyck; and "The Descent from the Cross," by the same.

The gallery also contains works by Teniers, by Brouwer, and by Potter, whom I mention in order to indicate the great variety of works which the gallery possesses. This fact confirms the absolute and indisputable importance of the Borghese Gallery; and however things may shape themselves in relation to its sale, it is, and will remain, upon Italian soil; for it is impossible to believe that Italy—a land whose greatest glory is art—will ever lose such an opportunity of possessing a collection of the first order, of the most important private picture gallery in the world, and—if we except the masterpieces of the Vatican—the first gallery in Rome.

ALFREDO MELANI.

* The Borghese Palace is one of the finest and richest buildings in Rome. It was commenced in 1590 by Cardinal Dezza, the designs being furnished by Martino Longhi, the elder. It was finished during the time of Paolo V. (1605-1621).

Why Not Embank the Surrey Side?

THE greatest improvement effected in modern London is unquestionably the Thames Embankment. Looking across from it to the Surrey shore of the river the eye rests upon a confused, smoky, manufacturing suburb, a growing forest of ugly chimneys, some hideous advertisements, relieved here and there indeed by a few honest attempts at commercial architecture at the waterside, and the excellent outline of the Shot Tower. Why not embank this side and thus worthily complete the scheme of the old Metropolitan Board of Works? The cost of carrying out the Victoria Embankment was not excessive; a beginning has already been made on the south side by embanking a section from Westminster Bridge to Vauxhall, and an opportunity would be given of putting an end to the floods in Southwark which are now caused by every exceptional rise of the Thames. Beginning at London Bridge, the fine church of St. Saviour's, Southwark, would be visible from the new roadway and the river; it would be restored in fact to its original condition, as it is believed that a garden descended from it to the water. But a roadway alone would hardly meet the views of those who wish to see London made worthy of its rank and importance. A long succession of gardens well planted, with here and there a group of statuary, should be laid out, and the width of this strip of greenery should be ample; the system recently commenced of building up to the very verge of all available land, instead of the old "squares" and "crescents," and the disappearance of gardens from the building plans of new suburbs, make fresh air and trees more valuable than ever; and what has been done with one bank of the river could be done with the other. In all probability the design of a simple retaining wall would be adopted, as on the Middlesex shore; it is to be hoped, however, that a little more originality and care may be exercised, when the time comes, in the detail, in landing places, and in such architectural ornament as may be permissible. The full value of the existing embankment has never been obtained by Londoners because of the absence of shops, cafés, kiosks, and places of reasonable refreshment, beside the gardens; the embanking of the south side should not be marred by a similar mistake. The neighbourhood is a poor one, and if the new gardens were treated attractively immense numbers of the working classes could obtain a glimpse of the great stream and its buildings, and breathe an air in the summer evenings which at high tide is often impregnated with the sea; no mere "recreation ground" could compare with it for a moment. It would terminate at Westminster Bridge; here the pavilions of St. Thomas's Hospital would be a worthy pendant to St. Saviour's at its commencement; the whole work would add enormously to the amenity and grandeur of London; it would be hard to match the total effect of both banks thus treated, by any urban view in the world. And it may be fairly said that the proposal is in accordance with metropolitan tradition. For centuries the Thames was bordered with gardens attached to the houses of the great families, whilst the river was the favourite highway; it was bright with sails and gay with barges rowed by "watermen" and retainers in picturesque dresses. Even so recently as the last century, Canaletto declared that London and Venice were the two most picturesque cities in Europe. Having restored the banks, an improved service of steamers would alone be required to make a journey on the Thames one of the wonders of the world.

J. C. P.

On Reflection.

Preservations and Demolitions.

THE discussion at last week's meeting of the London County Council with reference to No. 17, Fleet Street has caused both pleasure and fear to those who wish to see the historical relics of London preserved—pleasure because it was decided not to pull down the bogus "palace," fear because this was only agreed to by a majority of one. This shows that there is a strong "modern" body in the Council, and at a future date these may sweep away the old when it happens to be of less interest or importance than the Fleet Street building. Mr. Robinson gave expression to a feeling far too prevalent when he said: "If the proposal is carried out it will involve a wanton and wicked waste of public money." The right view was that expressed by Mr. Burns, who said that a Council unsusceptible to the dictates of art could not be sympathetic to the sufferings of the poor. One thing is very certain—the average member of a town council or a vestry board has very little sympathy indeed with art, and is so doggedly prejudiced against it that he will make no attempt to put his opinions to the test. It has already been pointed out that we ought to treasure the bits of old London that still remain with us, but whenever there is an opportunity of doing so a great hue and cry is raised about waste of public money. The case would be different if these old buildings had not such stirring historic traditions attached to them and were of less architectural merit; yet there is a party who would pull them all down as so much rubbish and replace them with some of the prosaic and commonplace buildings which are usually erected to-day at the expense of the public authority. It is only just by a scrape that No. 17, Fleet Street is to be preserved; but one must be thankful for small mercies, and a patron of the old might in this case remark that a miss is as good as a mile.

Architects as Furniture Designers.

WE referred last week to the Furniture Trades Exhibition, and pointed out the evidence it affords of the low level to which the cabinet-making trade seems to have fallen in these days. But there is one consideration that seems to be specially worthy of the attention of architects. How seldom do public or private clients consider the question of furnishing in relation to the building; they are too often content to purchase a number of incongruous pieces from a manufacturer who turns them out by the hundred, repeating the same design again and again with mechanical exactitude, but without reference to special requirements. It is perhaps essential to cheap production that hundreds of pieces of furniture should be made to the same pattern and placed in houses where they may or may not harmonise with the architectural character of the room and with the rest of the furniture. But in catering for moderately well-to-do clients it is a pity that our makers do not generally recognise the fact that the money spent on a number of expensive pieces of furniture, which, though individually beautiful, give a sense of incongruity when regarded as a whole, would suffice, if wisely directed, to furnish a room possessing distinct artistic individuality, the various parts co-ordinating with the whole and with each other, and producing a *tout ensemble* that would reflect credit on the taste of the designer and the owner.

It is a good rule that the architect who designs a building should design also its furniture, and, though considerations of expense may make this sometimes impossible, it would be well for architects in their own interests and for the sake of the artistic completeness of their work to impress upon their clients the close inter-relation between architecture, decoration and furnishing, and to qualify themselves for carrying out all three. A building in which the architect's work extends only to the completion of the structure, and which has then been delivered up to the decorator and the furnisher, who perhaps work independently of each other and of the architect, is infinitely less likely to be an artistic success than if one mind controlled the whole.

Leasehold Enfranchisement.

AN interesting discussion took place in the House of Commons on Wednesday last on the "Tenants in Towns Improvement (Ireland) Bill." The main object of this Bill is to remove certain disabilities from which Irish town tenants suffer, as they cannot afford to pay the high rents that obtain in England and Scotland. Mr. Smith-Barry (Huntingdon) said that the Town Holdings Committee of 1886 reported in favour of the leasehold system, as it encouraged more than the freehold system the building of houses, and by that means the working classes were able to obtain a great selection of dwellings at low rents; while dealing with Ireland the report stated that there were no special circumstances which warranted the separate treatment of that country. This statement Mr. Seale-Hayne (Ashburton) considered incorrect, for while the Town Holdings Committee reported against the enfranchisement of leaseholds as a general scheme, they certainly recommended the enfranchisement of leaseholds in certain limited areas. Probably few people realise how essentially English an institution is the long building lease. Mr. Seale-Hayne made the curious statement that he believed there were no countries in Europe except England and Turkey where such a thing as a long building lease was known. The effect of this upon our national architecture is a matter well worth considering. We did not shine, said Mr. Seale-Hayne, in the artistic merits of our buildings—on the contrary, many of our English towns compared most unfavourably with Continental towns. The reason was obvious. People would not spend money except on freehold. They spent as little as possible on leasehold. The palaces of Genoa and Northern Italy were not built on building leases, and the system of building leases had never permitted the erection of fine artistic buildings. Even in London the few artistic buildings we had were built by noblemen on their own estates. This restriction on building enterprise affected the working classes, because if there were facilities for expending money and the man who expended it had some hope of its coming into the pocket either of himself or his descendants instead of going to some rich landlord, as was the case now, there would be more work for the working-classes and for the better class of labour. Sir E. Durning-Lawrence (Truro) interrupted with: "All the clubs in Pall Mall are built on leasehold"; but Mr. Seale-Hayne said he was referring to private houses. If the clubs in Pall Mall were not built on leasehold, instead of being mere copies of other buildings they would be far finer than they were. Eventually the second reading of the Bill was rejected by a majority of eighty-eight, so that whatever merits the Bill really has it will not yet be possible to test them.

SOME NOTES ON SPANISH
IRONWORK.—I.

By F. HAMILTON JACKSON.

IT is a commonplace of criticism that just as individuals have special aptitudes for some one form of mental activity, or special dexterity in one craft or another, so certain nations have shown a bias towards certain pursuits or an impulsion in one direction of art craftsmanship. And just as in the case of the individual, at one time of his life he may be engrossed in one pursuit, the interest of which pales with years, while other occupations take the foremost place, so one finds that as the ages pass, that which was most interesting to the nation is thrust aside by other attractions, till it almost appears as if the genius of the people had changed entirely. And yet, again, as some favoured individuals have such well furnished minds and varied capabilities that success in many fields is within their grasp—if they have in addition that persistence in pursuit which lies at the root of most of the greatest successes—so there have been nations so richly dowered that they have produced much with ease what other nationalities attain painfully, if at all, and only by great labour; and their productions have covered wide fields of activity, while less fortunate nations have only succeeded with difficulty in one or two directions. The period of the Italian Renaissance may be cited as an example, when in Italy all forms of art production were pursued by craftsmen with such great success that their works have remained until the present day as standards of attainment by which to measure the efforts of lesser men; a height of achievement which marks the depth to which the national spirit fell during the next two hundred years.

Another of the nations of the Mediterranean littoral has shown itself most richly dowered in the past also, and has indeed produced one great painter who stands very near the summit of appreciation in the opinion of those whose knowledge and cultivation enable them to judge—Velasquez (for it is of Spain that I speak) was probably the greatest painter whom the world has seen—the man who could play with the difficulties of his craft and force hand and brush to express his intention with more success than any other. In qualities of design and pictorial colour he may be surpassed by the great Italians, but no portraits are finer than his, and this implies mental qualities and perceptions of the highest order. But the Spaniards were supreme in painting only in the seventeenth century. Their earlier work of the kind lagged behind that of the Italians, and after Velasquez and Murillo the school sank again into obscurity. It is in other arts of decoration that their greatest successes were obtained—in architecture, in architectural sculpture (often coloured with a gorgeous effect), and ironwork.

There were at least two sorts of design being carried on side by side—the Romanesque developing into the Gothic of the northern provinces, and that form of it which was greatly affected by the Moorish work of those toward the south—though, indeed, the Moorish influence is strong nearly all through Spain. The former is austere and severe in its lines and generally sparing in its use of ornament in the earlier period—but the Moorish liking for gorgeousness of decoration and involved pattern gradually leavened the whole art work of Spain, just as the language changed, becoming full of Arabic words—and although in the later Renaissance styles the fullness of ornamentation became overloaded and disgusting; in the later Gothic, and, above all, in the early Renaissance design, founded upon that of the silversmith, and therefore called "Plateresque," the richness and grace is most charming, and certain of the masterpieces of these periods may challenge comparison with the very finest work of any other nation without fear.

Such works as the monument to Don Juan and Isabel of Portugal in La Cartuja near Burgos—the Capilla del Condestable in the

Cathedral—and the Retablo in the church of San Nicolas in that city, stand quite by themselves, complete and beautiful, crowded with exquisitely-wrought detail, without the loss of breadth, and full of fancy and fine feeling. And then the splendid *rejas*, the iron screens parting the choir and high altar from the space between, of which one sees so many in the Spanish cathedrals—30ft. or 40ft. high, and worked with the same mastery over iron which Velasquez showed over paint—are quite unlike anything to be seen elsewhere, and equal if they do not surpass even the finest German ironwork.

The Spaniards appear to have had a special aptitude for work in iron, and the tradition of good work lasted longer there than in most countries, for I saw a fanlight of very fair design in Madrid with the date 1845 worked into it, a time at which in England taste on the subject was perfectly dead. It is not wonderful that it should be so, for the purple iron ores of Bilbao are very rich; and at a very early period the Catalonians invented a furnace for smelting them which is still in use in remote parts of Europe, and named the "Catalan" furnace. Moreover the country has been continually in a state of warfare from times prior to the Roman conquest, which would stimulate the manu-

facture of arms and armour. It is a curious fact that the fine armour of the Renaissance period was not made in Spain, but imported from Germany—although the celebrated Toledo blades showed that the Spanish weaponsmiths were not surpassed by those of any other nation. And many of the earlier screens in the churches show definite signs of foreign influence, some of the thirteenth century near Madrid resembling so much those produced in the south of France at that time as to suggest that they were imported, whilst there are others showing Flemish influence plainly. But the names of the smiths who produced the finest Renaissance screens are known, and they are Spanish. Another curious fact is that with the expulsion of the Moors in 1609 a blight seems to have settled upon Spanish decorative art, especially upon sumptuous ironwork. The erection of the great *rejas* absolutely ceased after that date, though we know that the workmen were not Moors but Spaniards, as I have said above.

On entering Spain the unfamiliar aspect of the houses is one of the first things to strike the traveller. They generally have huge over-sailing roofs, supported on two or even more ranges of rafters with moulded and ornamented ends from which gargoyles of a curious pattern project still farther. These gargoyles

Fuenterrablia

Barcelona

Window
Grille

BALCONY PANELS

are made of tin or sheet iron and have bell-shaped mouths, behind which is an ornamentation formed of loops of the same metal soldered all round the pipe. This simple decoration gives them a sort of floral look when viewed from the front, and a pleasing complexity of line when seen in perspective. Below the roofs are rows of balconies—scarcely a window being without this ornamental appendage, which the Spaniards find most useful when engaged in one of their favourite occupations—that of leaning on their elbows and gazing up and down the street.

In some of the towns they are enclosed within glass cases which form outside windows, and when there are many of these in sight at the same time they give a most strange and unsubstantial look to the buildings. Valladolid, for instance, as seen from the station looks like a collection of temporary houses run up for summer holiday occupation.

The balconies proper are of all sorts of plans and shapes, but the most usual form is the oblong, with the railings made either in panels of wrought or cast iron, or with perpendicular bars ornamented with twistings and additions

of traceried forms, or with wrought spindling balusters, the angle bars being no stouter than the others, but often distinguished by knobs and spindle-like ornaments projecting above the rail. At Burgos I observed some curious balconies of curved plan and slight projection, the bars of which had one half turn in the middle; this produced a very queer effect. The variety gained by alterations in the grouping of square, angle, and twisted bars with occasional additions of scroll-work is enormous. The drawings will give some idea of it. And the means employed are always simple. Look, for instance, at the shaped balcony from Zaragoza (see inset sheet). The component parts of the design are simple and easily put together, but how graceful the effect! The Segovian balcony on the same sheet is often varied by interposing several plain bars between the quatrefoils, with perhaps better effect, and the one from Tarragona shows the supports with which balconies in Spain are generally strengthened, and by the use of which the smiths knew how to add decorative effect to comparatively plain work. The spindled baluster balcony from Burgos

SMALL GRILLE AT LAS HUELGAS, BURGOS.

is an example of peculiarly Spanish work. Whether they were turned after being roughly hammered to shape, or struck while hot into a mould, which would require several heatings to complete each baluster, I do not know; it was one of the secrets of the ironworkers, but the Spanish smiths appear to have had complete mastery over the metal, shaping it as easily as if it were lead, and these spindled balusters are to be seen in Spain by the thousand, while outside of that country they are rare. I shall have more to say about the working of iron when speaking of the *rejas*. On the previous page are shown several traceried panels of various dates from Fuenterrabía, and several from Barcelona, most of which again show how a good decorative effect may be gained from the repetition of very simple forms. One of the Barcelona patterns is still in use, and was used for the rail on one floor of my hotel, but apparently without intelligent choice, for the next floor had an abominable design in cast-iron.

As one walks along the streets of many of these old towns, fine knockers of hammered iron catch the eye, attached to old weather-beaten doors with little paint upon the wood, and studded with great ornamented nail heads, or with plates of iron, cut into shapes and bossed up picturesquely, fastened with many nails to the wood to strengthen the doors. At Burgos these are generally plain, diamond-shaped pieces, but at Segovia, Fuenterrabía, Toledo, Zaragoza, Tarragona, and Barcelona they are often elaborately cut and worked, pierced sometimes without bossing, as well as bossed and pierced. The great nails are most frequently seen at Toledo and Segovia; some are shown in the drawings of knockers from the latter town.

At both of these places the Moorish influence was very strong upon architecture and architectural decoration, in which, of course, the ironwork shared, as may be seen from the examples given. It is quite possible that some of these are the work of Moorish craftsmen, who were extremely dexterous in metal working. They show the combination of forged work and thin metal pierced and bossed, so characteristic of Spanish ironwork, and all stages of finish, from the work which depends for its effect entirely on somewhat rough hammering, with an occasional file or punch mark, to that which has highly finished small mouldings and subsequent chasing, like the lion knocker and door fastenings from S. Gil, Burgos. This door fastening, by the way, is a typical one, of which one may see numerous examples all over the north of Spain; the latch fastens the small door in the larger one, which the long bolt secures. It is a rare thing to find a knocker which hangs straight, and the fastening or plate is generally crooked, even if the knocker be without a twist; the later and more elaborate Renaissance work sins as much as the earlier in this respect. There is a very fine knocker of the more elaborate sort at the hospital at Barcelona, and Tarragona Cathedral has four on its west door of what Mr. Starkie Gardiner calls "the age of the locksmith"; the knocker itself being wrought,

PORTION OF CRESTING OUTSIDE DOOR OF NORTH TRANSEPT, CATHEDRAL, TOLEDO.
DRAWN BY F. HAMILTON JACKSON, R.B.A.

but the mounting being mainly made of pierced plates of elaborate design, superposed in retreat on a coloured ground. They are very fine pieces of work, but I rather wish to avoid what may be called "Museum" specimens, which can never be of general use. The hinges of this door at Tarragona are worked in the same way. Hinges rarely call for notice in the Spanish churches. They are generally mere straps of metal with, perhaps, trefoil heads and similar trefoils projecting along the edges, as at San Pablo, Zaragoza.

After the doors come the windows, which are generally fitted with grilles in all good houses, at least on the lower floors. The older grilles are generally simple in form, frequently consisting but of bars crossing and interlacing at right angles with, perhaps, projecting rivets at certain of the crossings. Later grilles consist either of upright bars terminating in floriated ends, with (very often) an architectural cresting cut out of thin metal and riveted on to hide the crossbar, like the one from the cloisters, Tarragona (see inset sheet); or the bars may be split and worked into ornamental forms, as in the one from Segovia, in the same way as the balcony rails frequently are. The projecting curved "knee grilles" are quite late in date, and those that I saw were mostly poor in design. The one drawn at Tarragona was one of the best. It was made of riband iron riveted at each crossing place.

The grille from Barcelona, composed of several panels, was made in the same way—one would scarcely think that such light work would be very much protection. The little circular grille from Toledo struck me as being very graceful in composition, the small bit of pierced work in the centre coming in very happily. Close to this was a very fine railing, through which one went to the door of the north transept of the cathedral. (A drawing of a portion of the cresting is given above.) The bars are octagonal, and are shaped and moulded so as to suggest caps and bases; there are two ranges of them, and they stand upon a sort of base, the two ranges being divided by a band of metal cut into patterns, somewhat like the one at the top for part of its length, and bearing an inscription, also pierced, on the other part, being, of course, without the little turrets; these ornamental bands hide the crossbars. The cresting is put on with a refreshing disregard of regularity and of the position of the ornamental details below. This grille resembles the internal *rejas* somewhat in the arrangement of the construction and ornamentation, though much less lofty and elaborate than they frequently are. At Burgos, in the cloister, are some interesting early grilles erected in front of tombs to protect them. I give drawings of portions of two which are quite simple in their component parts, but very effective when they are put together. Here, again, one sees an absolute disregard for points to which a modern designer would be

sure to attend. The flowers in the band of ornament are not of the same size, nor are they spaced with regularity, and the prickets above

are welded to the crossbar behind without regard to the grille bars below. In the second, in which one set of bars threads through the other set, the panels of ornament appear to be arranged almost by chance, as if the smith had a few left over and sorted them out as best he could to fill the space. The running pattern is much the same in each, but one panel has it put upside down for variety. It is cut out of thin metal, bossed and then chased, being backed up with colour. The central shield bears a large fleur-de-lis, the side shields are alike. The architectural forms are well considered and appear to have been struck into a mould without subsequent filing, though the larger pieces are put together cold. The little grille from Las Huelgas (shown on the previous page) is of later date, and is painted and gilded; it also is put together cold, except for the rings which attach the scrolls to each other and to the uprights; it is a small example of the screen with ornamented balusters which, when large, is so imposing.

(To be concluded.)

A new Baptist Chapel at Huddersfield has been built from designs by Councillor Berry at a cost of £2,760. The building is situated at Scapegoat Hill and is 61ft. long and 39ft. wide. Accommodation is provided for 600 worshippers.

SOME SPANISH DOOR-KNOCKERS. DRAWN
BY F. HAMILTON JACKSON, R.B.A.

ARCHITECTURAL ASSOCIATION.

Study and Planning of Collegiate Buildings.

By BASIL CHAMPNEYS, M.A.

A MEETING of the Architectural Association took place last Friday evening at No. 9, Conduit Street, W., Mr. G. H. Fellowes Pryne, the president, in the chair. The minutes of the previous meeting having been read and confirmed, Mr. J. A. Bond was elected a member of the Association, and then it was announced that Mr. A. Atkinson and J. P. Clark had been reinstated members. On the motion of Mr. R. S. Balfour, hon. secretary, a vote of thanks was accorded to Messrs. A. Waterhouse and Son for the visit of members to their new buildings for the Prudential Assurance Company on Holborn. The president then announced the following House List for the ensuing session:—As president, Mr. W. H. Seth-Smith; as vice-presidents, Messrs. W. A. Pite and R. Elsey Smith; the Committee, ten of which are to be elected, Messrs. L. Ambler, A. Bolton, W. A. Forsyth, M. Garbutt, H. T. Hare, A. H. Hart, A. W. Hennings, F. G. F. Hooper, W. B. Hopkins, G. A. Lansdown, P. J. Marvin, H. P. G. Maule, A. B. Mitchell, G. H. Fellowes Pryne, W. H. Raffles, E. A. Rickards, H. A. Satchell, E. Howley Sim, A. B. Thomas and R. H. Weymouth; as hon. treasurer, Mr. Hampden W. Pratt; as hon. librarian, Mr. A. S. Flower; as hon. secs., Messrs. G. B. Carvill and R. S. Balfour; as hon. solicitor, Mr. W. H. Jamieson; as hon. assistant librarians, Messrs. A. A. Carter and F. J. Osborne Smith; as hon. auditors, Messrs. W. E. Davis and E. Greenop; as secretary and registrar, Mr. W. G. Driver.

Mr. Basil Champneys then read his paper on "Hints on the Study and Planning of Collegiate Buildings," as follows:—In dealing with the subject of collegiate architecture, I do not propose to discuss at any considerable length its archaeological aspect, but rather to dwell on the practical questions which are likely to present themselves to those who have to deal with collegiate buildings of the present day. It is, however, desirable to say so much with regard to the past as may serve to make clear the ideal which the builders of old set before them, and to show that changes of custom have served to modify the original standards and to present the problems of the present day under somewhat different conditions from those of an earlier age.

Every one knows that at the time when the college buildings at the old universities were erected the students entered on their university career at a much earlier age than is customary at present; also that the standard of expense was generally very much lower than it is in our own day. The same tendency which has influenced so many of our great public schools is apparent in the development of Oxford and Cambridge.

Starting as institutions for the education of all classes, and especially for the lower middle class, they have in a considerable degree become annexed by the more wealthy; and a public school or university education is now considered to be the privilege of the more wealthy, whereas formerly they were designed for the training of all who had sufficient ambition or enterprise, and offered every facility to those who were prepared to face poverty and hardship in the pursuit of mental training.

Another tendency which is apparent in the evolution of university buildings, but altogether dissociated from the conditions above mentioned, is that of centralisation. In mediæval times large and important colleges were the exception, and small halls, each intended for the housing of a few students each, were the rule. Some of the largest foundations both at Oxford and Cambridge have been formed by the absorption of a number of these smaller abodes, which usually have disappeared in the process. Our Oxford College, Worcester, is, generally speaking, a conglomerate of these

smaller establishments, as its present conformation clearly shows.

While the change in the age of the students revolutionised the arrangement of rooms, the increased size and scope of the colleges afforded occasion for larger and more comprehensive schemes of planning, and made effective grouping of the buildings possible.

With regard to the former of these changes, the mediæval arrangement was as follows. A set of college rooms consisted of one fair-sized room, with two or more rooms—usually two—opening from it. The larger room was used as a dormitory, in which a few students and a Master of Arts slept, the master being placed there to keep order, while the smaller rooms were used as studies in the daytime. So long as the students were mere boys, this arrangement was reasonable—not dissimilar to that at some of our public schools, where a "prefect," or "monitor," keeps order in a dormitory of younger boys. As the age of students increased, and as the class from which the students were drawn was simultaneously raised, this arrangement naturally gave way to the more modern one. The large room became the living or "keeping" room for a single student, and one of the smaller rooms or studies was the bedroom, another being used as a "scout's hole," as at Oxford, or "gyp-room," as at Cambridge—a sort of pantry, larder, and coal-cellar in one. In many colleges the division of the rooms remains in its original state, the only change made being their re-assignment according to the new method. In other cases some structural modifications have been made, and, as it very frequently happened that only the outer walls and the cross-walls which carried chimney-stacks were of masonry, the rest of the structure being mere partitions, such adaptations were easily made without any radical change.

The great increase in the size of colleges opened the way to the development of collegiate planning on an extensive scale, and suggested the type which nearly all existing colleges to some extent illustrate—the grouping of the buildings into one, two or more quadrangles of rather low buildings. In the original colleges there are never more than two floors and an attic, from among which the special and more important features are the chapel, the hall and the library.

The lodging of the president, warden, principal, master, or whatever he may happen to be called, was usually included in the general grouping and are seldom distinctive features in the older college buildings. In the present day the head of the college usually requires a more sumptuous abode, which must become an important item in contemporary college building; while the fact that many of the tutors and fellows are now married will also serve to complicate the future of collegiate grouping.

Besides the hall, chapel, and library, it was usual to mark the main entrance of the college, often, too, the side entrances, or entrances to a further quadrangle, by towers—a reminiscence, no doubt, of defensive architecture, in which all approaches had to be specially guarded.

For the students' rooms, the general arrangement is most invariable. A staircase entered from the quadrangle led to rooms on either side; and, as there were three floors, opened out six sets. This arrangement is usually adhered to in contemporary schemes, as I think with good reason. The alternative plan adopted by Mr. Butterfield at Keble College is to make the main block of rooms sufficiently wide to accommodate two sets of rooms in depth, with a central corridor from which the rooms open. I do not think, however, that this arrangement is likely to find general favour. It is not favourable to effective grouping, as the blocks of rooms are apt to look bulky and clumsy; and as regards economy, I made on one occasion the most careful comparative estimate of the two methods and found that the older gave an equal amount of accommodation at considerably less cost. In this case, *stare super antiquis viis* seems to be the best policy on practical no less than on æsthetic grounds.

In the few cases in which a departure from

the ancient type has been attempted the result appears to me to be most unsatisfactory, and completely destructive of collegiate character. At Keble College the architect's intention evidently was to keep the ordinary buildings entirely subordinate to the chapel, and as the chapel is very unusually large and lofty, this idea is not altogether obscured; but it would have been far more completely and satisfactorily developed had the ordinary rooms been planned upon the old-established system. The result seems to be no less subversive of collegiate effect if the ordinary buildings are of four instead of three storeys. The "new buildings" at New College, erected by Sir Gilbert Scott about 1876, seem to me to fail for this and for other reasons. At King's College, a new group of buildings has in recent years been built by Mr. Bodley. Here again a fourth storey was insisted on by the college, and, needless to say, everything that was possible has been done to give them, in spite of this condition, a collegiate character. The fact that this endeavour, even in Mr. Bodley's hands, has not proved altogether successful, appears to me to be the best possible confirmation of my opinion that a fourth storey is necessarily unsuitable to such architecture; while the scheme, that of a three-sided quadrangle with the fourth side open to the line remains and may long remain incomplete in consequence of this unnecessary development of height. The scheme might have been completed for about the same cost as the present truncated instalment.

In both these instances the extra storey had been, I believe, forced upon the architect, and the motive for this dictation was no doubt in a large measure a desire for economy secured by piling up buildings to an unusual height. I have tested the comparative cost of buildings of two, three, or more storeys with the following result:—A building of two storeys is definitely more costly for the same accommodation than one of three; but four or more storeys are not more economical than three. Of course, where ground is limited in extent, or of very high value, a new factor is introduced; but in the case of college buildings this is rarely the case, and there is seldom any valid excuse for departing from the old type.

In fact, the old system of college planning, in my opinion, still holds its own, and needs but few modifications to bring it up to date. A few practical requirements, consequent on the change of custom, have to be met. For example, when a set of rooms was composed of a large dormitory and two smaller studies, it was rather advantageous than otherwise that the smaller rooms should be approached through the larger. This was conducive to quiet in the studies and caused no inconvenience. Now, it is essential that both bedroom and cupboard, or "scout's hole" or "gyp-room," should be independently accessible, though there is some advantage in having a door between the sitting-room and bedroom, as it allows the bedroom, to some extent, to benefit by the sitting-room fire. Again, there is no need for the "scout's hole" or "gyp-room" to be as large as one of the old studies; it need be little more than a mere cupboard, and one of the most modern ideas is to provide for a group of rooms a kind of general "scout's hole," or pantry, with a sink and gas stove.

These are the principal points in which a modern set of rooms differ from the ancient type, which on the whole has vindicated its claim to be applied to modern schemes as the best and most economical arrangement.

Before passing to other phases of collegiate architecture, it may be worth while to consider what was the most highly developed idea of a mediæval college, and of this no better example could be selected than New College at Oxford, which in its ancient form showed a complete design carried out at one time. In order to realise Wykeham's idea it is necessary to remove in imagination certain later additions which have obstructed the original intention; the chief of these is the addition of a storey to the main quadrangle. This raises the buildings to the same level as the gateway tower which originally surmounted them, and also decreases the predominance of the chapel. William of Wykeham was a great Churchman

and his intention was to make the chapel the great feature of his main quadrangle; its great height and scale still preserve its relative importance, though its superiority to the residential portion of the quadrangle is greatly hampered by the added storey. The dining-hall is built in continuation of the chapel, and originally the two were under a continuous roof. Sir G. Scott in his restoration raised the pitch of the chapel roof, divorcing it from the line of the original parapet, with which it now makes an exceedingly awkward angle. The floor of the dining-hall is raised several feet above the ground level, so that the internal height of the hall, though lofty, is much less than that of the chapel. The approach to the hall is by a staircase opening from the main quadrangle under a tower rising considerably above the hall and chapel. In the tower are a series of chambers the purpose of which is not very obvious, but which have the advantage of being in all respects as Wykeham left them.

Opposite the main entrance to the college was the library, the conformation of which can still be traced, though it, too, has been modified by the addition of a storey and the modernisation of the windows. An archway passing beneath the library gives access to the garden quadrangle, which originally consisted of two short projections—one of which still retains its ancient timber roof, and was probably designed for its present purpose, that of a common-room for the Fellows.

To the west of the chapel, a position no doubt dictated by the conformation of the site, are the cloisters enclosing a garth, intended no doubt for abarical ground, and adjoining these at the north-east angle is the very simple but effective bell-tower, the great severity of which is no doubt due to its position as an outwork of the city wall.

The great predominance of the chapel over the adjoining buildings and the presence of the cloister and the tower are somewhat exceptional features in college architecture, and serve to emphasise the ecclesiastical intention of the founder. The same idea is manifest in a college of modern foundation, Keble, which, as a memorial to a well-known Churchman, was founded with a somewhat similar view. Other colleges which bear the impress of a specially ecclesiastical ideal are Christchurch and Magdalen at Oxford, and King's at Cambridge. In the more ordinary type of college the chapel, hall and, in many cases, the library are salient features in the grouping, but their relative importance varies very considerably.

So far I have spoken of the ordinary type of college buildings as developed in the Middle Ages and adhered to in the sixteenth and seventeenth centuries. Modern civilisation has, however, given birth to new phases of collegiate life which involve certain modifications of the original character of the building, though the collegiate standard must still retain much of its influence.

The first and most important of these is the establishment of colleges for women both at Oxford and Cambridge. It is clear that the life in these must necessarily be of a more domestic character than in colleges for men; and if the style of architecture follows the requirement the result will be something which may be called a "domestic college." Access to the several students' rooms can no longer be from staircases entered direct from the open air; the approaches must be properly enclosed and the passages warmed. In Newnham College, the deviation from the original type is greater because the system of the college is that of subdivision into halls, each of which is, on the whole, complete in itself; the only features used equally by the entire college being the great hall and the library. Moreover, the scheme, as it now stands, has been developed piecemeal; has started from small beginnings and grown up step by step, each instalment of the group of buildings having been supposed, at the time of its erection, to be the last until the pressure of applicants suggested a further extension.

Another building which also deviates from the original type on account of a change of purpose is Mansfield College, which

contains all the features of a college without residence for students. Mansfield College is intended to be a centre of life for students of a particular religious denomination living in the colleges of the University, but assembling at Mansfield for services, lectures and for social converse. The only residents are the principal and a few tutors. Mansfield College, therefore, consists of a chapel, a hall, a common-room, with the requisite offices, bursar's and tutors' rooms, and a few bedrooms and several lecture rooms, a large library and a principal's residence. This scheme suggests a somewhat different system of grouping from that usual in colleges of the ordinary type, though at the same time it was for many reasons desirable that the group of buildings should as far as possible reflect the character of Oxford collegiate buildings.

BRICKWORK.*

By W. J. READ.

ONE of the chief factors in the strength of brick walling is the bonding. In London the bottom course of footings must be twice the width of the wall measured at its base. This has caused a method of one course offsets to be used until the normal width is reached. In this case the bricks should always be laid headers to face, and where a half-brick occurs in the thickness of the wall it should be kept as near the centre of the wall as possible. Each offset must be equal to one-quarter brick on each side of the wall, thus diminishing the wall by one-half brick each course. In districts under no limitation, double course footings are frequently used when the under course of each double course is stretcher to face. Where it is possible, the interior or filling-in of all walls is invariably worked header to face. There is one rule of bonding that governs all good work, that of the unbroken transverse joint; and by its use only are perpendicular straight joints avoided.

Generally speaking, only two systems of bond are used, others being variations or modifications, *i.e.*, English bond and Flemish. English bond undoubtedly gives the best results for strength; the chief merit of Flemish bond is its appearance.

In English bond bricks are laid header and stretcher in alternate courses, and difficulties are encountered by inequalities of the bricks. Two headers plus one mortar joint should equal a stretcher, but they do not always do so; hence a difficulty in maintaining a uniformity of appearance and also sectional bond. Flemish bond overcomes this, as the headers and stretchers alternate in the same course, which avoids the previously-mentioned difficulty. But Flemish bond does not produce so much strength internally, and the practice has been general for many years to face the external part of a wall with Flemish bond, the remainder being English. This is to be deprecated, as the result is to produce a wall with a half-brick face tied in with headers only here and there, while some perpendicular straight joints are unavoidable.

Brickwork as a backing to ashlar stone walls presents difficulties. If built in lime mortar, the inequality of settlement in the mortar joints puts an unequal strain on the wall, and if in cement mortar the ashlar work is often stained and discoloured.

Undoubtedly it is best to use cement mortar as backing to ashlar masonry, and if the back of the stonework is rendered or roughly pargeted with lime mortar the cement does not stain through.

With brickwork facings much difference obtains in degree and character. Malm, red, sand-moulded or pressed, and gauged bricks are used with stone dressings, such as quoins, windows, &c, and a point to which I would call attention is the difference in the size of the mortar joint of the brick and the putty joint of the stone. In working stone quoins allowance should be made for a mortar

bed to bond stones where they are bedded on brickwork, and the heights of the jambs might be so considered. It may be remarked that the bricklayer can keep down under his gauge to allow for this, but his joints should be regular.

In gauged brickwork stone should be so arranged and bedded as to relieve the soft rubber bricks of undue weight, as these will crush with little strain.

It sometimes happens that in arches stone and brick are combined, either as composite arches or with keystone only. This, in segmental or semi-circular arches, is a simple matter, but it must not be forgotten that the arch-cutter of bricks needs to get as large a brick on the extrados as possible, and that his courses must be regular and uniform in radiation. This he ensures by traversing his cutting template on his setting-out board. In arches of irregular curve and of the four-centred variety the brickwork needs regular radiation, both for economy of work and appearance.

With elliptical arches this is difficult, but it is invariably overcome by striking an approximate ellipse from centres. When the ellipse is struck by trammel the radiations of the courses may be struck from centres; if not, the arch is traversed by a method of trial and error until the result is what is termed a scheme. Other arches in brickwork when the radiation of bed joints is not normal to the curve are termed schemes. The camber or straight arch is also obtained in this manner. Segmental arches moulded have often presented difficulties in order to obtain intersection of the moulding with the jambs. This has been a subject of dispute for years, but it should be borne in mind that the brick cutter has to work in a box, and he is limited by that.

The best results are obtained by a mitre of the moulding, and by working the skewback from the back line of the moulding. No other method is possible with glazed bricks. Bull-nose and chamfer are affected alike by this rule.

In many parts of the country, especially in exposed situations and by the seaside, walls of houses are built with a cavity, which is ventilated and renders a house perfectly dry, warm in winter, and cool in summer. The advantages and comfort of hollow walls are too great to be disregarded. The usual method is to build an external half-brick wall with a 2in. cavity outside the house wall, forming a tie with wall ties of galvanised iron or vitrified brick.

Just a word with regard to measurement and weight of brickwork. All work in London and the vicinity is measured by the rod of 272 feet super. of brick-and-a-half wall, and all work is reduced to that. One other method is by the cubic yard; there are about 11½ cubic yards in a rod.

The weight of brickwork is considered approximately 1 cubic foot = 112lbs. or 1 cwt., or about 15½ tons to the rod; the quantity of bricks of course varies with their size, but 4,000 to 4,250 is about correct, according as bricks run large or small. For mortar, 3yds. to 1 rod, *i.e.* 3yds. sand, 1yd. lime. For facings which are measured by the foot super., if in Flemish bond, seven bricks are allowed to the foot. If in English bond, eight to the foot. With glazed bricks in Flemish bond the quantity of headers and stretchers should be equal, but in English bond the proportions are 5½ headers and 2½ stretchers to each foot.

Restoration of St. George's Church, Leeds.—The restoration fund in connection with this church now amounts to £4,809 8s. 6d. The foundation-stone of the apse is to be laid shortly after Easter, and it is expected that the church will be closed after Whitsuntide in order that the restoration may be completed. The large picture by Mr. Cope, R.A., which was recently removed from the east end, was cleaned and repaired in 1885, under the advice of Mr. Arthur Cope, son of the artist, and himself a painter of repute. It is now to undergo similar treatment, and when the church is ready for its reception will be replaced at the east end.

* A paper read before the College of Masons on February 27th, 1900.

"BUILDERS' JOURNAL" SHILLING FUND.

LAST week we had an exceptionally long list of contributions to acknowledge; this week's list is proportionately small. We hope this does not mean that our readers' generosity has nearly reached its limit. The fund will remain open for a few weeks longer, and we hope there are still many who will decide before it is too late to take some share in the patriotic and useful work of ministering to the needs of the constantly increasing number of our disabled and invalided soldiers. A correspondent in sending his contribution, writes:—"There is one little thing I have noticed, and it seemed great unto me. After one has explained the scheme and asked for a contribution the gentleman clothed in fine raiment and who fares sumptuously every day will refuse you a 'tanner,' while the man clad in corduroy, who lives from hand to mouth, is generous enough to give something." We are sorry to have had to call attention to this fact before, and we hope our architect readers will prove that, to them at least, this does not apply. Up to the present builders and workmen have come forward almost exclusively. Our offer of a copy of the current issue of "Specification," the invaluable reference book for all connected with the building trades, sold at 5s. net, is still open to anyone who collects twenty shillings for our fund.

The following subscriptions have been received since the publication of our last list:—

	Shillings.

The Executive of the Building Trades Gift to the Nation again have much pleasure in announcing that there was a material increase in the list of contributions in kind during the past month, whilst over £1,300 was brought together in money, including no less than £400 in the form of sixpences and shillings generously collected by the workmen. A considerable amount of material is, however, still required, particularly in respect to timber, joinery, and facing bricks, whilst £5,000 is still required in money. In order to assist in bringing together this £5,000, Mr. J. Randall, as President to the Builders' Institute, when completing his term of office last week, offered £50 if forty-nine similar amounts are subscribed, either as individual sums, or in the form of a combination of smaller items, as, for instance, two mutual subscriptions of £25, or five of £10. Mr. H. H. Bartlett (Perry and Co.) kindly opened this special list by promising two donations of £50, whilst Mr. Howard J.

Colls and Messrs. Holland and Hannen have each given £50 towards this special object. It is further announced that among the interesting gifts in kind during the current week was a large iron church, 50ft. long, presented by Messrs. Dixon and Co., of London and Liverpool. The following additional subscriptions in money are announced:—

A new Post-Office for Huyton, Liverpool, has been erected in Derby Road. The contractors were Messrs. J. and A. Taylor, of Prescott.

A new Workhouse at Wolverhampton is being built at a cost of nearly £200,000. The foundation stone was laid on Thursday last.

The Organ in St. John's Church, Ranmoor, Sheffield, is being renovated and enlarged by Messrs. Brindley and Foster, of Sheffield.

"Valuation of Houses (Repairs and Empties)."—In the account given in "F. S. I.'s" letter under this title on page 147 of last week's issue, the item "Property tax, £2 15s." should have been omitted.

CENTRAL LONDON RAILWAY.

THE new line of railway between Shepherd's Bush and the Bank known as the Central London Electric Railway will be opened in June, says the "Standard." It is practically completed, but a large amount of structural work has still to be done at the various stations. Already a number of trains have been run from time to time, to test the roadway and the engines and carriages. Of course, the metropolis is not the only large centre of population which has adopted the underground system. There is a service of tramcars beneath the surface in Boston; Glasgow has a subterranean tramway service; and in Buda-Pesth the electric cars pass along Andrássy Avenue beneath the roadway. The new line begins at Shepherd's Bush, and the stations are Holland Park, Notting Hill Gate, Queen's Road, Bayswater, Westbourne Grove, the Marble Arch, Davis Street (for Bond Street), Oxford Circus, Tottenham Court Road, British Museum, Chancery Lane, the General Post-Office, and the Bank; but the Eastern terminus, when the line is fully completed, will be at Liverpool Street. In time, also, there will be a connection with the line now in course of construction from Baker Street to Waterloo. The Central London Railway is seven miles long, and in some places goes to a depth of 100ft. There are two tunnels of 11ft. 6in. diameter for up and down trains. The system of construction is that invented by the late Mr. Greathead, and has been frequently described. The various engines have been furnished by the British Thomson-Houston Company, Limited, who have also contracted for the distributing system and the locomotives. It is proposed to have a two-and-a-half minutes service, and the train will consist of seven carriages, which will accommodate 336 passengers. The weight of a train will be 105 tons, exclusive of locomotive. There is only to be one class of car, and that on the American pattern. Between each pair of adjacent stations the line will dip—that is, the stations are nearer the surface than the general part of the railway. The advantage is two-fold; it will reduce the height of the lift shafts, and it will also place the stations so that the incoming trains will have their speed naturally checked, while the starting will be on a down grade. The electricity is conveyed by a third rail, the return current passing through the ordinary rails. The journey over the whole of the new line will take twenty-five minutes, while from Oxford Circus to the Bank the time will be ten minutes. It has been found from observation that the average time of an omnibus from Shepherd's Bush to the Bank is an hour and a quarter.

A new Organ at Trinity Free Church, Pudsey, has been built by Messrs. Abbott and Smith, of Leeds, at a cost of about £1,100.

A new Lancashire Town.—Vickerstown is the result of Messrs. Vickers, Sons and Maxim's energy. This firm has bought several hundreds of acres of land on Walney Island, a large portion of which they are laying out in house property for their workmen, it being contemplated to build from 1,000 to 1,500 houses at once. Contracts have already been let for a large number of these, and new brick-making works have been built, which are now producing between 20,000 and 30,000 bricks per day. Several detached and semi-detached villas are also to be built. A large square—Vickers' Square—has already been planted, 14½ acres of land are to be used as a recreation ground and six acres for gardens and allotments. In connection with the development of Walney Island, a scheme is in the minds of Messrs. Vickers to bring into existence a new watering-place, Walney-on-the-Sea, but the first step they are taking is to find houses for their workmen. There is at present a demand for no less than 2,000 workmen's houses in Barrow, and there is a scarcity of workmen at the large industrial concerns because of the inadequacy of house accommodation in Barrow.

THE PAVING OF CARRIAGE-WAYS.—I.

BY A SURVEYOR.

THE cart-track roads of a century ago disappeared with the advent of the dozen of carriage-way constructors, Macadam and Telford, and the amplification and advancement of the principles established and practised by these progenitors of the modern road-maker, and by Metcalf before them, has led to the evolution of a new science—the science of carriage-way paving. The history of road-making has been fully recounted at different times, and it is not now intended to trace the various stages that have resulted in the present existing systems of road-making, but to confine the limits of these articles to detailing the chief methods of paving carriage-ways now in vogue.

Macadamizing.

The paving of a carriage-way can be accomplished, somewhat primitively it is true, yet simply, by placing on a newly-cut road a layer of ballast from 4in. to 6in. in thickness rolled in with gravel for binding purposes. But it is needless to say that a road so constructed is unsuitable for a district subjected to heavy vehicular traffic. In such a locality, therefore, it becomes imperative that a material harder in substance and of greater resisting power should be sought. One possessing these properties is found in broken granite, and a thoroughfare formed with this is termed in a general manner a macadamized road, after, it is hardly

slipperiness, and homogeneousness in texture stand forth prominently as essential. A material that conforms to these requirements fairly well is Guernsey granite, but when a steep gradient has to be paved, Aberdeen or a similar granite should be used, as it offers a firmer foothold. Aberdeen is rather softer than Guernsey granite, and naturally wears away quicker, but it has the great advantage that it can be taken up and redressed at a very small cost. Of other varieties of granite, all more or less suitable for the paving of carriage-ways, mention may be made of the recently introduced Jersey "Ronez" and the non-slippery "Royal," the former of which is especially useful for wheelers, while the latter is distinguished by the amount of wear it will stand; the fairly coarse Leicestershire stones from Markfield and Mountsorrel; the Norwegian and Newry varieties, which commend themselves on account of their non-slipping properties, the last-named being a desirable granite for steep gradients; and, amongst

of several methods in use for laying these setts is to place them close together upon an inch of "feeding" material composed of six volumes of shingle to one of Portland cement, which is spread on the concrete foundation in a dry state. A mixture of three volumes of sand with one of blue lias lime is next swept into the joints with plenty of water, and the pitching is then rammed with a wooden rammer perfectly solid to the finished level and contour of the carriage-way. After the whole has been allowed to set, a coating or dressing of shingle should be spread on the surface of the road preparatory to allowing vehicles to pass over it. This shingle becomes broken and the pieces penetrate between the joints of the setts, keeping them firm and compact.

There are several modifications of this process, as, for instance, in many metropolitan districts the "feeding" material before mentioned is replaced by fine sand, upon which the setts are closely laid together. Fine shingle or granite chippings are swept into the joints, the sett being rammed to the finished road contour. The pitching is then grouted with a mixture composed of pitch and Stockholm tar, in the proportion of 3 cwt. of pitch to 5 gallons of tar. These ingredients are heated together and poured in a boiling state between the setts. Time is given for the grout to set, and finally the surface of the road is dressed with shingle as before. It is interesting to note that the approaches to the Blackwall Tunnel are paved in this way.

Paving with Wood.

Of course, as it is scarcely necessary to point out, roads constructed on the principles already described present considerable friction to vehicles, and it is on account of the comparative smallness of the friction, combined with considerations of quietness, cleanliness, comfort, and appearance, that wood has found so much favour as a material in road construction. The many specimens of wood that have been used experimentally in the Metropolis and elsewhere include deal, jarrah, karri, stringey bark, blackbutt, red mahogany, and blue gum from Western Australia, engwood from Burma, whitewood and gumwood from South Carolina, and Mora wood from Demerara; so that there has been plenty of variety in ascertaining which was the best kind for street-paving purposes. But no matter which is selected as the most suitable wood, all the soft varieties, before ready for laying, have to undergo a preliminary preserving process. The preservation of the timber used in road-making is of vital importance, and one of the best means of accomplishing this is by what is known as creosoting. The object of creosoting wood is the prevention of the decomposition that arises as the result of (1) the fermentation of the albumenoids contained in the sap, by coagulating them;

FIG. 2

FIG. 1

necessary to state, J. L. Macadam, formerly Road Surveyor to Bristol and one of the first engineers in this country to devote his fine abilities to the study of carriage-way construction. With regard to the macadamizing of roads, the roadway should first be covered with 6in. of hard core, laid to a transverse fall of about 1 in 30, and well punned in. This should be succeeded by a from 4in. to 6in. layer of broken granite spread in an even manner over the carriage-way, well rolled in, again using gravel as a binding material, and liberally watering as the work proceeds. In the rolling of the granite care must be exercised in order that the channels formed on each side of the carriage-way, for the purpose of facilitating the running away of the surface water, are laid at even gradients to fall and discharge towards gulleys. These gradients should not be less than 1 in 150, that is, if composed of macadam, but it is necessary to emphasize the fact that in the case of a macadamized road it is better to have the channels with granite setts or kerbs when a flatter gradient may be used. The foregoing remarks are illustrated by Figs. 1 and 2, which also will show that when granite setts are used in the construction of the channels from three to five courses should be laid longitudinally with the road upon 6in. of concrete; but if kerb is used it should be laid flat upon a similar foundation.

Granite Paving.

A carriage-way constructed in the manner briefly outlined above will answer all purposes for a road which is called upon to carry ordinary traffic, but for one over which heavier traffic has to pass something even more resisting and lasting must be requisitioned. In considering the qualities necessary to a pavement intended for such work, evenness in wearing, absence of

many other kinds, stones from Cornwall, Lancashire, Derbyshire, Ireland, &c.

In paving a carriage-way with granite, some preliminary processes have first to be conducted. For instance, it is obviously necessary that the earth in the carriage-way should first be well rammed, and in the event of there being any soft places, consequent on trenches having been dug for the laying of water mains or sewers, the ground should be removed and replaced by ballast or hard core well rammed in. This being done, a layer of concrete 6in. thick and composed of Portland cement and Thames ballast, in the proportion of six of the former to one of the latter, should be placed on the surface of the ground and laid to the required gradients, the transverse fall being 1 in 30. Fig. 3 illustrates the method of paving a road with granite setts.

With regard to the granite setts in the carriage-ways, these are, as a rule, 3in. wide by 6in. or 7in. deep and from 7in. to 9in. long, laid transversely across the road, while those in the channels, which generally measure 4in. or 5in. wide by 6in. or 7in. deep and 7in. to 9in. in length, are laid longitudinally. One

FIG. 3

(2) the attacks of insects, worms, fungi, &c., by destroying them; and (3) the admission of water into the cells, by replacing it. In its broad principles the process of creosoting consists of first extracting the air and moisture from the tubes of the timber, and then at a pressure of from 50lbs. to 120lbs. per square inch forcing in creosote, a dark-coloured tar distillation product of an oily consistency. This oil, which has considerable antiseptic properties, should be free from bone or mineral oils, ammoniacal water, and a very large proportion of naphthaline, although the latter, when present in moderate quantities, is a desirable constituent, owing to its highly antiseptic qualities. In Bethell's process, which was recently followed through at the works of the Improved Wood Paving Co. Limited, East Greenwich, about 18,000 blocks are placed in an iron cylinder fitted with hemispherical ends, which can be opened during the operations of charging and discharging. A pipe provided with a stop valve connects the cylinder with the adjacent tanks containing the creosote, and the cylinder is also in communication with an air and a pressure pump, the latter obtaining its supply of creosote from the tank and discharging into the creosote cylinder. The timber being in the cylinder and the hemispherical ends closed, the air pump, on being started, withdraws the air from the cylinder and the pores of the wood. After the lapse of an hour the valve in the pipe connecting the bottom of the cylinder and the creosote tank, which has been closed during the exhaustion, is opened, and the atmospheric pressure forces the creosote (which has been maintained at a temperature varying from 80deg. F. to 120deg. F. by suitable means) into the cylinder. When it is full more creosote is pumped in under a pressure of 50lbs. to 120lbs. per square inch. The quantity to be thus introduced, which can be measured by a suitable gauge, is determined by the product of the cubical contents of the charge of timber in feet and the specified quantity of creosote per cubic foot. On stopping the pump the excess of creosote in the cylinder is allowed to pass away into the tank by means of a pressure cock. When the pressure in the cylinder has been diminished, the remaining unabsorbed creosote is drained off through the main valve, after which the charge can be taken out, the amount absorbed verified by weighing a convenient number of blocks, say 100, and the whole carted to the scene of the new roadway. Another process for wood preservation is Boulton's, which in principle differs from Bethell's in that the temperature to which the oils are raised is higher, namely, from 212deg. F., the boiling point of water, to 220deg. F., by which all the water in the timber is expelled in the form of steam. In Blythe's, a third process, "the oils are supplied in a gaseous or finely divided state, and subsequently as a liquid." Then there is also a process of creosoting in an open tank, and several methods the principle of which consists of impregnating the wood with salts of the metals. Notable amongst the latter are:—Boucherie's, in which copper sulphate is the impregnating material; Burnett's, in which diluted zinc chloride solution is employed; and Kyan's, Margary's, and Payne's processes, in which the materials injected are respectively solutions of corrosive sublimate (mercuric chloride), acetate or sulphate of copper, and sulphate of iron followed by zinc sulphate.

Levels and Cross Sections.

Before the blocks can be laid several matters of the greatest importance have to be attended to, one of which is the taking of levels with a dumpy level before the commencement of the work, and the preparation of sections, both longitudinally for the channels and crown of the road and transversely at intervals of 30ft. or 40ft. These should be calculated so as to give a cross fall of 1 in 36, and in this connection it is also important to remember that in no part of the channel should more than 7in. or less than 3in. of kerb be seen, from which it follows that the summits and gulleys must be arranged to allow this. A good formula for defining the cross section of a road is that of Deacon, which is as follows (where A equals

half the width of carriage-ways and R equals the rise to crown, the latter being $\frac{A}{36}$ for wood and $\frac{A}{48}$ for asphalt).

DEACON'S FORMULA

$$R = \frac{36A}{48} \text{ FOR WOOD } \frac{48A}{36} \text{ FOR ASPHALT}$$

$$R^1 = .87 R$$

$$R^2 = .65 R$$

$$R^3 = .35 R$$

Another point that ought to be noted is that the gradients of wood-paved channels should not be less than 1 in 150.

Concrete Foundations and "Floating."

The sections being prepared, the surveyor is in a position to start on the carriage-way. In the event of it being already paved with macadam, it must be broken up, either by driving in steel wedges by hammers or by utilising one of the many excellent scarifiers which road-makers can call into service. The cross sections and channels should now be set out by means of steel pins driven in in such a manner that the tops will represent the level

of the finished surface of the carriage-way. If it is necessary, the hard core or earth beneath the macadam should be removed in order to permit the requisite thickness of concrete to be laid down. The precautions indicated in the case of a road paved with granite pitching, so far as concerns making good all soft places with hard core or concrete, should be equally observed in the making of wood roads. The concrete foundation, which is composed of six parts of Thames ballast to one of Portland cement, should be laid 6in. or 7in. in thickness. This having set, strips of wood, termed "screeds," should be fixed either by nailing on to the concrete direct, or on to pegs driven in to the concrete at distances 10ft. apart. The curves of these screeds should represent the true curvature of the road. Now things are sufficiently advanced for the reception of the "floating" coat, which is made up of a mixture of three parts of Thames sand to one of Portland cement. Its depth should be 1in., and all superfluous "floating" material or mortar should be removed by repeatedly drawing a straight-edge over pairs of screeds. Too much stress cannot be laid on the importance of the "floating" being thoroughly true and even before any attempt is made to adjust the blocks in their final position. It will only be when this has been thoroughly assured that matters will be ripe for placing the blocks.

Block Laying.

Remembering that the blocks must be laid vertically with the grain of the wood, the main features in the method of procedure (which is illustrated by Fig. 4) are to first lay two to four courses longitudinally in the channels, leaving a space of about 1 1/4 in.

between the kerb and the channel blocks, on each side of the thoroughfare, to allow for expansion in the wood. On completion of the carriage-way this space is filled up with clay. The blocks in the remaining portion of the road should be put transversely. As to whether the blocks should have tight joints or a space of 1/4 in. left between each row, engineers differ. If, however, a space is to be provided for, a lath or a strip of wood 1/4 in. in width should be inserted between the rows. Quickness in laying is accomplished by putting the blocks in a dry state ("heading up") on the floated surface of the road. They should then be taken up separately, and the ends and one side of each block dipped into a boiling mixture composed of, tar 5 gall., pitch 3wt., creosote oil 1 gall. These quantities can, of course, be varied so as to obtain a hard, plastic, yet not brittle composition when it sets. When dipping care should be taken that no composition or grout adheres to the bottom of the block, as this will expand and cause an upheaval. Thirty or forty feet of the carriage-way being thus laid, the joints should be grouted up by pouring the boiling mixture on to the surface of the road and raking it into the joints by means of squeegees. Before opening to vehicular traffic, the road should be dressed over with a coating of fine shingle 1/2 in. in thickness; this becomes crushed by the traffic passing over it, and the small sharp particles are pressed into the surface of the wood, making a hardened surface. Some engineers prefer to grout up the blocks with Portland cement grout, but this becomes hard and does

not allow for expansion and contraction in the wood, for it will be found that the blocks will loosen themselves in a little time. In concluding this portion of the subject it remains to be said that at the intersection of roads it is necessary to lay the blocks diagonally.

(To be concluded.)

"Swan" Fountain Pens.—Messrs. Mabie, Todd and Bard, of 93, Cheapside, E.C., resort to a most peculiar, but effective, form of advertising. They send us a copy of "King's New York Views," and intimate that they are willing to send a copy free to any applicant mentioning the BUILDERS' JOURNAL. This offer only lasts, however, while their stock lasts. The publication referred to is of a good size and contains more than a hundred reproductions of buildings in the American capital. It is well worth having.

Liverpool Architectural Society.—In the course of a lecture on "Notes on School Buildings," recently delivered before this society, Mr. E. P. Hind, A.R.I.B.A., said that suitable lighting, thorough ventilation, and warmth without draughts were the leading essentials in school buildings. Attention to small matters was extremely important, and sanitation was as desirable in a school as in a hospital. For the playgrounds asphalt or concrete was suitable, and the necessity for everything being easily kept clean had to be borne in mind, every part or corner where dust and dirt could lodge being carefully avoided. It was most desirable that the plans should be such as would meet the requirements of the next generation, who might have to pay for the buildings. The present tendency was to have small classrooms, especially for infants.

Views and Reviews.

THE GREATEST SOCIAL PROBLEM.

As a writer recently put it in a contemporary when referring to the housing question, "we may spread them out thin or we may pack them over each other's heads." The packing system has been most in vogue up to the present. But, in spite of all systems, the problem of housing the working classes becomes more acute every year—this is just what Lord Shaftesbury said at the time of the Royal Commission, which ended its labours eleven years ago. The little book under review briefly sets forth the various enactments for the better housing of the poor, intersperses a collection of rather wearisome, though appalling, figures, deals shortly with the matters of transit, the clearance of insanitary areas, and land acquisition, defines what the London County Council has done, and concludes with a chapter on "The Reform of Local Taxation," which is the best part of the book. The housing question is so great and has already been the subject of so much deliberation that the main evils and suggestions are now pretty well known by everybody. There seems to be no doubt that the solution of the problem lies in housing the overcrowded population outside and not inside the city. A certain proportion of workers *must* live near their work, but it is estimated that they do not number more than one-fourth; so that if the remaining three-fourths could be taken out to the suburbs quickly and cheaply, the evil would be greatly abated. But, says our author, under the present law, "the inequality of local taxation operates in favour of enterprise in commercial and central districts, and as a hindrance to building and to the development of land in the outskirts." He gives several instances to prove his contention. Take the case of some West End premises. The rent is £1,000 a year, and the building represents an annual value of £150. The site is therefore producing an annual income of £850. The taxes levied (at the rate of 25 per cent.) are £250 a year, or about 30 per cent. on the annual value of the site. Compare this with the case of a small house in an outer district. The rent is £30 per annum, and the building represents an annual value of £25. The site value as paid in ground rent is £5. The taxes, at the same rate as before, are £7 10s., or 150 per cent. on the annual value of the site! In the author's opinion, if site value were substituted for rateable value (not "rateable" as our author spells it) as the measure and basis of local taxation, the inequalities of burden, and the consequent evils, would be removed. This, in his opinion, is where the solution of the problem lies.

"The Housing Question." By Alfred Smith, L.C.C. London: Swan Sonnenschein and Co., Ltd., Paternoster Square. 1s.

HYDRAULIC RAMS.

This book forms one of a series of technical manuals dealing with various subjects. The writer deals with the subject in a very practical manner, and any person requiring information on the best method of fixing and working hydraulic rams will find this book of some value. All the little difficulties, such as air in the pipes, solid matter getting under the valves, pipes fouling, &c., are dealt with at some length. The author points out the necessity of straight-way stop valves, smooth-bore drive pipes and the absence of sharp bends, shoulders, and other obstructions in the drive pipe; and those who wish to get the best results from their ram will do well to carefully note these pages. We disagree with the author, however, when he suggests that bends in the drive pipe make very little difference. We think that if careful tests were made there would be found a considerable loss by friction and in the impact of the water springing the bent pipe further out of the straight. The result of a number of experiments with a model ram are given, all of which will be especially useful to the student. Theoretical considerations bear out the

author's statement that a long drive pipe gives a more powerful impulse than a short one, as the weight of the water, multiplied by the speed at which it is moving, gives the measure of power stored up for the impulse. Dealing with the question of the reversal or rebound of the water in the drive pipe on the dash-valve closing, we, of course, agree with the author that some water slips back past the delivery-valve before it has time to close, as in pump valves; but we also think that the small quantity of air which the water contains gives some elasticity to the otherwise practically incompressible fluid; and this helps the backward flow, and probably the pipes slightly expand with the shock and then immediately contracting further help it. The author describes and illustrates a few examples of the numerous patented rams, and the student can by this gain much useful knowledge. And we may here remark that the illustrations are all very good and clearly illustrate the text. In discussing the difficulty of keeping the air vessels charged with air, several valves are illustrated and described; but, speaking for ourselves, we have never found any of these automatic devices answer very well, and we prefer to fix air and drain cocks, with a stop-cock on the delivery-pipe to save emptying that when we recharge the vessel with air. But, as the writer points out, what is successful in one case may fail in another. Some good examples of pumping rams are given, and by the aid of the diagrams the student cannot fail to properly understand the principles involved in the general construction of these machines. In the concluding pages the author gives much useful information, the result of his practical experience in erecting, repairing, and altering defective rams. The book, altogether, is a very useful one, and is well worth the attention of not only the student, but of the practical engineer engaged in this branch of hydraulics.

"Hydraulic Rams: their Principles and Construction." By J. Wright Clarke. London: B. T. Batsford, 94, High Holborn. Price 2s.

HOUSE SANITATION.

House drainage—like the poor—is always with us, so that it seems only natural to expect a continual stream of literature (good, bad, and indifferent) bearing upon a subject of such importance to civilised communities. The medical and engineering professions, especially, have made most praiseworthy endeavours to secure a very high standard of sanitary efficiency for habitable buildings; with the result that this particular field of sanitary science has apparently been discussed and written upon from every conceivable standpoint. Perhaps some genius may yet arise, who, by patient and original research, will be capable of more or less revolutionising the existing methods of house drainage; but until that time arrives, a very considerable proportion of what has been, and is being, written upon this subject is nothing more than a reiteration of generally accepted principles and methods of construction.

This book consists chiefly of a series of articles recently contributed to "The Sanitary Record," and now issued in a collected form. A careful perusal of its contents reveals nothing of importance that is new, whilst there is much that is an obvious following of other well-known text-books upon the same subject. The author has, however, compiled a convenient and readable volume which will be very helpful in placing the orthodox methods of house drainage in a concise manner before students and others requiring information relating to ordinary drainage work.

The first part of the book deals with the general arrangement and laying of drains. The importance of proper drain ventilation and disconnection is also rightly insisted upon. The various forms of stoneware, iron, and lead pipes, joints, traps, inspection chambers, etc., are fully described and illustrated. Typical drainage plans for a large and small villa residence, respectively, are given, on which suitable positions for the necessary surface gulleys, inspection chambers, soil and vent pipes, fresh-air inlets, and disconnecting chambers are clearly indicated. It would

have added considerably to the usefulness of this portion of the work if the drainage plan for a large town house had also been included, for it is in such buildings that the greatest difficulties occur in the convenient and satisfactory arrangement of drains, together with their fittings.

As a matter of detail, exception may be taken to the small size (2ft. by 1ft. 6in.) laid down for shallow manholes. Such small chambers are inadequate for the proper reception of, say, two branch drains on each side of the central or main channel, nor do they afford proper facilities for inspection and clearing purposes. The method of construction recommended for drains with considerable fall, and illustrated in Fig. 146, possesses several serious drawbacks, for which any slight advantage gained by increased initial velocity of sewage flow scarcely offers sufficient compensation.

Various sanitary fittings are described and illustrated. The concluding chapter on drain testing contains some practical hints respecting the method of testing new drains by the water, pneumatic, and smoke tests. The book is produced in an excellent style, well printed, well bound, and forms a very neat volume.

"House Drainage and Sanitary Fittings." By G. J. G. Jenson, C.E. London: The Sanitary Publishing Co., Limited, 5, Fetter Lane. Price 5s. net.

Correspondence.

Ellipse by Compasses.

To the Editor of THE BUILDERS' JOURNAL.

ELGIN ROAD, CROYDON.

SIR,—Referring to the correspondence in your journal for some time past on this subject, I take the liberty of offering my views as follows:—(1) A true elliptical curve being no part of a circle, but a continually changing curve, cannot be struck with compasses or from centres. (2) It appears to my mind a pity to introduce a wrong and complicated method of describing this beautiful

curve from centres, when the right way to do it is so simple and so easily understood by any intelligent carpenter or joiner, namely, the trammel system (see accompanying sketch). (3) As an architect I have always adopted this system, and there cannot be a more truthful or more simple method adopted for describing the curve either by the draughtsman or the carpenter. Of course, in an $\frac{1}{8}$ in. scale drawing of an elliptical curve I use the compasses, striking from three centres, which is the best way for so small a scale, but in $\frac{1}{2}$ in. or larger scale details I adopt the trammel system, by making sufficient points in the curve with a straight narrow strip of drawing paper, as a trammel rod, and then drawing the curved line through these points. The carpenter or joiner can easily follow such details, and the result is a true elliptical curve instead of a crippled one, which is always the case if the curve is struck from centres.—

Yours truly,

B. McClymont.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Sir, he made a chimney in my father's house, and the bricks are alive at this day to testify it."

—SHAKESPEARE.

Our Inset Sheets.

THE Spanish ironwork illustrations are dealt with in Mr. Jackson's article, which commences on page 163 of the present issue. The house at Luton Hoo (Mr. Louis Ambler, A.R.I.B.A., architect) is faced with red brick up to the first floor level (including the chimneys), and the upper part is of half-timber work, the wood being fir, coated with Stockholm tar. All the other woodwork, both external and internal, is painted white, except the outside doors, which are green, and the servants' offices, which are brown. The roofs are covered with local red tiles. Mr. S. Foster, of Kempston, near Bedford, was the builder, and Mr. D. Davies was the clerk of works. Mr. Frederick Ernest Williams, of London, W.C., is the architect for the house at Hartfield, Sussex, belonging to H. B. H. Turner, Esq., C.I.E. The house is built of purple-grey Crowborough bricks with red quoins, and the stone used for dressings, &c., is local sandstone, with bright red tiles for the roof. The general contractor was Mr. Charles Day, of Cowden, Kent.

Dublin's Ancient Gates.

THE Queen's visit adds fresh interest to everything connected with Ireland, and the delivery to Her Majesty of the keys of the city gate at Lesson Street Bridge, Dublin, makes it worth while to give a short account of the several portals which were built into the walls of old Dublin. It is generally admitted that the walls and gates were erected by the Danes, and when Melaghlin marched against the city in the year 1000 the strong masonry baffled all attempts of the besieging force to effect an entrance. In 1316, in anticipation of a siege by Edward Bruce of Scotland, the walls of Dublin were strengthened and enlarged on the northern portion above Merchant's Quay. Here a tower formerly stood, a little distance beyond the gate, while there was another gate in the street "where the taverns are." That is the locality now called Winetavern Street, leading up a steep hill, crowned by the cathedral of Christ Church. The historian enables us to form some approximate idea as to the exact circuit of the ancient walls of Dublin, that is, from the Winetavern gate along the south side of Cook Street till they joined Owen's Arch, now St. Audoen's Arch. This latter structure was one of the portals into the city, and from thence the walls were continued north of Owen's churchyard to Fagan's Castle in Page's Court, where there was another portal, and thence on to Newgate. The walls of the city, including those of Dublin Castle, did not in their widest compass occupy the length of an Irish mile. Dames' Gate, originally styled the Eastern Gate, and St. Mary's Gate, did not derive its name from the mill-dam near it, but from the Church of St. Mary les Dames. During the reign of Charles the Second the slough in the neighbourhood of Crane Lane was reclaimed, the Liffey embanked with quays, the council chamber of the Lord Lieutenant built there, and another aperture made in the city wall, while in 1675 Izod's Tower was taken down and a new entrance made—the Essex Gate.

The Course of the Wall.

FROM Izod's Tower the wall of Dublin took a N.N.W. direction till it joined Newman's (by some termed Buttevant's) Tower, on the banks of the Liffey, a little west of Essex Bridge, and a little further on was Case's Tower, subsequently known as the Baker's Hall. The city wall stretched in a direct line along Merchant's Quay. It joined the Bridge Gate near the Old Bridge, built in the reign of King John, which gave its name to what archaeologists consider to be one of the oldest streets in the metropolis of Ireland. The Bridge Gate was placed

between two turrets and ornamented with a public clock in 1573, suggested by the example of Queen Elizabeth. From this the wall was continued on the south side of Bridge Street and extended up a steep hill to New Gate, whence the wall was carried south-east along the rear of Back Lane to another aperture called St. Nicholas' Gate, where was also St. Francis' Tower, opposite the precincts of the priory of that Order. From St. Nicholas' Gate the wall went to St. Werburgh's Gate, where the only piece of the old wall of Dublin that remains now may be seen beside Hoye's Court, where Dean Swift was born. From the pole-gate the wall stretched in almost a straight line till it terminated with Dublin Castle at the Birmingham Tower.

Hanging Bridge, Manchester.

THE proposal to remove this ancient work from its present locality is causing a good deal of local uneasiness. A correspondent to the "Manchester Guardian" says: "In May, 1882, I visited the spot and caused a careful drawing to be made of the archway then exposed, stone for stone. A few days later and the opportunity was gone. Should this drawing be of any service at the present time to antiquarians or to the authorities I should be pleased to lend it upon any reasonable conditions as to its safety. . . . Why should these ancient relics be divorced from their original habitat? Could not the very capable cathedral architect or the skilful designer of "Old Manchester" be permitted to suggest some method, either by excavation, fencing round, or otherwise, of retaining Hanging Bridge *in situ*? Of our old cathedral not a single original stone remains. The few that I know—mostly gargoyles—are in the gardens of the Royal Botanical Society at Old Trafford. We have distributed St. Mary's Church to the four winds of heaven. . . . But what have we gained by such ruthless spoliation? Nothing but a few square yards of open space. . . . How many British subjects know the whereabouts of Temple Bar? Yet had it been re-erected in the Temple Gardens, where there is still room, millions would have seen it since it left its historic home; or, better still, a little ingenuity would have retained it in its original position by adapting the ancient roadway as the modern footpath, and completing the archway with a buttress or monumental tower. Why should we, therefore, take up Hanging Bridge, the very gate and threshold of our city, and cast it—disguise it as we may—into what would practically become, so uncongenial would be its surroundings, the potters' fields of Birch? Another correspondent says: "What should we think of York removing its walls to a field or park outside the city, or if Berwick carted away its picturesque walls by the Tweed? Or, turning westward, would anyone dare to transplant the venerable walls and towers of Carnarvon, Chester, or Conway? While Manchester remains disfigured by three or four of the most hideous churches man ever built in the last two centuries, let us at least be allowed to keep the "Hanging Bridge" of men who built with beauty as well as with durability."

Landscapes at the Academy.

IN summarising the work which has been done this year by the artists who are not members of the Royal Academy, says the "Globe," a place of some importance must be given to landscape. The pictures of this class are fairly numerous and decidedly interesting. They represent a sufficient variety in the convictions of the workers, and prove that there is no lack of enterprise among the painters of the open air, and no hesitation to attempt big undertakings. Mr. Yeend King, for instance, has one of the strongest pictures that he has ever painted, "The Avon by Bredon Hill," a splendidly brilliant rendering of sunny colour and subtle atmosphere. His other canvases, "The Fold Yard" and "The Duck Pond," are not on so large a scale, but are not less excellent in technical accomplishment. Mr. Mark Fisher, too, is seen quite at his best in a large study of summer sunlight, painted with

admirable certainty and yet with sensitive refinement. Mr. Edward Stott continues to work the same vein of pastoral romance from which he has already gained admirable results. Mr. Alfred Hartley's chief pictures are also pastorals. Mr. J. Buxton Knight sees nature on a larger scale. He has completed a delightful picture of a river valley with a stream winding through rich meadows and lighted by the last rays of the setting sun, a robust and masculine work worthy of all praise; and he has, as well, a finely composed view of Magdalen College, Oxford, that is full of originality and artistic perception. Mr. J. L. Pickering has varied his methods and has painted, in addition to several pure landscapes, a very impressive representation of a great foundry. Mr. J. Coutts Michie, though he has been lately much occupied with portraits, has ready for exhibition two open-air subjects, while Mr. R. Vicat Cole has a big woodland scene, a glade carpeted with hyacinths, that he calls "Spring's Delights," and a slightly smaller work, "Haytime in Wharfedale." Mr. F. Foottett, one of the few artists who uses landscape as a basis for fanciful and symbolical design, has carried out his aesthetic theories in several important pictures; and Mr. R. Onslow Ford, who, young as he is, well deserves to be reckoned among the best followers of the naturalistic school, has in two or three canvases made a very definite assertion of his sound insight into refinements of pictorial practice. Among other landscapes that must be noted are Mr. A. S. Hartrick's rustic scene, "The Wassail Bowl"; Mrs. Hartrick's paintings of a farmyard in winter time, and of a tree-shaded pool, thickly overgrown with tall water-plants; Mr. Lindsay Macarthur's subjects in the Cotswood Hills; and the works by Mr. H. Hughes Stanton, Mr. N. M. Lund, Mr. Clayton Adams, Mr. R. W. Allan, and Mr. Moffat Lindner.

Remodelling a Town Church.

BLACKBURN, whose ancient parish church was taken down early in the present century to make way for the present cathedral-like buildings—one of the earliest examples of the Gothic revival—possesses like its sister town, Preston, no ecclesiastical structure dating from pre-Reformation times. The oldest church in the town, St. John's, at the northern side of the market-place, was dedicated in 1788, and is a commodious building in the Classic style. Formerly a proprietary chapel, it is now a handsome parish church. Some five or six years ago the church was decorated and the structure strengthened at considerable cost, and this week will see the completion of a further scheme of improvement, which practically transforms the interior appearance of the building. A much-needed chancel, enlarged choir, and vestries are the main features, and a new and costly organ is subsequently to be added. St. John's is now really a model town church, whose interior reminds you in almost every detail of Wren's more famous city churches. The added portions are in keeping with the rest of the fabric as to style, which is described in Whitaker as Venetian. The new details, however, are more ornate. The chancel is revealed by a bold and lofty arch, of great dignity, and with classic mouldings of the Corinthian order, supported by fluted columns with suitable entablatures. Two stained-glass windows give light to the sanctuary. The large central window shows in the main light the Crucifixion, and in the two side lights the Resurrection and Ascension. The colours are rich but subdued, the figures unconventional, and the details Renaissance in subject and form. A three-light side window shows a representation, *Nunc Dimittis*, with the Good Shepherd, and Christ, the Light of the World, the latter a replica of Holman Hunt's famous painting now in Keble College Chapel. The windows are by Messrs. Seward and Co., of Lancaster. The east window is a private donation, but the southern window is the gift of Mrs. Embley, of Blackburn, in memory of her husband. A new oak reredos, of bold design, is a great feature. The panels in this are in mosaic work. Mr. Dresden is the architect.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

R.I.P.A. Preliminary Examination Papers.

MARLBOROUGH.—INQUISITIVE writes: "Is there any book published giving the examination papers of the Preliminary R.I.B.A.; or are any printed for, say, the past five years, without having to obtain the Kalendar for each year?"

Our correspondent can obtain the information he desires only in the R.I.B.A. Kalendars.

Builders' Book-keeping.

LEEK.—J. C. S. writes: "Can you kindly tell me if there is a really good book that specially gives information for keeping a set of books for a builder and contractor's business in an up-to-date manner?"

The only book on builders' book-keeping is that by Mr. Saker ("Builders' Book-keeping: A Perfected System.") The price is 3s. 6d.

Answers in Honours Building Construction.

PLYMOUTH.—STUDENT writes: "Could you tell me where I might obtain the answers to the questions set in Honours Building Construction, and the price of them for about six years?"

The only published solutions to Honours Building Construction questions of recent years are those in the "Building World," Nos. 35, 37, 39, 93, 97, 99, 143, 145, 147, 199, 201, 203, 205, 207, 209, 212, 215, 219, 224, 229, published by Cassell and Co., La Belle Sauvage, London, E.C. HENRY ADAMS.

Cost of Workhouse Pavilions.

MIDDLEWICH, CHESHIRE.—STUDENT writes: "What is the usual cost per cube foot for workhouse pavilions, i.e., in cubing them up? Does the cube price usually include the heating, ventilating, electric lighting, &c., or is it customary to add these in addition to the price per cubic foot? Any other particulars respecting cubing will oblige."

The cost of workhouses varies from about 6d. to 8d. per foot cube, exclusive of special sub-contracts after completion of structure, or say £50 or £60 per inmate. St. Thomas' Hospital, in London, built on the pavilion system, is reported to have cost 9d. per foot cube, or £250 per inmate.

HENRY ADAMS.

Skew Arches.

TROWBRIDGE.—YOUNG ENQUIRER writes: "I should like to know how to develop the soffit of a skew arch in masonry work."

The development of a skew arch in masonry is rather a large piece of work, and should be approached by graduated study. The following works may be consulted:—"A Practical Treatise on Oblique Arches," by J. Hart (Crosby Lookwood and Son, 7, Stationers' Hall Court, London, E.C., 3s.); "Skew Arches," by Prof. E. W. Hyde (2s.); "A Practical Treatise on Segmental and Elliptical Oblique or Skew Arches"; "The Principles and Details of Construction in Simple Terms" (21s. net); "A Treatise on Constructing Oblique Arches with Spiral Courses," by W. Donaldson (4s., E. and F. N. Spon, 125, Strand, London, W.C.).

HENRY ADAMS.

Iron Skylight.

RAVENSCOURT PARK, W.—ROWTON writes: "Will you please give details for an iron skylight in a corrugated-iron roof, the sheets being supported on purlins of angle-irons 5ft.

apart, roof slope 1 in 10. No boarding is to be used under the corrugated iron, and all the lead flashings should be shown."

The size and shape of skylight are not given, and the slope of 1 in 10 is too flat for a satisfactory corrugated iron roof. These roofs are usually curved, although not necessarily so, and the skylights are circular, 3ft. to 5ft. diameter placed along the middle, say, 12ft. 6in. centre to centre. Being placed on the highest part and shaped to the curve of roof they need no flashing.

HENRY ADAMS.

Books on Sanitary Engineering, &c.

CARDIFF.—A CONSTANT READER writes: "I desire to sit as a candidate for the Municipal and County Engineers examination and to extend my knowledge of general engineering from that of a small office. Would you name some good practical books that I could obtain to help me in sanitary engineering, water supply and service and road-making. The ones that I am able to obtain are very old editions and not at all up-to-date."

The best books to obtain would be "Modern House Construction" (Blackie, 48s.) and "Specification, No. 4," (these offices, 5s.). Both of these are exhaustive, and the former, though expensive, is well worth its cost, containing numerous well-drawn illustrations and dealing almost entirely with sanitary work and water supply. G. A. T. M.

Roof Rafters and Attic Joists.

ST. ANDREWS.—W. W. C. writes: "Could you publish a sketch showing the best way to rest the rafters of an eaves-projecting roof on attic joists which serve as ties to the roof? The joists are 9in. by 3in., and the rafters

RAFTERS AND ATTIC JOISTS.

6½in. by 2½in., both at 18in. centres; no principals are used, and the pitch of the roof is about 35 degrees."

The accompanying illustration shows both rafters and attic joists coggled to wall plate, and themselves pinned together with hardwood pins. This method of construction ought to meet the case. G. A. T. M.

Determining Relative Cost of Materials in Buildings.

SCARBOROUGH.—J. R. writes: "If the total amount of wages for all trades in building a good ordinary house amount to (say) £500, is there any rule by which the relative cost of materials in building such a house can be determined?"

In some trades, such as bricklayer and mason, the cost of material far exceeds the cost of labour; in others, such as joiner and plumber, they are about equal; and in others, such as painter, the cost of labour is the greater. Taken as a whole, it will generally be found that out of every shilling spent upon a dwelling house, 5d. is for labour and 7d. for materials, including builder's profit in both these amounts. This is a rough approximation only, and would vary according to the materials used and the district in which the house was built; but as a general rule one would expect materials to cost about £700 for a house upon which the wages bill amounted to £500. G. A. T. M.

Books on Working-Class Cottages, &c.

LIVERPOOL.—B. E. E. writes: "Which is the best and cheapest book dealing fully with cottages for the working classes and the drains that are necessary for such houses to ensure perfect sanitary arrangement? Plates showing this are desirable. Is there a book published giving the by-laws and regulations of every town, suitable for an architect's reference when submitting plans for a district he is not acquainted with? Which is the best book for estimating the cost of a building?"

"Houses for the Working Classes in Urban Districts," by S. W. Cranfield and H. I. Potter, Associates R.I.B.A. (price 15s. net, post free), will doubtless meet our correspondent's requirements. As far as we are aware no book has ever been published giving the by-laws and regulations of all the towns in the kingdom. A good book on estimating is "Estimating," by George Stephenson, price 5s. 6d. (The books mentioned can be obtained from B. T. Batsford, 94, High Holborn, W.C.).

Public Hall.

BLACKROCK, CO. DUBLIN.—E. C. J. writes: "I should be glad to know the cheapest and simplest form of wooden floor joist for a 30ft. span between the walls, which are more than 2ft. 6in. thick and of stone. What bearing would be required on each side, and which would be the simplest roof principal for the same span? Also, what would be the accommodation of a hall 30ft. by 40ft., and which is the simplest form of gallery that could be erected at the end of it? What space is allowed per person for seating accommodation?"

A wooden floor-joist would not be suitable for the floor of a public room 30ft. span. The greatest span for 11 by 3 fir joists 1ft. apart is 22ft. in a private house, or 15ft. in a public building. For a span of 30ft. rolled joists should be used, say, 18lbs. by 7lbs. by 75lbs. and 10ft. apart with a bearing of not less than 14in. on a good stone template. The roof should be formed of queen-post trusses 6in. thick and 10ft. apart. Allowing for a small platform and narrow gangways, a room 30ft. by 40ft. would hold a maximum of 240 persons seated, allowing a gross area of 5 square feet for each. The gallery might be formed with a similar rolled joist at front, carrying fir joists on the slope. HENRY ADAMS.

Laying a Dancing Floor.

LONDON, W.C.—J. H. writes: "I should feel obliged if you could give me your advice as to the best method of laying a floor for the purpose of dancing on so as to get a good spring. I enclose tracings (not reproduced) showing position of proposed floor, which is partly constructed of 9in. by 2½in. joists laid on 12in. by 12in. beams, there being a 6in. column underneath the centre of each beam. Would you advise laying another floor on above on carriage springs, or is there some method of vulcanite floors?"

Probably the best thing to do, preserving the present height of the room or nearly so, would be to remove the joists, so far as they are already laid, and refix them with a helical spring in a closed oil-containing cylinder under each where it rests upon the main beam. Of course the wall plates must not be bedded in the walls, as joists and floor must be free to spring. The springs would most likely have to be specially made, and one of the manufacturers of patent door-springs might be consulted with advantage. The joists should be scarfed and strapped at all heading joints. G. A. T. M.

Liability for Defective Roof.

CROUCH HILL, N.—J. D. S. writes: "About four years ago I was architect for a warehouse having a concrete and asphalt roof. Before the building was finished the asphalt cracked owing, in my opinion, to want of elasticity, and I called on the contractor to take it up and relay it. This he did and gave a guarantee for five years to make good any defects from bad workmanship or materials. The asphalt has

again cracked from the same cause and let in the water to the damage of my client's stock; the contractor is again willing to relay the asphalt. Under the circumstances, am I, as architect, in any way liable to my client? He informs me, on advice, that I am liable."

The answer to this question must depend on whether our correspondent has been guilty of any want of care or skill in the matter. If, for example, he has allowed asphalt of inferior or unsuitable quality to be used in the work, although by the exercise of reasonable skill and care he could have ascertained that fact, he will be liable. Or, again, if no asphalt would be suitable in such a position, and yet he ignorantly or carelessly designed a building in which asphalt was to be used, then he would be liable.

H. P. B.

Cast-Iron Stanchions.

KIRKCALDY.—CRONJE writes: "(1) What practical formula is there for ascertaining how to design a cast-iron stanchion as shown in sketch (not reproduced) to carry a given weight, the whole space from top to bottom between the back and front supports to be open? (2) How is the strength affected if two intermediate stiffeners or stays are introduced, say 4in. by 1½in. (3) Show by the formula what weight the stanchion as sketched would carry, and how the formula would reverse to find the section."

In any case of this kind it is necessary to consider the length and the least width of the unsupported portions. For instance, with the stanchion shown, consisting of an open cast-iron frame 11ft. high, 2ft. wide, and sides formed of 4in. by 3in. by 1½in. T-section, the length will be 11ft. and the least width 3in.; the strength will be determined by Gordon's formula, and, if loaded uniformly, half the load may be taken as carried by each side. In this case no additional strength would be gained by bracing the two sides, because the least width would remain unaltered. Gordon's formula, applicable to cast-iron T-section, is as follows:—

Breaking weight in tons = $\frac{36 S}{1 + \frac{l^2}{a d^2}}$
 where S = sectional area of metal in inches;
 l = length in inches; d = least width of section in inches; and a = 1500.

HENRY ADAMS.

Elizabethan, Queen Anne and Jacobean Architecture.

GRAVESEND.—VESWOR writes: "In your answer to my query relating to Elizabethan, Queen Anne and Jacobean styles of architecture (see page 97 of issue for March 14th) you refer me to the R.I.B.A. prize essay and to the folio works of Mr. J. A. Gutch and Messrs. Belcher and Macartney. Both of these sources are entirely out of my reach. I append a list (not reproduced) of buildings which I have placed under the heads of which I believe them to be characteristic. Illustrations of these works have recently appeared in the 'Architectural Review.' If they are not under proper heads will you kindly rearrange them for me. Will you also mention a few examples of the Jacobean period."

Were it not for the pity of it, this query would raise a smile. Our correspondent has evidently confounded the modern works of living men in the so-called Elizabethan, Jacobean and Queen Anne styles with the buildings actually erected in the sixteenth, seventeenth, and eighteenth centuries; apparently through confining his reading to a modern review without a basic knowledge of architectural history. With considerable regret we feel obliged to advise him to begin at the beginning, and to read such works as Hamlin's "History of Architecture" and Sturgis's "European Architecture," following these with Anderson's "Italian Renaissance"—and all this before specialising in the peculiar and somewhat debased English varieties of the Renaissance which he enquires about. These three books are neither of them expensive and might be purchased in the order named.

G. A. T. M.

Safe Load on Piers.

LEEDS.—LEEDS writes: "I should be glad to know what is the safe working load for piers of (1) ordinary bricks (say Flitton) in mortar, (2) pressed bricks in mortar, (3) pressed bricks in cement, (4) hard sandstone in cement, (5) granite. The authorities differ so much on some points."

The following is a complete table of the loads used in my practice:

	Tons per foot super.	
Granite...	15 = $\frac{1}{20}$ fracture load.	
Portland and compact Limestone ...	15 = $\frac{1}{15}$ "	
Sandstone ...	12 = $\frac{1}{10}$ "	

And with stone template interposed:—

Blue brick in cement...	9 = $\frac{1}{8}$ fracture load.
Stock brick in cement	6 = $\frac{1}{5}$ "
Stock brick in lias mortar ...	5 = $\frac{1}{4}$ "
Stock brick in grey lime mortar...	4 = $\frac{1}{3}$ "

And below the brickwork:—

Cement concrete ...	4 = $\frac{1}{8}$ fracture load.
Lime concrete ...	2 = $\frac{1}{5}$ "
Gravel and natural compact earth ...	2
Made ground rammed in layers ...	1

In architectural work, with dead loads only, these figures are often increased, say up to 50 per cent as a maximum, but for railway work for engines weighing from 40 to 50 tons and running at 60 miles per hour the factor of safety is not too great, considering the difficulty of bedding truly and the irregularity of the mortar joints.

HENRY ADAMS.

Architectural Practice in South Africa.

MILNSBRIDGE, NEAR HUDDERSFIELD.—YORK writes: "Can you give an architect, surveyor and estate agent an idea as to the best methods of procuring a practice or situation in South Africa—wages, prospects, and locality, and class of work required?"

I would refer "York" to my paper on South Africa in the Royal Institute Journal, and to the extensive report of my lecture on "Johannesburg before and after the war," in the BUILDERS' JOURNAL for March 7th last. I have there said all there is to say about "prospects." Wages to assistants have been high—nearly double in the Transvaal to those at home—but I should judge that a general access of settled prosperity would reduce these. As to "locality," a man should go where he can command influence, even more indispensable out there than at home. There are no recognised methods of obtaining work in South Africa that do not apply equally at home. See the copy books for many excellent maxims about industry, sobriety, &c. A man can only book his passage, go out, and begin pushing himself for all he is worth in the directions best suited to his attainments—social and professional. For the "class of work required," I should say that the man likely to succeed in South Africa is he who can "turn his hand to anything," and therefore he must be ready to tackle all classes of work. But especially he must be strong on the business side of his profession, and have a keen faculty for acquiring a knowledge of prices, and a happy knack of working within his estimates. He should also be able to make shift in the use of what materials come to his hand. Estate agency is no more incompatible with the practice of the architectural profession out there than at home, but as a general rule they are not found in combination. Estate agency is very frequently combined with auctioneering, and I should think "York" would find it too bustling a calling and too keenly borne in upon by competition—as practised, at any rate, in Johannesburg—to be successfully taken up along with the more sedentary occupation of an architect.

JOHN BEGG, A.R.I.B.A.

Masters and Men.

The Blackpool Painters have struck for an ½d. per hour increase. About 300 men are affected.

The Huddersfield Plasterers have agreed to accept the masters' offer of ½d. per hour advance in lieu of the 1d. they originally demanded.

The Dumfermline Operative Painters have struck for an advance in wages from 8d. to 8½d. per hour, and certain concessions in regard to country work.

The Hereford Labourers, who recently demanded 1d. per hour increase, have accepted the employers' offer of ¾d. advance from April 2nd and ¾d. on July 2nd.

The Edinburgh and Leith Master Joiners still adhere to their notice given in January to reduce the men's wages from 9½d. to 8½d. on the 15th inst.

A Section of the Arbroath Joiners, to the number of about twenty, struck last week against a proposal by the masters to reduce their wages from 8d. to 7½d. per hour.

The Taunton Carpenters and Bricklayers to the number of nearly 300 have struck for an advance in wages from 6d. to 7d. per hour. The masters are willing to grant fewer working hours.

The Liverpool Joiners have been locked out to the extent of 50 per cent. owing to a dispute arising out of the laying of wooden blocks for flooring. Unless the dispute is settled in the meantime, the remainder will be locked out on Saturday next.

Strikes at Tamworth.—The bricklayers of Tamworth and district have struck for an advance of 1d. per hour on their present wage of 8d. About sixty men are affected. The labourers have applied for an advance of ½d. per hour on their wage of 5½d., and the notice will expire in a week. The painters have struck for an advance of ½d. per hour.

The Colchester Bricklayers to the number of about 200 have struck for an advance in wages. About six months ago they demanded an increase of 1d. per hour on their then existing wage of 6½d., but agreed to accept the masters' offer of ¾d. It is not clear now whether the men want 1d. increase on the 6½d., making 7½d., or on the 7d., making 8d. per hour.

Labour Market in the Colonies.—The April circulars of the Emigrants' Information Office, 31, Broadway, Westminster, S.W., report that in New South Wales there has latterly been a burst of activity in the building and allied industries. Queensland reports an increasing demand for mechanics, except at Mackay and Charters Towers. New Zealand reports plenty of work; the building and engineering trades being especially busy in Auckland, Napier, Greymouth, Christchurch, Dunedin and Invercargill.

Painters' Wages Dispute at Perth Station.—Sheriff Fyfe, who was appointed arbitrator by the Glasgow Master Painters' Association and the Glasgow District of the Amalgamated Society of Operative Painters, has decided that the wages paid by Messrs. A. and J. Scott to local men taken on at Perth (viz., 9d. per hour) are fair and reasonable, and are in terms of the agreement betwixt the parties for the year 1900. It will be recollected that Messrs. Scott were paying 10d. per hour to the men on the job who were taken by them from Glasgow, and 9d. per hour to the local men employed at Perth. The Operative Society contended that the latter should also be paid 10d. per hour, but Sheriff Fyfe's decision upholds the contention of the masters that, in terms of the agreement for the year, Messrs. Scott were only bound to pay the local men the Glasgow rate—viz., 9d. per hour.

A new Hospital at North Berwick has been built from the designs of Mr. G. Morham, architect, of Edinburgh. It comprises two ward blocks and has cost £2,563.

Professional Practice.

Belfast.—The principal entrance of the Bank Buildings was thrown open for business last week, after the rebuilding of the front section of the premises. The work was commenced about eighteen months ago. The architect is Mr. W. H. Lynn, and the contractors are Messrs. James Henry and Sons. As the entire section to be rebuilt could not be handed over at once to the contractors without seriously interfering with the business, it was decided to do the work in two parts. The first and most complicated of these is now finished, and the second and final portion will be proceeded with immediately. Pedestals to piers and plinths under shop windows are of polished black granite. The piers are of polished

erected in Castle Street by the same architect and contractors. In front, the building is terminated by a balustrade and chimneys, one at each angle, with central dormer for clock, and is further ornamented by two copper figures representing winged cherubs supporting the Imperial crown. There is also a dormer in Castle Street, and one in Royal Avenue. The slates are green Westmorland, and the height of the building from pavement to clock is more than 100ft.; the width of the building in front is 74ft.; and the extreme depth from front to rear, when complete, about 350ft. An electric clock replaces the old "Bank Buildings Clock."

Brierley Hill.—The Church of St. Michael has been re-opened after extensive restorations and improvements, which have cost £5,000.

Chislehurst, Kent.—“Bullers Wood,” illustrated on this page, was designed by Mr. Ernest Newton for J. Sanderson, Esq. The builders were Messrs. Arnaud and Son, of Bromley, Kent. The materials used are hand-made red bricks and tiles, and the date of the building is 1889. Our drawing was made by Mr. W. R. Lethaby.

Liskeard.—The tower of Liskeard Parish Church having become insecure, it was decided some time ago to re-build it, and a competition was started in which Mr. John Sansom, architect, of Liskeard, was successful. His design, however, failed to receive the sanction of the diocesan authorities, as differing too widely from the whole structure, and in order to meet their views the tower was reduced in size, the pinnacles at the summit

"BULLERS WOOD," CHISLEHURST, KENT. ERNEST NEWTON, ARCHITECT.

granite of a rich chocolate colour in 12in. courses, channel jointed, with moulded caps and necking on top. The architrave, frieze, and cornice of first and second floors, and also the piers of the first floor, are constructed of the same material, highly moulded and polished. One of the most striking features in the front of the building is an arched doorway, rising two storeys, having pierced spandrels filled with clear glass. The entrance door and sashes are of Spanish mahogany, and the carved panelled ceiling is of polished teak, the extent and richness of which gives a peculiarly lofty appearance to the entrance. From the second floor cornice spring six Corinthian columns, 23ft. high, the bases and caps of which are of red sandstone and the shafts of polished granite, each shaft weighing seven tons. These shafts support the main entablature of the building. From the second floor, with the exception of the polished columns, the building is constructed of red sandstone, which harmonises with the extensive buildings previously

The original church was founded in the early years of George the Third's reign, and was established as a chapel-of-ease to the parish church of Kingswinford. At that time the needs of the neighbourhood were small, for fifty seats were deemed sufficient. The work done has wrought a great change. The new casing of the tower is particularly noticeable. The bells in the tower have been recast and rehung, and the quality of the peal is very good and pleasing. In the interior the architect (Mr. Cossins) has necessarily been tied to the lines of the old building, but he has made the most of the opportunities these afforded of improving the appearance of the church, adding to its comfort, and modernising its features. A new chancel has been built, and the other extensions of accommodation give substantial gain in several directions. A new organ chamber is provided. The old pews are replaced by pitch-pine seats, and the ventilation and heating have had due attention. Mr. C. A. Horton was the contractor.

were removed, and other alterations made. Meanwhile, owing to the borough surveyor having condemned the tower as dangerous, a portion of the structure was taken down to prevent collapse, and the remainder was removed subsequently. The new tower will be about 80ft. high. It is to be constructed in three stages, with a ringing chamber on the first floor and a bell chamber at the top. The ground floor of the tower will form part of the church, the old western door being inserted in the west wall, whilst the new tower arch will form an entrance. All the new dressings are to be of Cheesewring granite, and for the exterior facing up to the first stage the granite facings from the old tower will be utilised. Above this point a hard blue slate stone from Tencreek Quarry, near Liskeard, will be used. The interior walls of the tower will be lined with buff-coloured stone from St. Cleer. The whole of the interesting old features of the former structure are to be preserved wherever possible; and the actual

material from the old tower will be worked into the new building, including the old arch which formally stood at the west end, the small Norman windows, and the ancient Norman arch, the stones of which were discovered used as walling in the old tower. At the base of the tower is to be placed a baptistry. It is hoped to provide a peal of eight bells, adding to the present peal of six. The summit of the tower will be battlemented, and at the north-west corner there is to be an octagonal turret with interior spiral staircase. Mr. G. Trehane, Liskeard, is the builder, the amount of the contract being £5,126, of which about £3,000 remains to be raised.

PROCESS ENGRAVING.*

By CARL HENTSCHEL.

THE earliest form of engraving was that used by the Assyrians for the purpose of stamping impressions on bricks and other articles in clay; other stamps were made in brass for marking cloth, and it is said these stamps were also used for branding slaves. Improvement followed improvement, and about the end of the fourteenth or the beginning of the fifteenth century the German card makers, it is believed, adopted the principle of engraving in relief for the purpose of impressing the outlines of figures upon their cards, the outlines being afterwards filled in with colour. In Earl Spencer's library at Althorpe there is a copy of the celebrated woodcut of "St. Christopher," dated 1423. Its authenticity has been so well established that its production may be accepted as the historical starting point of this branch of the art of engraving. William Caxton, besides being acknowledged the first printer of England, is also credited with introducing wood engraving into this country. The next development of the art was the introduction of what is technically called cross-hatching. This consists of lines crossing each other at different angles; as these lines are closer together, so is the shading graduated. The "Nuremberg Chronicle" contains some instances of cross-hatching published about 1493. At this early period, Albert Dürer's name stands out before all others, both as an engraver and as an artist.

Among the earliest workers in the new world of art was William Hogarth. In 1733 appeared that famous series of prints "The Harlot's Progress," published by the artist and engraver. After about thirty years, British engraving sprung up from its condition of poverty, degradation, and obscurity to be a source of wealth and honour for its workers and publishers. About this time steel gradually took the place of copper for engraved plates.

It is recorded that Thomas Bewick and Robert Branstons were pioneers of wood engraving in England, and it is interesting to note that the earlier wood blocks were cut with knives, not with gravers. But it was to John Thompson, a pupil of Mauston, that the art of wood engraving was indebted for its early progress. He improved the tools, gave great care to the choice of material, and brought a large amount of practical study and artistic ability to the successfully achieved task of spreading abroad into a wider field the growing demand for wood engraving. Without tracing wood engraving down to the present period, it is worth while to point out that the very element which worked so much evil to steel and copper engraving was soon active in lowering the artistic quality of wood engraving—that is to say, cheapness (one of the traits of education and civilisation). At the present day the same thing is happening, and so I suppose it will always go on, the insidious influences of undue rapidity and cheapness undermining all artistic work. Amongst those who will always take a high rank in the modern English school of wood engraving are:—John

Jackson, H. Linton, W. J. Linton, E. Landells, W. T. Green, J. W. Whymper, W. H. Powis, Joseph Swain, W. L. Thomas, G. and E. Dalziel, and Mason Jackson.

Photo-engraving, which is in reality "process," is older than photography, since Niepce in 1814 commenced experiments, and in 1824 (if not earlier) actually produced proofs from photo-etched plates. In 1842 Poitevin endeavoured to prepare printing plates from Daguerreotypes. Fizeau improved this process and obtained results resembling photogravures. Talbot's first process was patented in 1852 and was called phototypy. Up to this time it may be said to have been the most important process of the day. It was he who suggested the use of those glass plates, ruled with fine lines or covered with opaque dots, which are the basis of half-tone work. Carl Klic, of Vienna, is said to have improved upon Talbot's methods considerably. The idea of a lined screen was followed by Berchold, in France, and C. J. Burnett, in England, in 1857 or 1858. In 1861, Baron F. W. von Egloffstein experimented with ruled screens in Philadelphia, and in 1865 E. and J. Bullock patented and worked for fifteen years a process in which the grain was produced by a line netting of cross lines.

It was, however, left to a Frenchman, M. Gillot, to perfect the etching of the line block. It must not be forgotten that all the early plates were either drawn on zinc or on transfer paper or litho stones, and then transferred to zinc and etched. It was not till later that the method of photographing direct on to the zinc was adopted. It was my father who at that time was endeavouring to photograph direct on to zinc, and his process, by those who were capable of judging, was considered the finest ever introduced. Some fine results were obtainable through wire gauze, but the scientific principle and method of breaking up the dots had not been gone into. It was Mr. Ives who first went thoroughly into this matter, and whose researches and experiments have proved of so great value to the trade. Pretsch blocks were really the first half-tone grain blocks, and the Pretsch process was developed by Swan, who obtained the gelatine relief with carbon tissue, thus avoiding irregular swelling and granulation of the gelatine, and afterwards by Geymet, Roussillon, Dawson and others. Messrs. Sprague's process (called the ink-photo process) must be mentioned as being based on the reticulated gelatine grain principle.

It is interesting to look back upon the early days and compare our present methods. I can well remember a time when if a block was turned out in a week it was thought something wonderful; afterwards, when I succeeded in turning out a block in twenty-four hours, it was specially noticed in the Press, and when a double-page pencil drawing by Melton Prior for the "Illustrated London News" was reproduced in nine hours the fact was regarded as marvellous. Now-a-days half-tone blocks are wanted in two to four hours and line blocks in two hours. From an artistic point of view this is to be deplored, but we live in an age of nervous rush and one must go the pace or be left behind; it is the pace that kills the workmen as well as his art, for certainly no one can put his best work into a block when only minutes are allowed for a difficult process requiring hours. But to return to our outline history. A name that stands out with great prominence in the evolution of process work is that of Meisenbach, who patented his process in 1882. Its important feature was the use of a finely-ruled glass screen, which was interposed in the camera between the original and the negative, the effect being to break up all the gradations and half-tones into different size blacks and cross lines.

This is the means employed in modern process work, and it may be interesting to note in conclusion how the cheap and rapid production of printing blocks by the photo-mechanical process is killing the art of wood engraving. The following numbers of firms show this:—

	1876.	1879.	1884.	1887.	1895.	1900.
Wood Engraving —	130	162	158	131	80	80
Process ...	1	2	6	14	53	56

BUILDING CONTRACTS.

RESPONSIBILITY FOR DELAY.

THE question in the case of *Leslie and Co., Ltd. v. The Managers of the Metropolitan Asylum District* (heard recently in the Queen's Bench Division of the High Court of Justice) arose upon a contract for the erection of a hospital for infectious fevers at Hither Green, Lewisham. A great part of the work had been let out to sub-contractors and experts, including Messrs. Doulton, of Lambeth, and Messrs. Berry and Sons, of Westminster. The contract between the plaintiffs and defendants provided that the plaintiffs should execute "the works" shown on the plans, including the chimney stacks and heating apparatus. The time in which the work was to be completed was two years, and the price to be paid was £210,000.

Among the works to be erected were twenty-nine chimney stacks, and with reference to these a correspondence took place between a Mr. Hall, the architect of the defendants, and Messrs. Doulton, as the result of which a price of £137 10s. for each stack was named. The contract contained the following clause relating particularly to these chimney stacks:—"The contractor shall provide the sum of £137 10s. prime cost for each central stack of flues in large wards above the level of the ground floor. These stacks will be of faience, fireclay, terra-cotta, and concrete, and, including, hearths, grates, &c., will be supplied, fixed, and finished complete by a specialist potter. The contractors are to supply all necessary scaffolding, plant, water, and hoisting." The plaintiffs then communicated with Messrs. Doulton, who undertook to do the necessary work. Part of the claim in the action arose from the alleged delay on the part of Messrs. Doulton in doing this work. A second head of claim arose from a sub-contract for the supply of the necessary steam and hot-water apparatus. A sub-contract was made between the plaintiffs and Messrs. Berry and Sons, by which the latter agreed to supply this apparatus for £11,900. It was alleged that Messrs. Berry had also been guilty of delay in executing this work. Owing to these alleged delays the plaintiffs could not complete their works and get the architect's final certificate and payment accordingly. They therefore claimed damages on the footing that there was an obligation upon the defendants to see that the work was done by the specialists and sub-contractors within a reasonable time. The claim was referred to an Official Referee, who considered the contract and voluminous correspondence involved in the case. Counsel for the defendants asked the learned Referee to non-suit the plaintiffs on the ground that Messrs. Doulton and Berry and Sons were sub-contractors with the plaintiffs, and any claim for delay lay against them and not with the defendants. The learned Referee refused to non-suit, and this was a motion by way of appeal from that refusal.

Mr. Justice Bigham, in giving judgment, said that the contract contained an undertaking by the plaintiffs to execute the works, which, in his view, meant the whole works to be done in accordance with the specifications, including the work actually done by Messrs. Doulton and Berry. The definition of "works" in the contract was wide enough to cover the works in question. The contract contained a clause by which the defendants reserved to themselves the right, that is to say, the option, to employ other parties to execute the works for which provisions were made. That would enable them to employ Messrs. Doulton and Berry. But this option, in his Lordship's opinion, the defendants did not exercise, but left the obligation on the plaintiffs to execute these works; in other words, they left the plaintiffs to enter into the sub-contracts with these specialists. The difficulty in the case arose from the provision that "contracts will during the progress of the works be let to other persons." In his Lordship's opinion that did not amount to an undertaking that the works should be let, but was merely a statement of what would become

* Résumé of a paper read before the Applied Art Section of the Society of Arts on April 3rd, 1900.

a fact and was in the contemplation of the parties. They foresaw that a contract would have to be entered into with other parties, possibly by the defendants, and provided that, in connection with such contracts, the plaintiffs should give the sub-contractors full opportunity to carry out their works. Therefore, it was the duty of the plaintiffs to enter into the contracts with these specialists. The defendants might have to indicate the specialists and to arrange contracts which should be within the specification; but having done this, the obligation of the defendants was discharged. It was then the duty of the plaintiffs to see that the contracts contained clauses and provisions which should either enable them to complete their works within the specified time or should specify penalties in the nature of damages to compensate the plaintiffs if, through delay of the specialists, the plaintiffs were unable to carry out their contract with the defendants. If the plaintiffs had failed to protect themselves in this way, it was a misfortune which they must bear themselves. It followed that the plaintiffs could not saddle the defendants with the consequences of the delay by the specialists, and the learned Official Referee ought to have held that these damages were not recoverable.—Mr. Justice Phillimore concurred.

Engineering Notes.

An International Tramway Congress is to be held in Paris from September 10th to 13th. Details are obtainable at 5, Henrietta Street, W.C.

Electric Light for Newark.—The Board of Trade have granted a Provisional Order to the Corporation of Newark to supply electricity within the borough, and to expend for that purpose £20,000.

Batley's Electric Traction Scheme Sanctioned.—The Board of Trade have issued an order sanctioning the Batley Corporation's application for leave to construct tramways throughout the borough.

Artesian Well for Hampstead.—The Hampstead Vestry are about to make an artesian well at their electric lighting station. It will be 400ft. deep, and the yield will be 5,000 gallons per hour.

Halifax Waterworks.—Tenders are to be invited for the execution of the works in connection with the construction of three reservoirs at Walshaw Dean, which are estimated to cost between £150,000 and £160,000.

Electric Light Extensions at West Hartlepool.—At the meeting of the West Hartlepool Town Council on April 3rd the Electric Lighting Committee were authorised to increase their borrowing powers by £19,000 for the purpose of extension of mains, &c.

New Gas Works at Cromer have been opened by the Cromer Gas Company. The capacity at the works at present is about 20,000,000 cubic feet per annum, but very slight extension will enlarge it to 40,000,000 cubic feet, when the capital cost will be proportionately reduced.

New Bridge at Rothiemay.—The new steel girder bridge which has been thrown over the river Deveron at Rothiemay by the Great North of Scotland Railway Company has now been completed. It was designed by Mr. P. M. Barnett, C.E., the Great North Railway Company's engineer-in-chief, and the contract for steel and iron work was placed in the hands of Messrs. Findlay and Co., of Motherwell.

New Waterworks at Arbroath.—After long and tedious operations in connection with the augmentation of the water supply for Arbroath, the new works at the Nolt Loan have now been practically completed. Mr. McCulloch, C.E., Edinburgh, was, after several plans had been discussed and disapproved, engaged as engineer for the works, which, it is understood, have cost £8,000.

Mr. Rogers Field, B.A. (London), M.I.C.E., whose death we briefly recorded last week, designed and superintended the

construction of the drainage and water supply arrangements of a great number of public institutions and private buildings in all parts of the country, including the drainage of Sandringham House and Bagshot Park. The automatic flushing tanks and syphons which he brought, after many laborious experiments, to a high degree of perfection, are largely used in drainage and sewerage works both in this country and in America. Mr. Field was connected with the Sanitary Institute from its commencement twenty-four years ago, and was for many years one of the most active members of its council and various committees. Moreover, he introduced thoroughly practical methods of judging at the exhibitions held at the annual congresses of the Institute. Through his generosity the Parke's Museum was entirely re-arranged and a catalogue of its contents issued.

Electric Light at Doncaster.—On April 2nd the Mayoress of Doncaster (Mrs. Bentley) turned on the light at the new electric light and power station in Grey Friars Road. It is proposed to erect tramcar sheds on the site immediately behind the swimming baths, and provision has been made in the arrangement of steam piping at the electric light station for heating both the slipper baths and the swimming bath by steam from the electric light boilers. The chief engineer of the electric light undertaking is Mr. James N. Shoolbred, C.E., of 32, Victoria Street, Westminster. Mr. Carl A. L. Prusmann is the resident electrical engineer of the Corporation. Mr. Crabtree, C.E., the borough surveyor, acting on lines laid down by Mr. Shoolbred, designed and superintended the construction of the electric light and power station buildings and chimney, and was assisted by Mr. Stacey, Mr. William Simons acting as clerk of works. Messrs. Charles Sprakes and Son, of Doncaster, were the contractors for the buildings; Messrs. Mather and Platt, Salford, contractors for the engines; Messrs. Tetlow Bros., Oldham, contractors for the boilers; and Messrs. Callender and Co., London, contractors for the cables. Stone for the area and footpaths was supplied by the Hard York Patent Stone Company, Lightcliffe. The price charged by the Corporation is 3d. per unit for power and 5d. per unit for light. The system is the three-wire continuous current, 230 voltage. The Mayor, before turning on the steam of the first engine, said that in 1764 the town was lighted with oil lamps, and the cost was £131. In 1827 a gas company was formed, and the Corporation were shareholders, the cost of the works being £11,600. Afterwards the Corporation secured the works for £17,000, and the works now stood in the books of the Corporation at £66,000. He held that the introduction of the electric light would not reduce the value of the gas works. The present works were only a portion of a full scheme, which included electric trams, and would cost £100,000. The sum of £30,000 would be devoted to the erection of the present works. About £70,000 was to be expended in the provision of electric trams, which would cover a distance of about seven miles.

For the Gladstone Memorial £5,830 has been received from 82,250 persons. A commission for the work was given about eighteen months ago to Mr. F. W. Pomeroy, the sculptor, who has nearly completed the statue, which, with the permission of the Office of Works, will be placed in the Central Lobby of Parliament and will be unveiled on Saturday, May 19th, by Sir Henry Campbell-Bannerman.

New Lunatic Asylum for Birmingham to cost £240,000.—At last week's meeting of the Birmingham City Council the Lunatic Asylums Committee proposed that the tender of Messrs. John Bowen and Sons for the erection of a new asylum at Hollymoor at a cost of £207,256 should be accepted; that tenders for other works necessary for the completion of the building be accepted; and that the sum of £240,000, the estimated total cost of the work, be borrowed. This was agreed to.

Builders' Notes.

Aberdeen Granite Work at the Paris Exhibition.—Messrs. Garden and Co., of the Victoria Granite Works, Aberdeen, will exhibit at the Paris Exhibition a military tomb composed entirely of Hill o' Fare granite. The exhibit is interesting as being the only one, it is stated, from Aberdeen granite merchants.

A Technical Dispute about Penalties.—The case of the *Buxton Lime Firing Company, Ltd., v. James Howe*, heard in the Queen's Bench Division on April 2nd, was a special case stated by justices of the peace for the Bakewell division of the county of Derby. Howe was in the employ of the plaintiffs, but, according to the agreement between them, he was "subject to a fine, or penalty, or drawback of 2s. 6d. for each and every working day on which he was absent without leave, except in case of sickness." If he broke any of the conditions he could be dismissed without notice, and could claim nothing for damages. On September 13th last Howe applied for leave of absence on the following three days, and leave was granted for the first day and refused for the other two. On hearing this he said he should take French leave, and did so. He afterwards returned and received wages, but no demand for penalties was made upon him. The company preferred their claim under the Employers' and Workmen Act, 1875, and claimed 5s. for Howe absenting himself without leave. The justices had dismissed the summons, but the Court allowed it.

The Rise in the Price of Materials is plainly shown by the table given below, which is taken from the last agenda of the School Board for London, who have accepted the increased prices:—

	Present price. s. d.	Revised price. s. d.
Best ground white lead...	16 6 cwt.	23 0 cwt.
Refined red lead ...	13 0 "	20 0 "
Turpentine ...	2 0 gall.	3 2 gall.
Lead milled ...	10 6 cwt.	17 6 cwt.
Lead pipe ...	11 0 "	18 0 "
Lead soil pipe ...	13 0 "	20 0 "
Zinc sheets V.M. ...	21 0 "	26 0 "
Solder, plumbers' ...	44 0 "	57 0 "
Solder, tinmans' ...	54 0 "	84 0 "
Solder, blow-pipe ...	65 0 "	102 0 "
Ingot tin, lamb and flag ...	86 0 "	152 0 "

Workmen's Compensation: A Scotch Case.—Mrs. Elizabeth Colquhoun, widow, was allowed compensation to the amount of £93 12s. in a recent action under the Workmen's Compensation Act in respect of the death of her son, a joiner. The deceased was in the employment of James Laidlaw, joiner, Playfair Street, Glasgow, who was a sub-contractor to Sir William Arrol and Co., Limited, Glasgow, the respondents in the erection of a new engineering shed at the Lanarkshire Steel Works, Motherwell. Colquhoun met his death by falling 40ft. off a building. At the time he was standing on sarking boards laid in the "pattern loft" of the works, and he was engaged sawing wood on these boards and having it handed up to the roof. The main question was whether the building was being constructed by means of a scaffolding. It was held that the sarking boards used should be regarded as a scaffold.

Gas Works and Building By-laws.—In the recent case of the *London County Council v. The Wandsworth and Putney Gas Company*, heard in the Queen's Bench Division, the question for decision was whether the gas company were empowered by the special Acts of 1866 and 1880 to erect buildings in contravention of the general Acts relating to buildings in London. The complaint was that the respondents had built a purifying house within 15ft. of the centre of the highway. The contention of the respondents was that they did not come within the London Building or the Metropolitan Management Acts, and the magistrate dismissed the summons, but stated a special case.—Lord Robert Cecil submitted that the learned magistrate was right in dismissing the summons, as the private Acts of 1866 and 1880, read together, gave the gas company power to erect buildings on whatever part of their own land they thought fit, and

section 205 of the London Building Act, 1894, expressly exempted them from the conditions imposed by section 13.—Mr. Justice Ridley, in giving judgment, said he thought the respondents were subject to the London Building Act. The company, in contending they had power to put their buildings where they thought fit, had to satisfy the Court there was something in their Acts which was inconsistent with the Act of 1894. He did not find there was any expression in the respondents' series of Acts that led to that conclusion.—Mr. Justice Darling concurred, and the appeal was allowed, with costs.

A Case about an Electric Lift—The action of *Turner and Sons v. Brinsmead*, heard in the Queen's Bench Division on Saturday, was to recover £260 for work and labour done and materials supplied. Defendant pleaded that the plaintiffs had committed a breach of contract, and he counter-claimed for £608 8s. beyond the amount of the plaintiffs' claim. It appeared that in 1897 the defendant was engaged in the construction of some flats at Maitland Park, Haverstock Hill, N.W., and he entered into a contract with the plaintiffs by which the plaintiffs agreed to supply for £260 an electric lift which could be worked by the occupants of the flats without the assistance of an attendant. Plaintiffs said that they supplied and fixed the lift in accordance with the contract, that it was approved by the defendant's engineer, and that, therefore, they were entitled to recover. Defendant, on the other hand, submitted that the lift was fragile and unfit for the purpose for which it was required, that it was not supplied in the time specified in the contract, and that in consequence of its condition it had to be removed and a more durable lift put in its place. He further said that in consequence of the plaintiffs' breach he was unable to let certain flats, and had been put to an expense of £608 8s. beyond the amount of the plaintiffs' claim.—Mr. Justice Mathew, who had reserved judgment, now suggested that the parties should come to terms, and it was eventually agreed that the record should be withdrawn, the plaintiffs would pay £100 towards the defendant's costs, and the plaintiffs would have back their lift, with the exception of £99 worth of the work, which the defendant would keep without payment.

London County Council.—At last week's meeting of the Council the General Purposes Committee brought up the report on No. 17, Fleet Street, which we gave on page 152 of last week's issue; after discussion this was approved by a majority of one, so that the "palace" will be preserved.—Reporting on the syllabus of instruction prepared by the Sanitary Inspectors' Examination Board, on which the Plumbers' Company have a representative, a joint committee of the Public Health Committee and the Technical Education Board recommended that the Council should have two representatives on the examination board, one to represent it in its sanitary aspect and the other in its educational aspect; and should make an application to the Local Government Board accordingly. This was agreed to.—The Finance Committee reported that several of the workmen in the employ of the Works Department had been detected, convicted, and sent to prison for practising what was known as the "dead men" fraud. Forged requests for wages to be paid to nominees by men who had left the Council's employ, or who were not working, were, with the connivance of a timekeeper, passed, with the result that the Council had been defrauded of over £100.—The Housing Committee recommended in connection with the Council's Housing Bill: (1) The extension of the period for the repayment of the capital cost of working-class dwellings from sixty to one hundred years; (2) the value of the land on which the dwellings are erected being taken as an asset against debt, instead of being repaid within the sinking fund period as at present; (3) the amalgamation of accounts under the different parts of the Act, so as to show the true cost of improvement on housing schemes affected by the Act. They also recommended that a joint deputation of the Housing of the Working Classes

and Parliamentary Committees should wait on the president of the Local Government Board in order to induce him to include the above amendments in the Bill. This was deferred.

Interesting Workmen's Compensation Case.—The case of *Former v. The Danville Asbestos Plastering Company* was heard in the Court of Appeal on Saturday. The facts were as follows:—The owner of 72, Coleman Street, E.C., decided to entirely reconstruct the interior of the building, making contracts direct with various persons to do each of the different branches of the work. He agreed with the Danville Asbestos Plastering Company to do some 1000ft. super. of plastering work, and the applicant was one of the men the company employed to take down the old plaster and put up the new. The scaffold on which he was working gave way, and he sought compensation for injuries sustained. The case came on in the City of London Court on February 14th, three days before the Court of Appeal decided in the case of *Mason v. Dean* (see issue for February 28th last) that a firm who took their contract to do work directly from the building owner were undertakers, and not sub-contractors within the meaning of the Act, though the owner had contracted with another builder to carry out all the building operations except that part of the work which he had himself directly contracted with a third party to do for him.—Mr. Roskill, for the company, said it was uncertain who was the building owner. The learned judge, after hearing the evidence, came to the conclusion that somebody, he could not say whom, had been engaged by the building owner to reconstruct the interior of the premises, and therefore that the respondents to this appeal were merely sub-contractors of that unknown person, and not liable under this Act to their workman.—Lord Justice Collins, in giving judgment, said it was clear that somebody was the building contractor, and that the present respondents were merely sub-contractors. He thought this case was distinguishable from *Mason v. Dean*, in which the building owner had contracted with a third party to build for him the Lyceum Theatre at Eccles. By a clause in that agreement his architect was to have the option of giving out any of the finishing work to other firms, and under that clause Messrs. A. R. Dean, Ltd., were directly engaged to construct and decorate the proscenium and boxes. That was a different case to this, as it appeared that the owner here was also the builder. The building owner, therefore, whoever he might be, was the undertaker, and the present respondents were merely his sub-contractors, and as such not liable under this Act to their workman. The other Lords Justices concurred.

Workington's Town Hall.—At last week's meeting of the Workington Town Council a heated discussion took place on a motion not to proceed with the building of the new town hall. This motion was lost by eleven votes to thirteen. The first prize for the competition for the town hall was awarded to Messrs. Oliver and Dodgshun, of Carlisle and Leeds.

Leeds City Council.—At last Wednesday's meeting of the Council it was decided to purchase the Gateforth Estate, near Selby, for £85,000, as a site for intended new sewage works. It was also decided to pay £46,000 for St. Ann's Cathedral, and to provide another site for the vendors. The property covers an area of 3,120 square yards and is required for the widening of the lower part of Cookridge Street, where vehicular traffic is now often congested.

Van Dyck Memorial.—A correspondent to a contemporary says: "Five years later (1646) the fine monument erected over Van Dyck's grave perished in the Great Fire of London, which also destroyed the whole of old St. Paul's Cathedral. But is it not extraordinary, is it not strange in the extreme, that among the numberless monuments which have since been placed in the new cathedral of St. Paul's there is not even a simple memorial tablet to remind visitors that the illustrious Van Dyck once lay buried in London's great old cathedral?"

New Patents.

These patents are open to opposition until May 14th.

1899.—Scaffold Boards.—5,344. J. J. CARR, Malton, Yorks. The underside of the plank is grooved, and at the end of each groove a strong spike is fixed. The plank is then bent and a wire fixed across and secured by passing the loop at each end over the head of the spike. When the plank is released the wire lies taut in the groove and is fixed there with staples. A plank treated in this way is stated to be rendered much less springy.

Collapsible Tables, &c.—5,466. L. H. ELLINGTON, London. The descending platform is connected to two flap lids that ordinarily form the top of the table, but it is also connected by a series of levers to a piston rod which works in a perforated cylinder fixed underneath the table. As the platform is being lowered the air is compressed, so that when it is being forced out by the falling piston it acts as a cushion.

Ventilation of Sewers.—5,735. R. T. PRESTON and G. R. RALSTON, London, S.E. The object of this invention is to do away with the injurious effect of noxious gases escaping from sewers up ventilating shafts. For this purpose water pressure from the main is utilised to cause the sewer gas in the vicinity of the shaft to pass through water and to mix with fresh air, the gas then escaping into the atmosphere.

Electric Light Globes.—6,054. S. BERDITSCHESKY-APOSTOLOFF, London, E.C. This invention relates to a light refracting and diffusing screen for an electric lamp, and consists of a globe formed of a spirally-coiled glass rod covered by an outer plain globe. The globe is made in two parts.

Ventilating Water Closets.—8,005. J. MCINTYRE and THE SANITARY VENTILATING SYNDICATE, LTD.; both of Dublin. In order to draw off any smell from water-closet apartments, there is fitted on top of the cistern a water turbine with propellers for spokes. This turbine is driven by the water as it enters the cistern, and so draws off the foul air. It is covered, of course, by a casing or splash rim.

Varnish-mixing Machinery.—8,889. T. C. BARRACLOUGH, London, and T. T. HEATON, Uxbridge, Middlesex. The mixing drum is of metal and has a smooth inside surface. It revolves on a hollow axis which is arranged to receive steam, hot water or gas, several regulating appliances being provided. By these means the mixing is improved and expedited and a regular and increased output obtained.

Paint for Outside Work.—9,652. J. R. HATMAKER, London, S.W. First take 300 parts of well-dried, powdered talc or steatite and 183 parts of red or white lead, and mix together. Lampblack or any suitable colouring can be added if desired. Next mix together some boiled linseed oil and linseed oil varnish in the proportion of three parts of oil to one of varnish. Sufficient of this mixture is added to the pigment ingredients, and the whole is then well ground. Lastly, a dryer is added. Paint made in this way is said to be very durable and quite impervious to water.

Brick-making Machines.—10,599. A. ADAMS and W. NEALE; both of Old Fletton, Hunts; and L. SIMPSON, Eye Green, Peterborough. The plunger or other part to which it is desired to convey steam is connected to the fixed part of the machine by metal tubes that slide within each other. The fixed part of the machine is connected to the boiler. This arrangement economises steam.

The following specifications were published on Saturday last, and are open to opposition until May 21st. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—5,566. HINTERBERGER, ventilating rooms and other enclosed spaces. 5,603,

COULON, apparatus for the manufacture of artificial stone. 6,329, PATERSON, filters. 6,333, GLITSCH, lighting and heating apparatus using liquid combustible. 6,832, CODD, non-return valves for steam, water and gas, and other fittings. 7,134, WOOD, spirit levels. 7,347, DENYER, hot-water radiators and similar heating apparatus. 7,538, CUSSONS and EAGLES, machine for testing the strengths of materials. 7,746, KAY, LOBLEY and BUNKALL, brick-making machines. 8,148, HORWOOD, disinfecting apparatus for closets, drains, &c. 8,210, HOPPS, manufacture of Portland cement. 8,378, FASSETT, door catches. 8,912, ASTON, parquetry, marquetry, mosaic and similar woodwork for various purposes. 9,101, PENNYCUICK and BARRETT, globes or protectors for electric and other lighting apparatus. 9,322, ELLEN and DAVIES, acetylene gas generators. 9,384, KNOX and KNOX, circular-saw frames. 9,401, CARINGTON and MEIKLEJOHN, self-closing cocks. 9,441, ALEXANDER, drying chamber for the hardening of bricks, artificial stone, &c. 9,544, HOEVEL, chains. 9,690, DENAYROUZE, incandescence lamps. 9,714, ASA LEES and Co., LTD., and DUNKERLEY, guards for circular saws. 10,330, CRITALL, radiators for heating and cooling. 10,381, ANDERSON and DICKIE, valves and cocks. 10,506, SUGG, gas lighting. 10,743, POWERS, apparatus for generating and storing acetylene gas. 11,372, HUDSWELL, window-sash fasteners and holders. 13,038, ROBERTSON, means for securing tiles and marble slabs to walls, ceilings, and other surfaces. 16,166, BOULT (*Isitt*), manufacture of mantles to be used in incandescent gas lighting. 22,511, CLARE, combined timber and concrete walling, flooring, and roofing. 23,566, BERNSTEIN, gas burners. 24,327, DODGE, stair lifts. 24,829, POPESCO, locks. 25,088, BECK (*Pataky and Pataky*), filters. 25,293, ANDERSON, apparatus for treating water by heat. 25,336, KARUTZ, indicating device in connection with glass doors.

1900.—320, MARTIN, roofing plates and machines for manufacturing them. 1,495, ALLEN and DAVIS, acetylene gas generators. 1,999, DRESSER, detachable pipe couplings. 2,248, BEESE, inverted gas burner for incandescent lamps. 2,867, SCHLICKEYSEN, brick, tile, and pipe moulding machines. 3,205, VALSLER, apparatus for raising and delivering water under pressure.

Under Discussion.

Mr. Blashill on Housing.

Mr. Thomas Blashill, F.R.I.B.A., late superintending architect to the London County Council, addressed the Sanitary Institute on Wednesday evening on the subject of "The Housing of the Working Classes in London in the Future." Mr. Blashill urged that municipalities instead of paying heavily for slum property for clearance ought simply to rehouse the affected tenants elsewhere, and thus reduce the expense of such housing schemes by three-fourths. A census should be compiled of all overcrowded houses, and penalties enforced against the admission of more inmates until the numbers were reduced below the lawful number. The local authority should set about providing accommodation for the families who would have to leave because of overcrowding. In view of the cheapness of transit, the new accommodation need not necessarily be in the same neighbourhood. In most cases it would be necessary to rehouse at greater cost than the families could afford, as some of them who had lived in one room would have to take two or three in order to prevent overcrowding. This extra cost would have to be provided in the first instance by the municipality, including compensation for long distance travel, by payments made on account of the weekly rent paid direct to the owner of the newly-acquired tenements. If the new tenements had been built by the municipality such an arrangement would be very simple. The municipality required larger powers to compel owners to keep their property in a healthy state.

Surveying and Sanitary Notes.

For Street Improvements at Halifax £78,859 are to be borrowed.

Insanitary Houses at Liverpool.—In the course of a recent lecture before the New Century Society at Liverpool, Dr. W. Permewan said that there were more than 8,000 insanitary houses in the city, being, in the words of the Act, "unfit for human habitation."

At the Hull City Council Meeting last Thursday the minutes of the Sanitary Committee, containing a scheme for the substitution of water closets for the present dry-earth closets throughout the city, were the cause of much discussion. It was eventually decided to call a special meeting to consider the question towards the end of the current month.

An Extensive Drainage Scheme for Wirral, Birkenhead.—Messrs. Beloe and Priest, engineers to the Wirral Rural District Council, submitted completed plans and estimates to that authority on April 2nd for the Fender Valley outfall sewerage scheme. This scheme is to embrace a wide area, covering twelve or thirteen townships and a small portion of the borough of Birkenhead, and the total estimated cost is £27,500. The Council resolved to submit the scheme to the Local Government Board.

Disinfecting Water Mains.—At a meeting of the Society of Engineers held on April 2nd a paper was read on "The Disinfection of the Maidstone Water Service Mains," by Dr. G. Sims Woodhead, M.A., and Mr. W. J. Ware, M.B.A. of Water Engineers. After briefly describing the position of Maidstone and the growth of its population, the authors gave an account of the conditions under which it was found necessary to carry out sterilisation of the mains in order (1) to do away with the possibility of any infective material that might have made its way into the main remaining in any of the pipes, especially in the dead-ends; and (2) to restore public confidence, which could only be done by rendering it absolutely impossible for any such infective material to remain. After a careful study it was decided that the mains and service pipes should be filled with chlorinated lime solution in a strength of at least one per cent., or one-third per cent. of the available chlorine. On a Saturday night the entire water service of the town was shut off except from a few selected houses in the district worst infected. Chloride of lime was first mixed with the water in the reservoirs and forced through the mains until the outflow in the house taps became milky. Then the mains were pumped empty by means of fire-engines, the reservoirs thoroughly cleansed, and pure water allowed to flow. The operation, which occupied twelve hours, is the only instance of disinfection of water-mains on so large a scale. Apart from some damage to washers, clothing and pump-buckets, no ill effect of any kind was traceable to the use of the chlorinated lime solution. As a result of the treatment, everyone was satisfied that, so far as the mains and service pipes that conveyed the high-pressure water were concerned, there was no possibility that any typhoid organisms could continue to exist in them.

Bawtry Church is being restored. From the body of the church all the old pews, which were put in some sixty years ago, have been cleared out. The west gallery, too, has been removed, and the west tower arch exposed to view. It is expected that the work will last some months, as the plaster and stucco have to be taken off the walls and the masonry of the exterior pointed afresh. The floor is also to be covered with concrete and wood blocking, and the roof to be boarded with oak boards. The work will cost about £2,370, without the seats and fittings.

Keystones.

New Liberal Rooms at Saltcoats have been opened.

Jeffrey Square, St. Mary Axe, E.C., is to be closed.

The death is announced of Mr. Frederick Church, the well-known painter and illustrator.

Four new Stained-glass Windows in Maybole Parish Church have been erected by Messrs. Stephen Adam and Son, of Glasgow.

A new Mission Hall at Paisley is being built from designs by Mr. John Robb, architect, of Glasgow. The cost will be about £1,400.

Eight Cottage Homes at Stockton have been completed by the Board of Guardians. The cost has been between £10,000 and £11,000.

Re-opening of Spurgeon's Tabernacle.—It is understood that the opening of this place of worship will take place on September 19th next.

York House, Twickenham, the residence until recently of the Duc d'Orléans, is to be sold by private auction. The price will lie between £30,000 and £40,000.

The Death is announced of Mr. G. R. N. Wright, F.S.A., at the age of eighty. He was connected with the British Archaeological Association from its foundation in 1843.

Restoration of a City Crypt.—The ancient Norman crypt which extends under the whole length of the parish church of St. John's, Clerkenwell, is to be restored at a cost of £1,400.

A new Hotel at Southwold, called the Marlborough Hotel, has been built from designs by Mr. Arthur Pells, F.S.I., of Beccles. The hotel is situated at the corner of Danwich and Corporation Roads.

Birmingham Ruskin Society.—The membership of this society now stands at 477, an increase of fifty-two over the previous session. There is a balance in hand on the general account of £41 14s. 4d.

A new Church at Cardiff is being erected from the designs of Mr. E. M. Bruce Vaughan at a cost of £5,000. It is situated in West Bute Street and will accommodate 500 persons. Messrs. E. Turner and Sons are the contractors.

The Waddesdon Collection of Art Treasures, now at the British Museum, which Baron Ferdinand de Rothschild bequeathed to the nation, is representative of the productions of the later Renaissance. It comprises cups, vases, goldsmith's work, enamels, armour, and carvings in wood.

Court of Common Council.—At last week's meeting of this council the tender of the Limner Asphalt Company, amounting to £5,980 13s. 6d., for paving the carriage-way of Holborn Viaduct, was accepted. It is hoped that a final decision will shortly be come to with regard to the competitive designs for the rebuilding of the Old Bailey.

Result of Competition.—Mr. W. McLaughlan, of 43, Houldsworth Street, Glasgow, has been awarded the premium of one hundred guineas offered by the British Charrier Wood-Carving Company, Limited, of 49, St. Mary Axe, E.C., for a design of the interior of a room showing the best application of their carving. Professor Aitchison was the assessor.

New Buildings at Darwen.—The students attending the building construction classes at the Darwen and Westhoughton Technical Schools recently made a joint sessional visit to works in progress in the town. The Provident Co-operative Society's new central stores (architects, Messrs. Sawes and Green) were first visited, and the party then went on to the new electricity and refuse destructor works, over which the students were conducted by Mr. R. W. Smith-Saville, A.M.I.C.E., the borough engineer. The cost of the latter works up to the present time has been about £24,000.

New Companies.

Hillsbrough Estates, Limited.

This company was registered on March 19th with a capital of £16,000 in £1 shares to acquire from H. Ripley certain freehold lands at Wadsley, near Sheffield, to lay out and develop such lands for building and other purposes, and to carry on the business of brick, timber, and lime merchants, &c. The first directors (to number not less than two nor more than six) are G. E. Branson and H. Ripley. Registered office: 9, Bank Street, Sheffield.

CONTRACTS OPEN.

CITY of WINCHESTER.

TO BUILDERS.

The Corporation of the City of Winchester invite TENDERS for the ERECTION of PUBLIC BATHS, consisting of Swimming Bath, Slipper Baths, and Turkish Baths, on land facing North Walls, and Lower Brook-street, Winchester.

The drawings, specification, and conditions of contract can be inspected on and after APRIL 17th, between the hours of TEN a.m. and FOUR p.m. (Saturdays until One p.m.), on application either to the Town Clerk, at the Guildhall, Winchester, or to the Architects Messrs. LANSDALL and HARRISON, 33, Bow-lane, Cheapside, E.C., from either of whom bills of quantities and forms of Tender can be obtained, upon depositing the sum of £5, which will be returned to the depositor upon receipt of a bona-fide Tender.

Tenders (upon the printed form) must be signed, enclosed in a sealed envelope, and endorsed "Tender for Public Baths," and addressed to the undersigned and delivered at the Guildhall, Winchester, not later than TWELVE o'clock noon, on FRIDAY, APRIL 27th. The builder whose Tender is accepted will be required to enter into a bond with two sufficient sureties for the due performance of the contract.

The Corporation do not bind themselves to accept the lowest or any Tender.

WALTER BAILEY.

Town Clerk.

Guildhall, Winchester.
April, 1900.

WHITECHAPEL DISTRICT BOARD of WORKS.

TO BUILDERS, ENGINEERS, CONTRACTORS, AND OTHERS.

The Board of Works for the District of Whitechapel are desirous of receiving TENDERS for the CONSTRUCTION of an ELECTRICITY SUPPLY STATION at Osborn-street, Whitechapel, E.

Drawings may be seen on application to M. W.

JAMESON, Esq., Engineer and Surveyor to the Board, and a copy of the stipulations, specification, conditions, schedule form, bill of quantities, and Tender form may be obtained on payment of a Five Pound Bank of England note, which will be returned after the receipt of a bona-fide Tender and a fully-priced and monied-out bill of quantities and schedule, and the return of the remainder of the documents issued.

Tenders must be enclosed and sealed in envelopes supplied (which are endorsed "Electricity Supply Station"), and must be delivered at the undermentioned address not later than THREE p.m. on TUESDAY, APRIL 24th, 1900.

The Board do not bind themselves to accept the lowest or any Tender.

(Signed) ALFRED TURNER,
Offices of the Board, Clerk to the Board.
No. 15, Great Alie-street,
Whitechapel, E.,
April, 1900.

NORWOOD (MIDDLESEX) SCHOOL BOARD.

The Board are about to BUILD a SCHOOL for 800 Children in the Featherstone-road, Southall, Middlesex and to ENLARGE the present BOYS' SCHOOL in the said Featherstone-road.

Contractors wishing to submit Tenders for same are requested to send their applications to the Board's Architect, Mr. G. E. T. LAWRENCE, A.R.I.B.A., 22, Buckingham-street, Adelphi, W.C., on or before APRIL 21st instant, accompanied by a deposit of One Guinea for each School for which they intend to Tender. The deposit will be returned on receipt of a bona-fide Tender.

The Board do not bind themselves to accept the lowest or any Tender, and may accept any one of two Tenders.

The acceptance of a Tender will be subject to the approval of the Education Department.

A. LAWRENCE HOULDER,
School Board Office, Clerk to the Board.
Southall, Middlesex.
April, 1900.

Can be fixed close up to Purchaser's boundary, and suits rise or fall in the ground.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ERECTION of a POSTMEN'S SORTING OFFICE at East Finchley, N.

Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Mr. J. WAGER, at H.M. Office of Works.

Bills of quantities have been prepared for the use of builders by Messrs. LEE and SONS, of 35, Craven-street, W.C., and, together with forms of Tender, may be obtained at the undermentioned Office on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on FRIDAY, the 20th instant, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for East Finchley Sorting Office."

H.M. Office of Works, &c.,
April, 1900.

COMPETITION.**COUNTY BOROUGH OF CARDIFF.**
PROPOSED NEW ASYLUM.
TO ARCHITECTS.

The Corporation of Cardiff invite Architects experienced in Asylum work to submit their names for selection to send in COMPETITIVE DESIGNS for the NEW BOROUGH ASYLUM to accommodate about 800 patients, and proposed to be erected at Whitchurch, near Cardiff.

Each Architect submitting his name must state in his application his experience and the names of any similar buildings carried out under his supervision, and must also state the terms upon which (if ultimately successful in the competition) he would be willing to undertake the erection of the buildings, including the preparation of all plans, specifications, and quantities, and the necessary supervision of the work.

Applications, endorsed "Asylum Architect," to be delivered at my office not later than TUESDAY, APRIL 17th, 1900.

By order,
Town Hall, Cardiff, J. L. WHEATLEY,
March, 1900. Town Clerk.

The Scottish Local Government Gazette.

For the use of County, Parish and Town Councils, and other Public Authorities.

PUBLISHED EVERY SATURDAY. PRICE ONE PENNY.

The news of all the public bodies in Scotland being reported in the Gazette, EARLY INFORMATION regarding Building and other Contracts can thus be obtained. Being the only weekly Local Government Journal in Scotland, it is the best of all mediums for advertising requisites for public institutions.

Harmonies of Nature.

BENDING ridge-pole and curving roof-tree, with the bellying body of the old tiled roof in between, propped lazily at each end by the twisted half-timber gables! These everyday country sights, so thoroughly English, exemplify effectively Nature's successful protest against the rigidly square and harsh straight lines of constructive modernity. They prove the power of Nature—her superiority over our human geometric laws, over the inherent tendency to compass design by the aid of square and rule alone; and the thought instinctively arises, if we would only take her into partnership what could not be accomplished! On each side of the main mother-roof lean what I will call the offspring, acting almost the part of transcepts to the central line of building. Their green-stained and black-timbered gables stoop backwards towards it; the curving ridge-poles, covered with old silver-grey lead, bending inwards together, and forming a graceful conjunction with the main sweep of the roof. At the far end a low abutment of an irregular hexagonal form, as if rough-hewn out of the solid, makes—to pursue the parallel—a low apsidal finish to the building. There are four chimney clusters breaking the long undulation of the ridges with an inevitable certainty of charm. They do not demand imperiously the attention, as is unhappily the way of modern stacks; there is no self-assertiveness about them, as they slip up quietly into the sky-line and the view. They seem to efface themselves rather than like those new creations, which cut out squarely their legitimate block of sky. These old square stacks, which even smoke, vomit smoke and make a smother gracefully, let the blue background of heaven slip by their crumbling joints, round the red notched edges of the bricks and through the crevices, from where the mortar has departed at the earnest solicitations of the wind and rain, and the numerous years. Their crowns of pots, if there were ever any, have long since departed, and now the stout splay of cement springing from the outer edge of the circling corbelling, is scaling and crumbling in its turn: stained, shaped and coaxed by the weather into a more felicitous curve than was its original. The gables are possessed of long low windows, much like the old weaver windows of Spitalfields, filled with leaded panes bulging with age and so warped that the light catches each diamond differently. Some of the glass has been made good with that of a thick bottle-green quality,

full of faults and shakes such as would drive even a philosophic glazier to desperation. A stone labelling runs squarely round these windows, literally weathered to a perfect moulding by the weather alone, only with this advantage, that with each foot the mould varies—an infinite variation, perhaps, but still there is a difference. I will not attempt the porch, it is inexplicable. How was it possible for such a porch to be beautiful, made up as it is of two leaning walls, some 10ft. apart, of grey-blue stone interspersed with bright red-brick and strung

lichen lingering on the walls, the moss and tiny grass blades delving from between the tile-joints, and the weather-stained aspect, as if the elements had decided to accomplish a piece of enamelling and colour decoration on their own account. The buttresses here and there propping the wall face are more decorative, offering as they do a greater opportunity to the weather artist. Weasels sometimes use them as staircases to the eaves when in search of the rats lurking under the big rambling roof. Starlings and house sparrows are everywhere about it

SOME SPANISH IRONWORK. DRAWN BY F. HAMILTON JACKSON, R.E.A.

together overhead with a rough arching of black timbers on which recline—I use the word meaningfully—the strangest collection of dull red tiles ever seen together. Yet the fact is unchallengeable and the swallows recognise it, for under the eaves, almost within reach of the rosy-cheeked maid who places her butter pans to dry there, are the nests—three or four in number—occupied year after year, and patched, like the old house, most diligently.

Over the whole building the hand of Nature is visibly laid. It is apparent in the

while the house martins have a colony in the eaves. A small company of wrens love the extreme edge of the south gable ridge, and sit staring into the east at sunrise with the starlings circling above them, their dark bronzed plumage showing strange hidden gleams of green in the reviving light. The heavy tiles were originally bedded upon hay, and the wagtails, swifts, and swallows have, after many a summer's diligence, drawn it out in places piece by piece; and then a few of the tiles have loosened, and with the first big wind come scattering down in

shattered ruins under the eaves. Hence a patch of pure vermilion against the dull red area of roof. The moss upon the old tiles, brilliantly green and fresh, the vermilion of the new work, and the old deep tone of the roof, make such a scheme of harmony which it would not be easy for a rival to challenge. Yet it was declared with positive emphasis, previous to Rossetti's great picture, in which vermilion and green had the predominance, that these two colours could never harmonize, which they had been doing ever since English tilers patched English roofs and Nature had her say in the matter.

From behind the building great fleecy masses of golden-red cloud float dreamingly upward, with the red winter sunlight full upon them. They slip along the ridge for a little, and then drifting high into the open azure sea of the heavens pass over the distant elms and black poplars until they finally fade into the hazy Indigo shades beyond. A green shoulder of the upland, projecting round the building, throws into strong relief the hexagonal apse-like finish I have noticed. Its windows are flung wide to the hurrying impetuous freshness of the wind, and within the glistening pans, almost level with cream, can be distinctly seen. A distorted cluster of pines frame the opposite side, bent all one way and stooping in a protective manner over the farthest main gable. Brown twisted tendrils of creeper push upward to meet the pine tresses clearly outlined against the brilliant atmosphere. They are wrinkled and bare, and look really dead contrasted with the brightness all around; yet their splendour of spring is soon to be repeated, and their autumnal glory will assuredly follow. The strangeness and haunting beauty is—in this, that the old comfortable farmhouse is in everything a vital part of, and not an accessory to, the scene. It is at one with the shadowy purple of the trees in the distant landscape, with the sailing fleet of clouds overhead, with the pines, and the elms, and the uplands behind. It is one with the starlings and wrens, the swallows, swifts and the flock of greedy sparrows, the hunting weasel and the hunted rats; they all aid and abet one another to make the charm and assure the beauty. Nature has entered into partnership with man, and the result is unparalleled and past description. At the most it could be drawn imperfectly, but its colour is too illusive and of a far too evanescent quality to be seized by any artist. How could he harmonize that sunburnt tile colour, the patches of vivid vermilion, the moist flashing green of the moss and upland, and the dull yellow of the lichen, the cold blue winter heaven and its golden suite of cloud, with the endless, endless surrounding colours beside. As Thackeray said, by the mouth of one of his characters, you can compel a line to come right, but colour will as it will; you cannot compel the surrounding air; and that is the peculiar quality of Nature, her medium unmatchable by even Tintoretto.

F. B.

On Reflection.

An Architectural Prospect.

THE scheme for inviting a select number of architects to submit designs for the new buildings to be erected facing the Strand, and on the crescent road to be formed between Wellington Street and Clement's Inn, in connection with the great new street, furnished the members of the London County Council with fine matter for discussion last week. The Improvements Committee proposed, and their proposal has now received the Council's sanction, that eight architects should be invited to submit designs, and that they should each receive £250 for their trouble. This at once led Mr. Walter Emden, who is the president of the Society of Architects, to express his opinion in favour of an open competition instead of a limited one, and he suggested that the plans should be put before a consultative committee consisting of the president of the Royal Institute of British Architects, an architect to be appointed by the Council, and the Council's superintending architect, now Mr. Riley. This matter of an open or a closed competition received the Improvements Committee's special consideration, and we think that the decision they came to was the right one, for while an open competition with large premiums may appear to be more catholic, and will give a larger number of drawings from which to make a selection, it is fairly certain that very few, if any, of the leading professional men would enter if one were proposed for the new street, which would most probably result in the best work being excluded. It must be remembered that the recommendation of the committee refers only to the crescent and Strand frontages of the new street, and not to the straight portion leading to Holborn, as these frontages being opposite Somerset House and King's College require special treatment in order that an architectural harmony may be secured. The Council's decision to adopt their committee's idea marks a great change in the metropolitan conscience, for never before have the architectural features of a new London street received similar consideration; Charing Cross Road and Shaftesbury Avenue are dreadful examples of this lack of perception on the part of the authorities. The Council's predecessor, the Metropolitan Board of Works, it is true, submitted the designs of the buildings forming Northumberland Avenue to the Council of the Royal Institute; but this is not comparable to the present case. After the discussion on the main question had been finished with, the question of what materials were to be used for the new buildings caused more dispute. The committee recommended that only stone, marble or granite should be used. Mr. Emden wanted "terra-cotta or any other suitable material" to be added, but this was not agreed to, though eventually the word "brick" was added. The examples in London of the use of terra-cotta are too painful to wish that terra-cotta should be put in contrast with the stone of Somerset House, and we hope that granite will be used most sparingly, if at all.

Are we Artistic?

Is it true that if you only go down deep enough you will find in almost everybody an artistic faculty? Sir William Richmond thinks it is true, but it is to be feared that one would need to go down a very long, long way with many persons—so far down, in fact, that you could never bring your discovery to the surface. To begin with, it is perplexing to define what the artistic faculty really is. If we accept Sir William's definition of an artist as one gifted with keen perception

for all that is beautiful in nature, and not only in nature, but all that is beautiful in thought, we do not think that the artistic faculty is so widespread as he tells us; and it must be admitted that his definition is a good one. In the address he delivered last week on the occasion of the opening of the free picture exhibition at West Ham, a report of which will be found in another column, he says that when he decided not to employ foreign labour in the copying of his designs in mosaic for St. Paul's Cathedral he was laughed at, and was told that he would have to go to Italy for his workmen, there being a firm in Venice which was established in the sixteenth century. But Sir William Richmond put his critics aside and took, haphazard, five or six men "who had never drawn a line in their lives, had been to no drawing classes in Board schools, but had simply received an ordinary education in reading and writing, and they did not show the slightest artistic faculty." These men were taught by Sir William and it is they who have laid the mosaics in the great metropolitan cathedral. But if they have proved so artistic as has been inferred, it is equally reasonable to suppose that they possessed a considerable artistic faculty to begin with. Again it may be asked, does the laying of mosaics require this? We rather think not; it is more a mechanical process, requiring considerable skill and deftness on the part of the workman. Sir William's claim that the fact of these men having done such work was a proof of our artistic merits as a nation needs more support. Sir William was also very enthusiastic and hopeful about our technical schools and said that the conclusion he came to after a tour around the German schools two years ago was that in workmanship the Germans were, perhaps, ahead of us, but in design they were a long way behind. This is very comforting, especially as coming from one who holds so prominent a position in the art world of to-day. We certainly believe that there is a great deal of silly talk about the artistic qualities of the foreigner and our own prosy practicality, and it is a relief when a man like Sir William Richmond turns round the picture and tells us that we have been looking at the back all the time.

A Very Speculative Builder.

THE speculative builder of the ordinary row-of-villas type we all know, but when "a very speculative" one comes under notice it is worth while to consider his methods. One of this type was before the Hull Bankruptcy Court last week and his name is Mr. Arthur Gibson; he lives in De La Pall Avenue, a place where, from its title, one would expect all "very speculative" builders to live. If you go to an unscrupulous company promoter he will tell you that it is possible to start a syndicate having a capital that runs into five figures with a remarkably small amount of money—that is, real money. Other persons who set up in business for themselves find that they need considerable capital to do any good. Mr. Gibson says "No." According to him, £10 will set up any speculative builder, and, in fact, that is what his capital was when he began his building operations in 1896—and this £10 he borrowed from his wife! It is a pity that he gave the opinion in a Bankruptcy Court, for it was there shown that his liabilities were £2,528 8s. 4d. and his assets £384 15s. 5d., which is not inspiring. He said, with delightful irony, that he did not always make a profit on his business, and at the time when he bought his wife a piano-forte, a gold watch, and a sham gold bracelet he was earning £2 a week. It may be mentioned incidentally that he was then keeping two horses and a groom. How some people live is wonderful!

PORTION OF CHAPEL GRILLE, TARRAGONA CATHEDRAL.

SOME NOTES ON SPANISH IRONWORK.—II.

(Concluded from page 165, No. CCLXX.)

By F. HAMILTON JACKSON.

A PART from the work on doors and around windows and balconies, the outdoor ironwork of the north of Spain does not much strike the eye. The towers of churches are sometimes crowned with an ornamental iron staging which supports two or three bells, light and delicate in effect, though actually strong and massive, and outside some of the cathedrals there are railings a good deal ornamented, in the manner of the one drawn from Toledo (see Part I.). But one does not see the elaborate well-heads and the railings around fountains and wells which are so common in Germany, though in court-yards one finds every now and then such work as the well-head drawn from Segovia (shown on the next page). That drawn from the cloisters, Tarragona, is on the terrace above the ambulatory, from which the dwellings of the canons open, and is no longer in use. It probably replaced one of earlier date. But it is within the ecclesiastical buildings that the most noticeable pieces of ironwork are to be found. Among these are the pulpits which are to be seen in every parish church, and of which the cathedrals possess two, one on the gospel and one on the epistle side of the *capilla mayor*. They are generally gilt either wholly or in part and are of all grades of simplicity or ornateness. The one from Corpus Christi, Segovia (see page 181), is an example of the simplest form, and that from St. Nicolas, Burgos, is a slightly more elaborate treatment of the same motif, spindled balusters set in an upper and a lower rim; but many of them are made of a rigid iron framing with repoussé panels filled with arabesques, of which an example may be seen at Las Huelgas near Burgos, the pulpit from which St. Vincent Ferrer preached. To this there are no structural steps, entrance being obtained by means of movable ones. Another with pierced panels is figured by Street from S. Gil, Burgos, and in the cathedrals the workmanship becomes most elaborate, the relief being considerable and the designs (which embrace figure subjects) chased and chiselled so elaborately as to rank among works of sculpture rather than of ironwork. There are two in Avila Cathedral which have been often drawn; one elaborately pierced with tracery of Gothic character, the other of a later date equally elaborately repoussé with figure subjects. These later pulpits are very difficult to distinguish in the dim light of the cathedrals from those worked in bronze, which shows to what a high pitch the working of iron had been brought in Spain.

The lecterns are often very fine works of art; one at Toledo which is wrought in mixed metals and much gilded may be specially mentioned. It consists of an eagle standing upon a Gothic tower, the niches of which are filled with beautiful little figures. Three steps, defended by a railing, ascend to a little platform behind the eagle, and round the base,

and resting against the flying buttresses of the tower and the little lions which serve as feet, are great choral books, bound with heavy bosses and with corners of silver and brass, making a most picturesque pile in the dim light of the choir. Less imposing lecterns are sometimes to be seen inside chapels—such as the one drawn from Burgos, which folds for convenience of transport. Candelabra are numerous but are rarely made of iron. Most of them are plateresque in style, and here again the dim light makes it difficult to properly appreciate the beauty of workmanship and fanciful design which characterise them. A few of more ancient date are to be seen here and there, one of which is drawn from Tarragona, the bulk of which is very quaint and curious. The greater part of this is forged without being touched after it was cold as far as I could see, though the candle sockets and the lamp at the top appear to be later additions. It was in a rather dark chapel behind the choir, in which was a dead

Christ, fine in feeling and well carved, and bore several lighted votive candles. It is more usual to find the Virgin's shrine blazing with tapers and surrounded by worshippers, while that of the Christ is left solitary and dark.

Before entering on a description of the most elaborate works of the Spanish smiths, it may be as well to recall the difficulties which must always accompany working in iron, as well as those special difficulties which the mediæval smiths had to encounter, which made some of those tasks that are now quite easy among the most difficult which they had to accomplish. Without pretending to write full notes upon the manufacture of iron, two or three points of difference may be mentioned. The Catalan forge has been already referred to. This was a rectangular hearth in a permanent building without a chimney, but with a hole in the roof. The furnace was made up and renewed with alternate layers of sifted ore and fuel upon a layer of charcoal 18 in. deep, the blast being obtained by manual labour. Ten men were employed to each furnace, and after six hours of the blast the iron was found separated, and was manipulated until it coalesced into a lump at the bottom. It was then lifted by levers over the edge of the furnace and hammered, at first by hand but later by helve-hammers weighing from 1,200 lbs. to 1,500 lbs. or more. These were worked by a rough cog-wheel driven by water power in England, and were used to beat the rough "bloom" into bars on a slightly tapering anvil. The name "Hammer pond," so common in Surrey and Sussex, indicates the water power used in such a manufactory. As long as charcoal was used for smelting, malleable iron could be produced direct from the ore and in contact with the fuel; the mediæval and much of the Renaissance iron was so produced. Before the invention of rolling mills, grilles made of plain upright bars, whether of square or circular section, were the most difficult

things which a smith could have to make, the equality of thickness and regularity of shape having to be produced from the rough ingot solely by hammering. At the same time such grilles served the purpose of protection better than any other, being quite unsurmountable without ladders, and one frequently finds them either quite plain or ornamented with twistings at regular intervals like one of those in the cloisters at Burgos (see previous article). This twisting, by the bye, besides being a very decorative addition, adds greatly to the strength of the iron while absolutely increasing the appearance of lightness. It will easily be realised that while in a square bar the resistance at the centre of each side is only that of the diameter,

able richness of effect at small cost of labour. The secret of preparing dies of steel or chilled-iron was certainly known in England in the thirteenth century, and also in France, and it seems probable that the smiths who made the screens near Madrid, which show French influence so strongly, may have brought the knowledge into Spain, where the same mode of working iron was made use of at a later date in the production of the great *rejas*. The black-smith's art resembles that of the glass-blower in that there must be no hesitation or delay on the part of the worker. As the material cools it loses plasticity; the shaping must be done with rapidity and decision; the planning and thinking out which every

screens which Spain alone produced: "The ironwork became of so grand and impressive a character as to confound all our previous conceptions of the capabilities of the material. The limits that its stubborn nature and the technical difficulties of the craft seem to impose are disregarded, and in contemplating the colossal *rejas* or screens in the great Spanish cathedrals it is hard to realise that effects in iron must be got swiftly by the hammer and punch while the iron is hot, or tediously by the file, chisel, and drill while it is cold. Hitherto spindled balusters with mouldings had rarely been attempted in hammered iron, or merely produced in twos or threes, but in the screens and railings of the later plateresque we find them in ranks and rows, and, literally, in thousands. They actually appear commoner than plain rectangular bars, and, as if to excite greater astonishment, whole rows of them are embellished with foliage carved out of the solid. Human figures, so rarely attempted by the smith, except in minute size, are not merely introduced singly or in pairs, but in multitudes, and the master ironworkers have not hesitated to attempt even the portrayal of scenes and historical events. The character and execution of the figure work make it impossible to believe that those who produced it were only smiths, and we find, in fact, that the masters who signed their names to such magnificent productions are spoken of by contemporaries as sculptors and architects, and were in two or three instances in holy orders. They were, indeed, artists of the highest rank."

The cloisters of Barcelona Cathedral are surrounded by chapels on three sides, and these chapels are shut in by iron grilles. Barcelona possessed a guild of ironworkers as early as the thirteenth century, so that there was hereditary dexterity to count upon when, in the fifteenth century, the cathedral was completed. At that time numerous screens were made for the chapels inside, which bear a certain resemblance to each other, being for the most part finished with a cresting of spiky liliaceous leaves, which are characteristic of Spanish smithing of that date. Some of the screens in the cloisters have the same cresting, but those that I have drawn appear to me to be framed on a rather earlier tradition. They show a mode of work in which the Spaniards especially excelled—I mean the mingling of solid forged parts with others cut and pierced from thinner metal, sometimes also punched and repoussé, like the ornamental panels from the grille at Burgos already illustrated. The rosette and twisted border pattern surrounded the two doors of several grilles which were made of rounded bars, a noticeable peculiarity, for they are more commonly square, set angle-wise, at this period. The architectural-looking gate struck me as very good in every way, the forms being modified to suit the working of the material while still recalling and harmonising with the surrounding architecture.

There was considerable mingling of styles in Spain during the early Renaissance, and the latest Gothic was still used in ecclesiastical buildings after the Renaissance was generally adopted in domestic architecture. In Burgos Cathedral the change can be well studied—the *reja* of the chapel of S. Ana has a very Gothic appearance; the next chapel "of the Presentation" shows the Renaissance feeling strongly although the component parts are practically the same; that is, the construction remains the same while the decoration changes its style. A little further in the Capilla del Condestable the upper part of the *reja* is differently constructed.

The great *rejas*, such as those of Burgos and Toledo, were sometimes 30ft. or 40ft. high and their construction was as follows:—The spindles and framing bars were forged in the solid, the ornamental parts being apparently struck into dies and finished afterwards with chasing. Viollet-le-Duc maintains that some of the German work of a somewhat similar kind was made of repoussé leaves, attached to the solid spindle round their edges, which seems a difficult, if not impossible, manner of producing the effect; but the Spanish work appears to be solid. The square or rounded pilasters and the cornice work, which are always so beauti-

designer must bestow upon his work being completed before the execution commences, though in matters of detail suggestions may often be taken by a clever man from accident or incompleteness. The operation of welding again, upon which the stability of smith's work depends so much, requires great skill and dexterity. The welding point is the highest degree of heat which the iron will bear without burning or disintegrating, and in complicated forgings, such as the elaborate hinges of some of the French doors, the greatest management and foresight were required. The putting together of the smaller pieces so as to make larger groupings, and the arrangement of the joinings of the larger branches so that the weldings should not require the application of the greatest heat several times in the same place, demanded great skill and judgment, some portions of the work requiring to be made white hot while others were only cherry red. Add to this the difficulty of manipulating large and heavy forgings, and it will be seen that to become a successful smith demanded great qualities of head and hand, almost justifying Mr. Starkie Gardner's contention that the quality of the smith's work and the amount of its use may be taken as a measure of the virility of the nation. I quote a fine passage from his book on ironwork, which refers to the magnificent

and at the angles that of the diagonal, if the bar be twisted so that the angular diameter revolves the strength is increased by the difference between the length of the diameter and the diagonal, whilst the apparent thickness in a perspective view of the bar is diminished, as one no longer has a continuous view of two sides at the same time. The Renaissance *rejas* were developed from these upright barred grilles, the essential portions of construction being ornamented, sometimes, perhaps, in the later work a little over-ornamented.

The tools of the smithy proper consist only of hammer and anvil, forge and bellows, tongs, chisels, and punches or dies. The last are used either to strike on to the hot iron or to strike the iron into position, thereby gaining consider-

fully repoussé, are made with wooden cores, upon which the angle mouldings are nailed (such mouldings being equally made of thin metal), the thin repoussé plates of ornament, which are often in quite small pieces, being made to overlap the lower parts of these mouldings so cunningly that in the obscurity of the cathedrals it is most difficult to see how the effect is produced. The crestings, which are so splendid a feature, were also made of thin iron repoussé to a considerable curve, so that figures of angels appear fairly completely modelled, though made in two halves and put together over a core which of course is supported by an iron framing that passes up the centre. The candelabra and large pieces of scroll work are put together in the same way. The top of the screen from S. Juan dela Penitencia at Toledo is a modest work of this sort, which can therefore be more easily examined, though the actual grille bears a great resemblance to some of the balcony panels which have been illustrated. Sometimes in the earlier grilles long pieces of thin metal are pierced in a lace-like fashion and very slightly repoussé, and in this case they are riveted at intervals to supports which have a square hole in them, intended to slide over one of the main bars of the grille, being stopped either by a wedge or a projecting rivet; but in the Renaissance *rejas* the plates are all repoussé in the purest Italian taste and in the most perfect manner, the relief being sometimes very high, and always chiselled a great deal after becoming cold. In this place mention must be made of the staircase to the north door of Burgos cathedral, so finely wrought by Cristobal Andino about 1520 from the designs of Diogo de Silve, the metal part of which consists of panels containing elaborate arabesques and medallions which ramp with the stairs, worked with the same delicacy and beauty which characterise his *reja* for the Capilla del Condestable.

Doors are frequently strengthened with plates of iron cut into curious shapes and nailed on, as was noted when speaking of knockers. A few drawn from various towns were given last week. The door of S. Maria del Mar at Barcelona is covered with similar plates which form an openwork pattern, among which are inserted some figures of labourers which are said to record the fact that workmen contributed to the funds for the completion of the church. At Tarragona are to be found examples of a very complete sheathing, the old church of S. Tecla la Vièja having a door covered with overlapping plates nailed on with copper nails and with ornamental bosses of bronze, a form of ornamental strengthening which was adopted in the sixteenth century for the west door of the cathedral, the design of which was more elaborate but evidently suggested by the earlier work.

In bringing these notes to a close, I should like to lay stress again upon what seems to be the special aptitude which the Spaniards have shown for ironwork—which is shown not only by the magnificent *chefs d'œuvre* produced by the most celebrated smiths, but by the fact that the tradition of good design lasted so much longer than it did in other countries; and by another fact to which I have not yet referred, namely, that side by side with the wrought ironwork, which has been the subject of these notes, cast-iron was produced showing just as complete an appreciation of the qualities which should govern design in that material. Among other things which I saw, I may mention some rain-water pipes at Burgos which were covered with excellent ornament, because afterwards, at Segovia, I saw pipes of the same design but with the mark of the foundry at that town where they are still made.

Proposed Ruskin Memorials.—It is proposed to erect an early English cross at Friar's Crag, Derwentwater, to the memory of John Ruskin. A petition has also been presented to the Dean of Westminster asking for permission to place a memorial of Ruskin in Westminster Abbey. The Dean has given his hearty consent to the proposal, and has provisionally allocated a site for the memorial.

BUILDING STONES AROUND LIVERPOOL.*

I.—By ERNEST C. ALDRIDGE.

THE subject of building stones is rather a ponderous one, as we have to do with questions of fact rather than with matters of opinion, and I have found that some knowledge of the science of geology is necessary in order to use the facts in an intelligent and practical manner.

I propose first to deal with a geological map of the British Isles. On it are tabulated the various formations (consisting of London clay, oolite, new red sandstone, magnesian limestone, carboniferous system, old red sandstone, schistose system (quartz and mica) and granite), and the localities where these formations occur are coloured to correspond. On consulting the map with a view to the local formation, we find that practically the whole of Cheshire and a good half of Lancashire, including all the basin of the Mersey, is coloured the same tint, which indicates new red sandstone. This consists of a large series of reddish-coloured shales and sandstones resting on the carboniferous rocks, and so-called to distinguish these strata from the old red sandstone, which is similar to them in mineral structure but lies below the coal measures. The only exception to this formation occurring in Cheshire is a small patch on the banks of the Dee, round Neston, where the coal measures crop out.

The half of Lancashire which is not new red

* Papers read before the Liverpool Architectural Society on March 19th, 1900.

sandstone lies to the north-east of Liverpool, through Wigan, Bolton, Bury, Rochdale, and forms a part of the great carboniferous system of the country, which starts in the Midlands and runs up due north through Derbyshire, Yorkshire, Durham and Northumberland.

I have selected a small map of the district by Mr. G. H. Morton, F.G.S., to help us. His book on the "Geology of the Country around Liverpool" is very interesting and useful. To go with this map I have prepared a section showing the formation in south-west Lancashire and Winal.

	Drift Sand.	
	Recent and Post-Glacial.	
	Red Marl.	Keuper
	Keuper Sandstone.	
	Upper Soft Sandstone.	Bunter
	Upper Hard Sandstone.	
	Lower Hard Sandstone.	
	Lower Soft Sandstone.	Carboniferous.
	Permian.	
	Upper and Middle Coal-Measures.	
	Lower Coal-Measures.	
	Millstone Grit.	

I propose to take the strata separately, trace them to the surface, note their appearance and peculiarities, try and find out their qualities as building stones; and lastly, give

Candelabrum

Tarragona Cathedral.

Burgos Cathedral

Stay of Folding Forms

a list of some of the buildings where they have been used, and note the weathering qualities they have displayed.

Carboniferous Strata.

Beginning with the lowest subdivision on our section of the new red sandstone of Lancashire and Winal, we come at once upon a building stone. It is the carboniferous sandstone which always accompanies and underlies the coal measures, and is called *millstone grit*. As the name implies, it is an exceedingly hard carboniferous sandstone, with both coarse-grained

from Cefu, near Ruabon, though here the grit is softer and more easily worked.

Speaking of our two local quarries, the thin beds from Upholland are made up into rock-faced bricks, 3in. to 6in. thick, called "shoddies." Any quantity of this work may be seen about Liverpool, usually in churches and chapels, the colour often being a dirty khaki, which is fashionable enough just now but does not look well made up into churches. Sometimes the shoddies are grey, and look rather well with bands of dressed stone—perhaps red. I cannot name any building of

and carbonate of magnesia in nearly equal quantities; very durable, and fit for carvings, mouldings, and the finest ashlar work.

Bunter Strata.

We now come to the strata which are of the greatest consequence to us, for the Keuper and Bunter, the two main divisions of the trias, provide the whole of our local freestone. It is necessary also to know their sub-divisions, the lower soft sandstone, the lower hard sandstone, the upper hard sandstone, and the upper soft sandstone of the Bunter (the two middle ones being known as the pebble beds and producing building stone), and the Keuper sandstone and red marl belonging to the Keuper.

To examine this series in detail we will begin with the *lower soft sandstone* of the Bunter. It consists of bright or orange-red and yellow sandstone, sometimes so soft as to be obtained in the condition of sand, but now and then quite hard, though I believe never fit for building purposes. The lower soft sandstone occurs over a considerable area between Old Swan and Huyton, Prescott, St. Helens, and Rainford, and in the Winal at Eastham and Burton Point, near Neston, where there is a very fine exposure. Of course it is quite likely that this stone is used locally for walling and in cottages, &c., but it cannot be called a building stone on that account.

The *lower hard sandstone* of the Bunter is of importance, as it provides quite one of our best building stones. It is a hard brown-red stone, separated into beds (6ft. to 10ft. thick) by bands of grey, and may often be found variegated. It contains pebbles of quartz and grit in great numbers scattered through the stone, which gives it the name of pebble beds. Some of the beds, however, are almost entirely free of pebbles, and these provide our building stone. That with pebbles does very well for the jerry builder's heads and sills. The most important exposures in the Winal are Hilbre Island, Middle Island, and Little Eye, all of which are composed of the lower hard sandstone, and on the Lancashire side round Wavertree, Woolton, Speke and Rainhill, each of which has its quarries. Those best known are Rainhill and Woolton, which produce a really excellent red stone suitable for carving or fine ashlar work. I consider the variegated stone from these quarries very handsome, and believe that it can be used for interiors with very good effect. The Woolton white is the best white stone we have, but most unfortunately it is only obtainable in very small quantities. It was used in the Wavertree Clock Tower, built in 1884 by the late Sir J. A. Picton, the stone for which, he says in a letter, was obtained with difficulty. Fenwick Chambers in Fenwick Street are also of white Woolton. I am told the red stone used in the Liverpool Stock Exchange is from two beds in the Woolton quarries.

The *upper hard sandstone*, or upper pebble beds, also produce a building stone. In colour it is a dull red with grey streaks up to a foot in thickness. It is particularly well exposed in the Edge Hill Railway cutting, where it presents a solid bed of hard sandstone without any seams of shale dividing it up. The Mersey tunnel is contained entirely within the limits of this subdivision. There have been several quarries of it on the northern and eastern sides of Liverpool, where it has been largely used for building purposes, particularly in dwelling houses. The stone from the Lime Street cutting was used up in the buildings in the neighbourhood of Edge Lane. The principal quarries producing this stone (which is suitable for interiors) are two large ones in Hawthorne Road, Bootle. Christ Church, Waterloo, is lined with a variegated stone from these quarries and the effect is very good.

We now come to the highest subdivision of the Bunter, the *upper soft sandstone*. Sometimes this is of a bright-red colour, with interbedded streaks of white or grey, but often the upper beds are of a bright yellow resting upon the red beneath. The stone is very well exposed in its two colours at the famous "red and yellow noses" at New Brighton, while the red variety may be seen

Portions of
Grilles
Cloisters
Barcelona

and fine-grained varieties. In colour it varies considerably, white, yellow, brown, and red being found, as well as a coarse grey variety, which often weathers to a light brown colour. The nearest important exposure of the millstone grit is at Upholland, about twelve miles from Liverpool, while there is a much more extensive one at Parbold, sixteen miles from Liverpool and six from Wigan. From the description you will probably have recognised its similarity to "York" stone, and, indeed, they are one and the same, both belonging to the carboniferous system and cropping out from below the coal measures. The grit is very largely used in steps and landings on account of its hardness, and is extensively employed for building purposes on account of its lasting qualities. In Liverpool millstone grit has been used in St. Luke's Church (erected 1830), in St. George's Hall (erected 1850), in the Municipal Offices (erected 1867), and in St. George's Church; while the Free Library and Museum (1859) and Walker Art Gallery (1877) are of similar coal measures

dressed stone from these local quarries, but Parbold yields an excellent white building stone. The thin beds of grit from the neighbourhood of Upholland provided the stone slates used in old Liverpool, and still to be seen in the country outside, and are now used for flags and curbstones, and the waste for road metal.

The coal measures form the upper part of the carboniferous division; their thickness is very great, exceeding 4,000ft. The nearest exposure of the middle or productive subdivision occurs round Prescott and St. Helens, and produces one of the finest crops of chimneys in the country.

The *permian bed* comes next, separating the carboniferous system from the new red sandstone. There are only one or two small exposures within our radius, and these yield no building stone. The permian system is of importance, however, for the Mansfield stone—one of the most celebrated building stones in the country—is found in it. The Mansfield is a dolomite, that is, with carbonate of lime

in the cliffs at Dingle Point. Like the lower soft sandstone, which it resembles in character, this subdivision is unfit for use as a building stone except in the humble capacity of rubble walling, gate piers, copings, &c.

Keuper Strata.

The Keuper succeeds the Bunter formation in ascending order and is probably, from an architect's point of view, the most important of those we are now dealing with.

It is divided into two subdivisions, the Keuper sandstone and the red marl. The Keuper sandstone varies considerably both in colour and microscopic character. Sometimes it is of a good light red, as at the celebrated quarries of Runcorn, Frodsham and Heswell; sometimes it is yellow, white, or grey, as at the well-tried quarry of Storeton. Under the east and north of Liverpool the stone is of the white and yellow variety, closely resembling that at Storeton, while under the south end it is red, resembling that at Heswell and Runcorn. The lower beds of white and yellow were well exposed and extensively quarried along the rising ground on the east of the city, and to a very large extent provided the building stone used in its gradual growth until at length the building area spread over the quarries themselves, and hid them from view. The most notable instance of this is St. James's Cemetery, the site of which was formerly a large quarry of yellow keuper sandstone, and provided the material for several important buildings in the town, notably, St. Thomas's Church (1750), the Town Hall, except portico (1754), and St. Paul's Church (1769). Of these, the town hall stone was probably obtained from lower beds, for it has resisted decay much the best, and far better than most buildings out of this quarry, for which we are duly thankful; especially so when we see the sad state of St. Thomas's Church, built only four years before with stone from the same quarry. As a rule, this St. James's stone begins to crumble away after fifty or sixty years.

A celebrated old quarry of white Keuper was situated in Rathbone Street (just south of St. James's Cemetery), and provided the stone for the Great George Street Chapel (1841), the columns in front of which are, I believe, the finest monoliths in Liverpool. The portico, too, of the town hall, which was a later addition, is out of Rathbone Street quarry, and I consider the columns forming this portico have weathered into one of the most striking architectural features of Liverpool.

Another of the main quarries of old Liverpool was Brownlow Hill, now the site of the Liverpool College. The Keuper from here was mainly red, resembling Runcorn, and was very largely used as a building stone. Several quarries at the top of Mill Street, Park Road, of both the white and the red stone, were being well worked about forty-five years ago, and provided the stone for many buildings in that neighbourhood, one of the best known being St. John the Baptist's Church, Park Road, which shows unmistakable signs of decay to-day. But this, although most interesting, is ancient history, and we must push along to consider for a short time our present-day quarries producing building stone.

Liverpool Quarries.

At Storeton the lower beds of the Keuper are more fully exposed than anywhere in the country around Liverpool. The stone quarried is of a white, cream, yellow, or pink tint. I am afraid we shall have to speak of Storeton in a past tense, as it has seen its day and is getting pretty well worked out.

It is quite likely that this stone will work up all right for ashlar walling, or two-faced work, but probably would not for three or four-faced work. What has the quarry done for us in the past? and how is the work standing? The Custom House, one of our most important public buildings, erected in 1828, is chiefly of Storeton stone. Here the stone seems to have weathered fairly, but strikes me as not being a very good sample on account of the great number of small holes, often in very prominent places. The Wellington

Column was quarried at Storeton (its date is 1863), whilst among a host of other buildings built of this stone are the Liverpool Institute (1835), the Philharmonic Hall (1845), and the Birkenhead Town Hall (1883).

With Storeton we will leave the white keuper, and look for a minute or two at the red variety. The principal quarries and those best known to us are Heswell, Frodsham and Runcorn. In colour, the stone is a light red. The lower beds produce a good building stone, that from Runcorn and Frodsham being more durable than the Liverpool or Storeton stone. Mr. Norman Shaw used the Heswell stone at "Dawpool," the beautiful house built for the late Mr. Ismay. Along the high road from Caldy to Thurston will be noticed several small quarries of this red stone, which is no doubt used as dressings in the houses in this neighbourhood, one which is rapidly becoming a favourite residential district. Runcorn, like Storeton, is a well-tried quarry, and has produced some really good building stone. The old Liverpool College in Shaw Street, St. Cyprian's Church, Edge Lane, and the handsome Turner Memorial Home are of Runcorn stone.

I am told that an excellent stone is being quarried at Helsby, even better than that now coming from Runcorn. If this is the case it is probable that they are working in indifferent beds at Runcorn, whilst the best beds are just now being worked at Helsby. Rivington in his third volume supports this view, for he says of Runcorn "that it is a good and bad stone in alternate layers." All quarries turn out stone of differing quality from time to time as they work the different lifts, so that where there are several quarries of the same (as at Woolton, for instance) it is quite a good thing to pay them a visit—or send your clerk of works—and then specify that quarry producing the stone which best suits your requirements.

Well, that completes the list of the sandstones around Liverpool. To sum up what I have said, the fact has to be admitted that we are not able to boast a really superior building stone in this neighbourhood. We see this by the increasing number of buildings which were erected with stone from distant localities as railway facilities improved. Limestones from Ancaster, Bath, Hopton Wood, and Portland; grits from Darley Dale, Minera, and many parts of Yorkshire; and sandstones from Mansfield and Cefu, have been introduced in the place of our local stone.

Again, is not the supply of such building stone as the neighbourhood provides failing us? The quarries of St. James's, Brownlow Hill, Rathbone Street, and Mill Street, beside many others less known, are now built over and forgotten. Storeton we fear is getting worked out. The white Woolton, which was a beautiful stone of excellent quality, is unobtainable now, except in small quantities; while just at the present time, I am told, the Runcorn quarries are producing a rather indifferent stone. What have we left? Of those within the range of my present paper, and not counting Cefu or Minera, I should place the lower hard sandstone from Rainhill and Woolton first, and the Keuper from Runcorn and Helsby second, amongst the red and variegated; whilst, for a white stone, we should have to make the best of Storeton.

II.

By A. W. STREET.

THE building stones around Liverpool largely consist of sandstones, but limestones, granites and marbles from all parts of England are used for building purposes in and around the city.

Sandstones.

Sandstones generally consist of grains of silica cemented together by various materials, of which silica is the most durable. The durability of a sandstone depends upon the cementing material and its presence in sufficient quantity to form a homogeneous mass. Thus,

a heap of loose sand, practically composed of little else than pure silica, would be valueless as a building stone, though perfect according to chemical analysis. Sandstones are found in great variety of colour—white, yellow, grey, greenish grey, light brown, brown, red, dark blue, and even black. The colour is generally caused by the presence or absence of oxide of iron. Some persons consider coarse-grained sandstones most durable. This, however, seems doubtful, for some fine-grained varieties weather better than the coarse. The hardest and best sandstones should be used for important ashlar work, and the finer-grained stones for carving, &c. The principal sandstones of the Liverpool district are obtained from the quarries at Storeton, Woolton and Runcorn. Storeton stone is an even-grained compact stone, easily worked and durable. It is white and light red in colour. Storeton quarries are well worth a visit, for it is here, in the close proximity of the quarry, where a good idea of the weathering properties of the stone can be obtained by a careful examination of the bare faces of the "old quarries" which have stood the weather for ages. Runcorn and Woolton stones are very similar to Storeton. Woolton is dark brown in colour, and Runcorn is red. Both these stones are very suitable for Liverpool. They weather well, even in the smoky air of the town.

The Sailors' Home, Liverpool, and the basement of the "Daily Post" offices in Victoria Street, are constructed of Woolton stone. This shows no sign of disintegration and has weathered admirably. The Exchange Buildings, and the Philharmonic Hall are very good examples of the durability of Storeton stone. Hollington stone is also used in the Exchange Buildings and it is so like Storeton that it is impossible to distinguish them. St. Sylvester's Church in Scotland Road is built of Runcorn (outside) and Storeton (inside). It has weathered well and makes a very good job.

Limestones.

The term limestone is applied to any stone the greater proportion of which consists of carbonate of lime. Chalk, Portland stone, marble, and other varieties of limestones consist of nearly pure carbonate of lime, though they are very dissimilar in texture, hardness and weathering qualities. The carbonate of lime in these stones is of course liable to attack from the carbonic acid dissolved in the moisture of ordinary air, and is in time destroyed by the more violent acids and vapours generally found in the atmosphere of large towns. The best weathering limestones are dense, uniform and homogeneous in structure and composition, with fine grains, and are of a crystalline texture. Some limestones consist of a mass of fossils, either entire or broken up, united by cementing matter. Others are entirely made up of round grains of carbonate of lime, generally held together by cement of the same material.

Portland stone is one of the finest limestones to be obtained for general building purposes; that is, if you happen to obtain the white-bed and not the basebed, for the weathering qualities of the latter are greatly inferior. Basebed is fit only for internal work, and great disappointment is caused when it is used, mistaking it for whitebed, in external work exposed to trying atmospheres. The carver, however, prefers basebed, though it is not so durable, because it looks better and is more easily worked. The Law Courts in Victoria Street, Liverpool, are a very good example of how a Portland stone building will appear when it has stood a great deal of weathering. If you take particular notice of the mouldings, cornices, and especially the coping to the area; you will find that the acids floating about in the air have eaten away the underside of these mouldings. The coping to the area is like a piece of pumice stone in appearance; this is, of course, the result of disintegration. Portland stone is also used in the White Star offices, and the new Post Office.

Bath stone is well-known, and is sometimes used in Liverpool, but not with very good results, for it is one of the worst stones possible

for building in smoky districts. It is quarried in summer only, for it would fall to pieces in winter owing to the action of the frost. It contains so much quarry sap that it takes about two years to get rid of this. It may be used for interior work with good effect, but it should not be used for exterior work in the North. As an example of the effect of the weather on a building of Bath stone, examine the Unitarian church in Hope Street and you will find that one side of the building is almost black, and in many parts disintegration has got a firm hold. The boundary wall, in particular, has suffered badly. Although this stone weathers so badly in the town, or near it, it nevertheless makes a good building stone for the country; in fact, most limestones do—that is, if they are kept clear of any bleaching factories. St. Agnes's Church, Ullett Road, is another building where Bath stone has been used with the same results.

Ancastr stone is largely used in Liverpool. It is a very compact, fine-grained stone, and becomes harder after it is quarried. It is white, yellow and pink in colour, and very durable. The Central Station is built of this stone, and is very satisfactory.

Granites.

Granite consists of crystals of quartz, felspar and particles of mica. The quartz is a very hard, glossy substance in grey or colourless amorphous lumps, occasionally in crystals. The felspar should be crystalline and lustrous, not earthy in appearance; its grains are of different shapes and sizes, and their colour may be white, grey, yellowish-pink, red or reddish-brown. The mica is in dark grey, black, or brown, flexible semi-transparent glistening scales, which can easily be flaked off with a knife. The colour of the stone depends upon that of the predominating ingredient, felspar. The durability of the granite depends upon the quantity of the quartz and the nature of the felspar. If the granite contains a large proportion of quartz, it will be hard to work; but, unless the felspar is of a bad description it will weather well. Mica is easily decomposed, and it is therefore a source of weakness. The elements of decay in all granite are potash, felspar, mica and iron. Hornblende sometimes takes the place of mica in the composition of granite. Where it is the main ingredient the granite is called "syenite." Granite like most stones is absorbent; it contains quarry sap when first quarried, and is then easier to work than when it is dry. Close-grained granite is more uniform in wear than the coarse varieties. Large masses of felspar are an element of danger in a granite. Any felspar having an earthy appearance is untrustworthy, and felspar, to be good, should be crystalline in appearance. Iron is easily seen in the "grey" varieties. On exposure to atmospheric action rust stains are observed, and an addition of a small proportion of nitric acid enables the presence of iron to be detected with greater care.

Peterhead granite is composed of red felspar, black mica and quartz. It takes a good polish is fairly durable and make a good ornamental granite. The columns in the large hall of St. George's Hall are of the granite. The Church Street branch of the Bank of Liverpool is either of Peterhead granite or of a similar granite.

Shap Fells granite has large flesh-coloured crystals of felspar, reddish-brown in colour, and it takes a very good polish. It is used in the "Junior Reform Club" in Dale Street and the "Don" Association buildings, Paradise Street.

Dalbeattie granite is grey in colour, is very durable, and has a good appearance. The docks at Liverpool and Birkenhead are largely built of it. The "White Star" offices are built of this or a similar granite.

Chemical Composition of Stones.

The chemical composition of a stone should be such that it will resist the action of the atmosphere and of the dangerous acids, which, especially in large cities, the atmosphere often contains. These destroying substances are collected from the air by the rain and driven into the pores of the stone. The sulphur acids, carbonic acid, hydrochloric acid, and

traces of nitric acid in the smoky air of the towns, and the carbonic acid which exists even in the pure atmosphere of the country, ultimately decompose any stone of which either carbonate of lime or carbonate of magnesia forms a considerable part.

The oxygen even in ordinary air will act upon a stone containing much iron, and the fumes from bleaching works and factories of different kinds very soon destroy stones whose constituents are liable to be decomposed by the particular acids which the fumes respectively contain.

In addition to the direct chemical action of the sulphuric and sulphurous acids upon the constituents of stones, sulphates are sometimes formed by them, which crystallise in the pores of the stone, expanding and throwing off fragments from the surface. The durability of a stone depends, therefore, to a great extent upon the relation between its chemical constituents and those of the surrounding atmosphere. A stone which will weather well in the pure air of the country may be rapidly destroyed in the smoky atmosphere of a large town.

Correspondence.

Damp Walls.

To the Editor of THE BUILDERS' JOURNAL.

IPSWICH.

SIR,—With reference to the reply to the query about damp walls on page 154 of your issue for April 4th, the only remedy would be to rake out all the joints in the brickwork, thoroughly wet and brush same in order to remove all superfluous dirt, and apply a uniform thickness of Portland cement stucco. I can guarantee querist will then experience no further trouble from this source, providing the work is done with approved materials and by a practical man. Tile hanging or slates may be suitable for plain surfaces to a certain extent, but it is difficult to cope with damp round reveals, doorways, &c.; there is also the possibility of one tile becoming detached or broken, which, if neglected, will cause the grounds on which the tiles are hung to decay and so make a greater evil than existed before their use. In order to further improve the damp-proof qualities of stucco executed in Portland cement, it should be painted a year after it has been finished, and then annually.

W. H. H.

Unlovely London.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, W.C.

SIR,—Referring to the articles which have appeared in your columns on this subject and touching on the question of æsthetics, I take it the question is not so much "What is lovely" as what is decidedly unlovely, and how matters in this respect can be improved. Everybody will admit that there are certain things which are unlovely, such, for instance, as dirty streets and "groggy" lamp-posts, and the railway bridge at Ludgate Circus which obscures the view of St. Paul's. Undoubtedly we might learn much from the French that would help us to improve our city if only in the matter of sculpture. Even in Trafalgar Square some of the monumental sculpture is of a very poor character considering the greatness of the heroes. To show the great superiority of French work in this direction I need only mention two illustrations which appeared in this journal a short time back, namely, base of a statue erected in memory of General Chanzy at Le Mans, by Croisy, and La Fontaine St. Michael at Paris (see issues for July 26th and August 2nd, 1899).

Suggestions have from time to time been made by different art enthusiasts for acquiring the poverty-stricken gardens lining each side of the Euston Road and converting a portion of that thoroughfare into a boulevard. Would not this have been done long ago in Paris? Portions of the bequest of the late Sir Frederick Leighton for the improvement of London streets might be supplemented and used for schemes of this kind.

The local authorities now seem to be interesting themselves in this subject, and not long since one of the vestries invited competitive designs for lamp standards. Let us hope their example will be generally followed.

That the man in the street is becoming interested in the artistic aspect of London is evident from recent occurrences. I refer to the controversy over the new Vauxhall bridge, the prevention of flash-light advertisements by the County Council, &c.; and in the new Strand to Holborn scheme it is to be hoped that designs will be exhibited to the public in a more accessible place than the committee room of the House of Lords, as was the case with the Government Offices.

One would think that the R.I.B.A. would foster such exhibitions, if only for the sake of further interesting the people in the architecture of their own city. The Passmore Edwards Settlement is undoubtedly doing great good in placing before the public such subjects as "Unlovely London," "A Garden City," and "Paris and the Exhibition." There are at the present time a number of art reformers, including Lord Wemyss, Mr. Walter Crane, Mr. Howard and Mr. Richard Whiteing, each of whom is working in his own particular way; if they were to combine surely something creditable would result.—Yours faithfully,

C. HENZELL-ASCROFT.

Valuation of Houses (Repairs and Empties).

To the Editor of THE BUILDERS' JOURNAL.

PEVENSEY, SUSSEX.

SIR,—The further remarks of "F.S.I." upon this subject are instructive, even if they but represent the different opinions which may arise from a particular course of experience differing from that of others, and I thank him for having made my reply to the querist the subject of so comprehensive a letter. I will endeavour to avoid, as "F.S.I." does not wish to continue the correspondence, giving any occasion for his further reply, and limit my remarks to some few points upon which my arguments are particularly questioned.

In "F.S.I.'s" example the house in Pimlico—of gross rental value £120 per annum—was bought by the present owner ten years ago, apparently in good order. In 1896 it was redraided for £70, and in 1899 £477 was paid for repairs and plain decoration. Very well, then, in this case the owner, if he bought it ten years ago in the belief that it was worth £120 per annum rent, as it was "apparently in good order," was mistaken; or if, on the other hand, he persuaded a tenant to take it on lease at £120 per annum in his (the tenant's) belief that it was "in good order," he misled him. I consider that these outlays should not be taken as ordinary repairs, but as improvements, wherein "F.S.I." differs. The rent in proper estimation should have been less by a reasonable percentage upon the stated outlays until these were done, when, and not until when, it should have been worth the £120. As improvements they should bear a reasonable return in the increased value of the holding, and as they were not calculated upon when the building was purchased, they certainly should not form a deduction under the head of ordinary repairs.

I must say, whilst not wishing to provoke further discussion, that if, in this case, the owner was advised to purchase the house apparently in good order, and in nine years' time had to pay away in unlooked-for "extraordinaries" over four-and-a-half years' value of the gross rental, he certainly was not advised honestly, nor had he the picture presented in its proper colours.

With regard to rates and taxes, I take it that in estimating the rent which a property is worth to him, say, for instance, to an owner in occupation, the variable amounts of rates and taxes, including those payable by occupier, must, together with all other outgoings, be taken into consideration. If, however, the value be estimated upon the rent yielded when a property is let, the tenant paying rates and taxes, then it will be understood to have been reduced by the amounts of these.—Yours truly,

E. BRAND.

THE PAVING OF CARRIAGEWAYS.—II.

BY A SURVEYOR.

(Concluded from p. 170 No. CCLXX.)

THAT ideal material for the paving of carriage-ways—**asphalt**—must now engage attention for a short time. Considering some of the advantages of this material, its superiority to any other form of paving, from a sanitary point of view, is obvious from the small amount of moisture it absorbs. It also commends itself on account of the simplicity with which it can be cleansed, its noiseless character, the ease with which it can be repaired without depriving vehicles of the use of a particular street, its unquestionable durability, and its great resisting power. Our principal sources of supply of this bituminous limestone are in rocky formations situated, amongst other places, in the Val de Travers, Neuchâtel, Switzerland. The Pyrimont and Garde Bois mines of Seyssel, France, and Limmer, Hanover, also furnish large quantities, and the famous asphalt lake in the island of Trinidad must be mentioned more particularly as the chief provider of the

Asphalt-Paved Roadways

of the United States. Asphalt, as a rule, contains from 8 per cent. to 12 per cent. of bitumen. A material that is liable to crack is produced when 8 per cent. or less of bitumen is present, and if there is more than 12 per cent. the heat of the sun's rays will have a softening effect. Of the two classes into which asphalt can be naturally divided, the

FIG. 5

compressed variety is more suitable for carriage-way purposes than the mastic kind. In the making of compressed asphalt, preparatory to heating the rock asphalt, it has to be subjected first to a crushing process in a suitable machine and then to pulverisation. In the operation of heating, the temperature, which varies from 240 to 260 deg. F., must be such as to secure adhesion of the material by compression whilst obviating calcination. In the preparation of the roadway for the reception of the asphalt the same method must be adopted as if wood were to be the external covering of the carriage-way. That is to say, a foundation must be made of 6 in. of Portland cement concrete, and the surface floated with Portland cement mortar. The foundation having set and become thoroughly hard, it should be concealed by a 3 in. layer of asphalt (see Fig. 5). Ramming with hot irons until the thickness has been reduced to 2½ in. or thereabouts will constitute the finishing process previous to allowing the passage of vehicular traffic, after the whole has cooled. An asphalt-paved road should have a cross-fall of 1 in 48, and with regard to gradients no vehicular passway with a steeper gradient than 1 in 65 should be covered with this material. In general, asphalt is only called into requisition for the paving of the roadways of large towns and cities, and then its use is mostly confined to the narrow streets, wood being the medium adopted for the broader arteries of traffic.

Where questions of quietness are all-important, wood has long been resorted to as a paving material, but one that has come into vogue considerably of late, and answers admirably, is

Cork Paving.

The cork bricks placed on the market by the Improved Cork Pavement Company, Limited, consist of blocks 9 in. long by 4½ in. broad by

FIG. 6

2½ in. thick, composed of chips of cork compressed into the form of a brick with tar and other materials. Just as if preparing for a wood pavement, a concrete foundation is made 6 in. in thickness with lin. floated surface. Time having been allotted for this to set, the surface should receive a coating consisting of a hot mixture of tar and tallow in the proportion of 1 gallon of the former to 4 oz. of the latter. This in its turn should be allowed to become firm. Due caution being observed to prevent burning, the jointing material should be heated in an asphalt boiler and may be conveyed, so long as it is quite hot, in pails to the actual scene of the cork laying. Here the cork bricks should be dipped into the buckets in such manner that the lower surface is covered together with lin. up the side (see Fig. 6). This can be easily accomplished if the service of a sharp-pointed tool, like a slater's hammer, is utilised as a handle by sticking it into the brick. Then the cork bricks should be stuck down on to the floated surface of the concrete as close together as possible. Public authorities in all parts of the country have used this

making special bricks for paving carriage-ways. The product turned out is a brick very similar to blue Staffordshires, but without any frog, and the arrises are rounded in order to prevent chipping of the edges. Several samples of these bricks have been laid down, experimentally, in a London thoroughfare, but sufficient time has not elapsed to enable any definite opinion to be formed as to their utility. The method of procedure pursued was to prepare a 6 in. foundation of Portland cement. This was worked up to a fairly smooth surface, and when set a layer of fine sand was spread on it, upon which the bricks were laid in the same manner as are granite setts (see Fig. 7). Courses numbering three were laid next the kerb and parallel to it in order to form the channel, and the bricks in the carriage-way were laid close together at right angles to the kerb. They were then rammed with a wooden rammer and grouted up with bituminous grout composed of pitch and tar in the proportion of 4 cwt. pitch to 5 gallons tar. Finally a dressing of shingle was spread over the road, and the whole closed to traffic for one week.

Other Trials.

At different times various other materials have been suggested for carriage-way paving. For instance, some years ago a combination of wood and steel was tried at Sheffield. The steel was in the shape of an angle piece at the corner of each wood block, and had a foot which rested on the concrete foundation. These feet were embedded in a thin layer of pitch run over the concrete, and the interstices of the wood blocks were filled in with pitch. Then, with a view to obtaining a minimum of noise, gutta-percha has been used in short sections at Glasgow and also at the entrance to Euston Station, London, but this form of paving has not been sufficiently widely used for any opinion to be expressed as to its utility.

Prime Cost and Lasting Power.

In concluding these articles, a few remarks remain to be made concerning the cost and duration of carriage-ways. These two matters, with the question of the price of maintenance, are of the highest importance. Often the material of a road for a particular street is determined by how much money must be expended in laying, or what term of service will be given in return for the outlay, or what will be the yearly cost of keeping the road in proper condition. A macadamized road, for instance, costs from 6s. to 8s. per yard super., but the amount required for keeping it in repair is excessive, being from 2s. to 3s. per yard super. per annum. But still, the consideration must not be lost sight of that there is practically no limit to the duration of such a road if periodically attended to. Then to pave a road in Guernsey granite setts 3 in. by

FIG. 7

9in. by 6in. deep in London would cost about 18s. per yard super., including a foundation 6in. thick of Portland cement concrete. Such a paving would probably last twenty years, but it would require redressing and relaying during this period, and the expense of this would be 5s. per yard super. The cost of a carriage-way paved with creosoted deal blocks 5in. deep, laid upon a Portland cement concrete foundation 6in. in thickness, works out at about 10s. per yard super., and has lasted from six to nine years. Quite uncertain is the duration of a road having jarrah 5in. thick laid upon a foundation similar to that last named. It will have cost about 15s. per yard super. when the work is finished. For a metallic asphalt laid on a 6in. Portland cement concrete foundation in a London thoroughfare the authorities will have to pay from 14s. to 16s. per yard super., and it will last, with ordinary repair, from fifteen to twenty years. The expense of a cork paving 2½in. thick on 6in. Portland cement concrete will be 13s. per yard super.

DOMESTIC WATER SUPPLY.*

By G. M. ROSS, M.A., B.E., M.I.C.E.I.

THE importance of a plentiful supply of pure water and the difficulties which have to be overcome to obtain it are seldom realised by persons living in towns and cities supplied with water by local authorities. The water, which is as necessary to their existence as the air they breathe, or as the food they eat, scarce gives them a thought, unless, indeed, by some chance, such as frost or the bursting of a main, the supply is cut off and they are left for a few hours without water.

The care of the engineer or the architect is, however, very different. Suppose he is called upon to supply an existing house with water, or to design a house to be supplied with water in a country district. Let the house be large or small, be it a hunting lodge or a nobleman's mansion, a supply of water has to be found, and the health and comfort of the inhabitants depends in a far greater degree than is commonly thought on the quantity and quality of the supply provided, on the quantity for the efficient flushing of the drains, for the supply of baths, washing purposes, &c., and on the quality of the water used for dietetic purposes. When either the quantity or quality of the water is defective the community must suffer. If the quantity is deficient, flushing of drains, personal cleanliness, baths, washing of clothes, &c., must be neglected; while the use of impure water for dietetic purposes is now known to be one of the causes, if not the most fruitful cause, of disease.

It should be at once laid down that no water which is unfit to be used for dietetic purposes should be supplied to any house unless under the very strictest precautions. The prevalent idea that any water is good enough for baths and similar purposes, and that the comparatively small quantity required for drinking and cooking can be drawn from some other source, perhaps carried by hand from a distant spring, should not be entertained for a moment. True, it may not be so necessary to have an absolutely pure water for a bath or similar service, but who can guarantee that the general water supply for the house will not be drawn from the nearest and most convenient tap? Indeed it may safely be asserted that unless a more handy means is provided the water used in the bedroom will be drawn from the bath or lavatory taps. When properly safeguarded, however, a comparatively impure water may with considerable advantage be used for flushing drains and such purposes.

The necessity of a plentiful supply of pure water being admitted, the first question that arises is, what can be considered a plentiful supply? It appears to have been assumed that the quantity of water required by a household should be about twenty-five gallons per head

of the population. This is perhaps true in the towns where personal cleanliness is not carried to a very great length by a large number of the poorer and perhaps by some of the well-to-do members of the community; but where daily or even weekly baths are indulged in—as would be the case in a large or small country house—twenty-five gallons is not enough, and thirty or even forty gallons may be provided. It may also be useful when dealing with country houses to remember that each horse will require a daily supply of about sixteen gallons, each cow ten gallons, and that there will be other demands, such as carriage washing, and that any overplus will come in handy for use in the gardens. We will now consider a few of the means adopted to obtain the supply of the necessary quantity. The first which suggests itself is the collection of rain-water.

Rain-Water Supply.

Rain-water is always more or less charged with impurities derived from the atmosphere and from the surfaces on which it falls. These impurities are contained in much greater quantities in the first portion of a shower, owing to the washing of the roof and gutter surfaces, and it is therefore desirable that a self-acting arrangement should be used to allow the first part of a shower to pass off direct into the drains.

Even with this precaution it will be necessary to filter or rather screen the water before it passes into the storage tank. This filter or screen should, if possible, be above ground, but whether over or under ground ample means of access should be provided for examination, flushing, and cleansing. A simple down-and-up gravel filter with not too fine sand will serve the purpose admirably if frequently emptied of sediment. Of course the water is not filtered in the strict meaning of the term; it is merely screened and cannot be considered fit for dietetic purposes; but from its peculiar sooty taste and smell it is not likely to be so used. Rain-water when properly collected and stored is peculiarly suited for washing purposes on account of its "softness." Soft water has, however, the property of acting on and dissolving metals, particularly lead and zinc, if left in contact with them for any length of time.

The storage tank should therefore be made of slate or concrete. Concrete lined with asphalt makes a good tank. It should be covered but well ventilated, and fixed in such a position (preferably over ground or partly above ground) as to be easily accessible for inspection. It should be regularly examined and cleaned out at short intervals, and it is in this connection that the advantage of having the tank above ground, or, at least, over the level of some drain, is apparent. The simple opening of a scour valve for a few moments gets rid of most of the impurities. Even where the bottom of the tank cannot be constructed above the surface of the ground, or above the drains, a scour pipe should be taken from the bottom and carried up the necessary height. In this way if the tank is constructed with a fall towards the outlet a great deal of the objectionable sediment will be got rid of when the scour valve is opened.

To calculate the quantity of rain-water which it is possible to collect, we must ascertain the average yearly rainfall for the district, and allow at least 20 per cent. for loss from evaporation and other sources, and then multiply this by the horizontal area of the roof surface. In this connection it is well to remember that one inch of rain represents 4·68 gallons of water per super. yard, or very nearly half a gallon per super. foot. Probably the roof surfaces will be calculated in feet. Working out the calculation for a rainfall of 30in. per annum (which is about the average in Dublin), and allowing 60 super. feet of roof surface per head, we see that not more than two gallons per head per day can be stored. And this assumes that your tanks are large enough to store and prevent waste of all the rain which falls at irregular intervals. It is needless to say that this is very often impracticable. We must therefore

look to some other source of supply, such as a well, a spring, a stream, or a lake.

Wells.

The selection of a site for a well is a subject which deserves a great deal more attention than it usually receives, especially if water is known to exist close to the surface. The object being to obtain a water supply as pure and as uncontaminated with surface or other impurities as possible, the convenience of the position should be a secondary consideration; but this is very often the important element in determining the site, the object being to keep the cost as low as possible by reducing the length of pipe required. A common practice is to dig two holes in a convenient position; the deeper of the two is sunk below the water line of a water-bearing strata and is the "well," while the other hole is the "cess-pool," and into it is discharged all the house sewage. The contents of the cesspool gradually soak away through the surrounding soil and mingle with the waters below.

As the contents of the well are pumped out they are replenished from the surrounding mixture, and it is not therefore very surprising that such a well does not become dry even in summer; in fact, in some cases which I have investigated there appeared to be very little liquid lost during the process of circulation. Unfortunately excrementitious liquids, after soaking through a few feet of porous soil, often do not impair the appearance or palatableness of the waters with which they mingle; and this polluted liquid is consumed year after year until the cesspool, and therefore the well, receives some infected sewage, and then an outbreak of epidemic disease compels attention to the source of the pollution. What has been said here applies with even greater force to large country houses than to cottages. In the large house the well is frequently placed close to or under the scullery or yard, the reasons being economy in erecting the pump and pipes. When the well is more than, say, 30ft. deep, the cylinder of the pump must be placed in the well with the gearing either directly over it or nearly so. If the well was sunk at some distance from the house there would, therefore, be some additional expense incurred in protecting the pump and providing additional pipes, and the position would not be so convenient for working. Enough has been said, however, to impress on the designer the importance of not making cost the sole or principal consideration in determining the site for a well.

In selecting a site it should be remembered that the underground water slowly but surely moves in a certain direction, towards its natural outlet, which can generally be ascertained by observing the contour of the surface of the surrounding country, by noting the relative positions and levels of springs and streams, or by examining other wells in the district. When the direction of the current is ascertained a well should be sunk in such a position as regards possible sources of pollution that the underground water flows from and not towards the well.

It is not easy to say within what distance from a possible source of pollution it is safe to sink a well, but it should be borne in mind that even if the source of pollution is below the well, and that, therefore, the polluted water ordinarily flows away from the well, yet that when the level of the water in the well is lowered by pumping, the conditions may be altered; and if pumping is continued for any considerable length of time the current will be reversed, and the well may be polluted.

Certainly no well should be sunk nearer to any possible source of pollution than from 100 to 150 times the greatest possible depression of the water in the well likely to be produced by pumping. This distance will, of course, vary with the nature of the soil. The mouth of the well should be closed over and fitted with a manhole cover to give access for examination and repairs to pumps, and care should be taken by making the walls of the well near the surface and the roof water-tight to prevent any possibility of surface water reaching the well.

If unfortunately by any chance drains have to be placed near a well, it would seem to

* A paper read before the Architectural Association of Ireland on March 20th, 1900.

be hardly necessary to say that they should be absolutely air- and water-tight and constructed, preferably of iron, in such a way as to minimise the risk of possible injury; yet it is an everyday experience to find drains of the most faulty construction laid within a few feet of a well, and laid by men who ought to know better. The danger of contamination is of course much greater in the case of a well sunk in a porous soil, or technically a "shallow" well, than in the case of a "deep" well sunk through a superficial porous bed and an underlying impermeable stratum to reach a water-bearing strata below.

It will be observed that the term "shallow" and "deep" are not used to mean actual depth, as a "shallow" well may be actually sunk to a greater depth than a "deep" well. Where it is likely that the well will have to be sunk to a considerable depth, it is very usual to use boring tools and bore a hole, say, 4in., 5in., or 8in. in diameter.

These bored wells are usually lined with metal tubing, and are therefore very free from surface contamination. Frequently deep wells are dug in the ordinary way for a certain depth and a bore hole is continued from the bottom down to the water-bearing stratum. In this case the upper portion should be carefully steined with brickwork in cement, concrete, or cast iron, as far down as the impermeable strata, so as to exclude any possibility of surface pollution.

In some districts it is possible to drive a tube from the surface into a water-bearing strata. The tube is then called an Abyssinian well. The tube is of wrought iron or steel, generally about 1½ in. diameter; it is in different lengths according to the depth at which the water is expected to be found. The bottom length is finished with a steel point shouldered out so as to be a little larger than the tube. This shoulder reduces the friction on the tube and facilitates the driving. The tube for about 2ft. up from the point is perforated with a number of holes, usually about ¼ in. in diameter, which allow the water to enter.

The tubes are driven into the ground by means of a monkey and tripod. From time to time a pump is screwed on to the tube, and the well is tested for water. In all tube wells, the tube itself being small, the condition upon which it can be effective is that there is a free flow of water to it—in fact, the tube is really only the suction pipe. The continued working of the pump has a tendency to clear out and open the passage in the soil, and in some cases to form a bulb or reservoir round the bottom of the well in which the water accumulates while the pump is not at work. Two or more tubes may be driven close together and coupled up to one pump, and thus increase the yield.

In all cases the yield of a well can only be ascertained by pumping down to a certain level, measuring the quantity of water taken out, noting the depression of the water in the well, and the time it takes to regain its original level. An examination of the contour of the surrounding country may often suggest the possibility of a

Gravitation Supply.

Where this is possible, other conditions being the same, it is the most desirable. It enables the supply to be constant, less storage is required on the premises, and the annual or daily cost and trouble of pumping is saved.

The question in each case must, however, be considered on its merits. The quality of the water, whether it will be necessary to filter it, and if it is necessary, what will be the cost of these filters, the cost of the extra length of pipe, the cost of pumps, and the cost of pumping, if necessary, must all be taken into account, and a balance struck. In some cases where a well is situated in high ground it may be possible to draw the water off by a syphon. This is to all intents and purposes a gravitation scheme, the well forming the tank or reservoir. Great care will, however, have to be taken in making the joints of the pipes forming the syphon air-tight, as even a very small defect which would only cause an insignificant leak in an ordinary gravitation supply will very soon completely stop a syphon

by the admission of air. It may here be opportune to say a few words about filters.

A filter should be of the very simplest construction, and it should be fixed at or near the source of supply, so that impure water may not enter the mains. The water should be first strained and admitted into a settling tank so as to allow as much as possible of the grosser impurities to subside. It should then be passed through a layer of sand and gravel. The sand should not be too fine, but should be clean, sharp, and angular, and the water should not be forced through it too fast.

The filters may consist of about 3ft. of fine sand lying upon layers of gravel at least 2ft. thick, graduated from fine to coarse. The average rate of filtration per superficial foot of filter bed should not exceed about fifty to sixty gallons per twenty-four hours. The effect of a filter such as this on both suspended and dissolved impurities is very satisfactory, as is clearly proved by the effect of similar filters on the water taken from the Thames and supplied by the London water companies to the citizens of London; there being no doubt that a very large proportion of the water so treated has previously passed through the drains and sewers of the towns and residences along the Thames Valley.

The filter should be constructed in duplicate so as to give facilities for rest and cleaning, and at intervals the top layer of sand should be scraped off and washed. It is not, however, desirable to disturb the body of the filter too often, as a filter properly treated rather improves than deteriorates by use, unless, of course, it becomes choked by the accumulation of foreign matter, which is indicated by the reduced flow of water. In no case should it be attempted to make up for this decreased yield by increasing the head of water—in other words by forcing the water through.

Pumps and Pumping.

Having arranged the source of supply it will be necessary, unless a gravitation scheme is practicable, to devise some machine to raise the water to the point of distribution; in other words the water must be pumped, a pump must be provided and means must be found to work it.

A pump to be satisfactory should satisfy two conditions: first, it should be fairly efficient, and second, it should be simple in construction, strong, and not likely to get out of order.

Generally speaking, pumps are not very satisfactory mechanical appliances, but there are on the market some good pumps which can be made to fulfil fairly well both conditions, although several pumps are freely advertised which can scarcely be described as "simple in construction."

The greatest difficulty to be overcome is to provide means for working the pump. For small supplies manual labour may be employed. It must, however, be borne in mind that manual labour when applied to pumping is very expensive and unsatisfactory. This is the case altogether apart from the energy or want of energy of the man working the pump. It arises from several causes. The first is that a manual pump is rarely or never constructed to meet the particular case; the length of stroke, the diameter of the cylinder, and the length of the lever are not designed to lift the maximum quantity of water to the given height in a given time; and consequently the manual pump seldom or never gives anything like satisfactory results. The conditions under which a man, or for that matter any animal, works at a pump almost precludes the possibility of his being an efficient or economical motive power.

To illustrate this, let us assume that a pump has been carefully designed to give satisfactory results in raising water from a well to a cistern 50ft. above the ground, and that the water is at a constant level of 10ft. below the surface, the total lift being thus 60ft. The man will, in an hour, raise a certain quantity of water into the cistern. Let us now suppose that it is desired to fill a cistern placed only 20ft. from the ground, or a total lift of 30ft., the same man and the same pump being employed. We would naturally suppose that in an hour he would raise double the quantity,

as the lift is only half, but, as a matter of fact, he will do nothing of the kind; he will raise little, if any, more water. The reason is that he will not work the handle any faster, and the usual twenty to twenty-five strokes per minute is all he can do.

In the case of a horse or other animal walking round in a circle the same remark applies, be the lift large or small; he jogs along at the orthodox two or two-and-a-half miles per hour, and the cost to the owner per 1,000 gallons raised is the same whether the water is pumped into the cistern of the mansion 60ft. above the level of the ground or into the trough which supplies the yard. Of course the man or horse does less work, but he does not pump more water in a given time, and the cost per gallon remains the same.

In the case of, say, a gas or oil motor, on the other hand, there is a difference. When the load is lessened the machine goes faster, or the supply of fuel is reduced in proportion to the decreased load, and the cost is proportionately less.

This adaptability to varying conditions, as well as the more careful consideration on the part of the designer of the work which the machine has to do, makes mechanical as compared with animal labour more economical. It is not easy to obtain data from which to calculate the cost of pumping a given quantity of water as the conditions vary so greatly, but there is no doubt that hand pumping is the most expensive means, and even assuming that a horse or other animal is not kept specially for pumping, but is employed for other purposes, this method comes second.

Unless steam is required for other purposes, such as in a public institution where cooking, &c., is done by steam, it is not to be recommended. The waste of time and fuel getting up and letting down steam is considerable.

Gas, if available, is a suitable and economical source of power, the cost of attendance being reduced to a minimum. The oil engine is now nearly as efficient and simple as the gas engine, and it forms a valuable addition to our list of motors. It is now universally applicable, and no doubt will be very largely used.

Then we have the hot-air engine, an excellent motor, but one which requires more attention than the gas or oil engine, and it will scarcely be able to compete with them for efficiency and economy.

Where electricity can be obtained it is, of course, eminently suited for driving a pump. The advantages of the cleanliness, adaptability to position, and practically self-acting properties of the electric motor are unquestioned.

Relative Cost of Hand, Animal and Mechanical Power.

In a valuable paper read before the Society of Engineers in London last year, Mr. Gordon Harris, Assoc. M. Inst. C.E., gives the following table of comparative costs of pumping 1,000 gallons of water to a height of 100ft:—

1st. Hand labour at 18s. per week	265d.
2nd. Horse power	42d.
3rd. Gas engine with gas 4s. per 1,000 cubic feet	144d.
4th. Small steam engine and boiler, coal 20s. per ton	075d.
5th. Oil engine, oil 7d. per gallon	070d.
6th. Electric motor in connection with large plant	045d.

Mr. Harris adds: "The cost of attendance is excluded from Nos. 3, 4, 5 and 6, as in some instances it may be neglected, although in No. 4 an allowance should be made varying in amount with the total daily supply and other conditions, and an addition must be made for coal used in getting up steam."

It will be observed that there is a good deal of uncertainty and indefiniteness about these figures, but I think that they will generally be found to give very fairly the order in which the several motors will stand as regards cost. The cost of hand labour is certainly not too low at the rate charged, 18s. per week = 4d. per hour; the time occupied in pumping would be about 6½ hours, or say 153 gallons per hour = 255 gallons per minute raised 100ft. = 255 gallons raised one foot per minute. This I believe to be too much for a man working for 6½ hours, and I consider that he will not raise

more than 200 gallons per minute, if, indeed, the average man will do so much.

In this connection it may be noted that a horse walking in a circle is supposed to raise from 1,600 to 1,000 gallons one foot high per minute, a man 250 to 150 gallons one foot high per minute, and a steam or other motor 3,000 gallons one foot high per minute per nominal horse power. In the case of the horse or man the amount varies in accordance with the duration of the work, as of course an animal can work harder for a short time, while an engine is not influenced by the duration of the work.

Water Power.

Where a stream with a fall of even a few inches is available, this fall can be utilised to raise the water required to any given height or distance. Where a sufficiency of suitable water can be obtained, with a fall of, say, from 2ft. to 10ft., the hydraulic ram is at once the cheapest and the best machine that we know of. It is simple and effective, and is not liable to get out of order. The results obtained are very satisfactory, and I have known rams to work practically day and night for years without any outlay for repairs and practically none for attendance.

The ram is, however, not so satisfactory where the head or the lift fluctuates. In cases where a large supply of water is required it is better to couple up two rams than to use one large one, as they can work together or separately into the same main, and in the event of repairs, or if the quantity of available water lessens, the supply is not altogether stopped. If the water which works the ram is impure the machine can be constructed to raise pure water from a well or other source, but the arrangement is more or less complicated and is not so satisfactory or efficient as when part of the water used to work the ram is raised. In this case it is well to consider whether it will not be better and cheaper to filter all the water before it passes through the ram, or filter the water raised and use an ordinary ram. The former for preference. Where the conditions are not satisfactory for a ram, such as when a larger supply is required than a ram will afford, or where the head varies, or where it is not practicable to filter the water and pure water has to be drawn from a distance, a water wheel and pump may be used.

Water wheels are of various forms, such as an undershot wheel, a breast wheel an overshot wheel, or a turbine wheel. "Undershot wheels" are wheels where the water is delivered at the bottom of the wheel and where the water arrives with a velocity due to a height nearly equal to that of the fall. "Breast wheels" are wheels where the water is delivered between the horizontal plane passing through the centre and the bottom of the wheel. "Overshot wheels" are wheels where the water is delivered at the top, or at a point situated above the horizontal plane passing through the centre.

These wheels all work on a horizontal axle, while turbine wheels may work on a horizontal or vertical axle and are divided into wheels which receive the water at the centre and discharge it at the circumference, and wheels which receive the water at the circumference and discharge it at the centre.

Roughly speaking, it may be said that undershot wheels are most suitable for very low falls, breast wheels for intermediate falls, overshot wheels for higher falls up to the diameter of the wheel, and turbines for practically any fall, no matter how high or how low.

Windmills.

Where water power is not available a windmill may be used. Until recent years windmills have not been very much used in this country to pump water, as there seems to have been a prejudice against them, which the author admits he shared; but of late years some very excellent and cheap windmills have been introduced, and where an exposed position can be found and sufficient storage, say, a week's supply, can be provided, there is no doubt that a windmill forms a very efficient and economical motor, and if an auxiliary power, such as a horse gear, is attached so as to be

used in case of emergency, there is a great deal to be said in favour of a windmill.

A few years ago the author erected a windmill for the supply of water to some villas, and since then extra houses have been built, until now fourteen houses are supplied from the one windmill and pump. A cast-iron storage tank containing about 1,000 gallons is provided for each house, and each house is also provided with a separate hand pump, to be used in case of a stoppage of the main supply. The arrangement has now been in use for some years and has proved perfectly satisfactory.

The tendency, however, is to make the windmills too light, and care must be taken to keep the parts well painted and looked after, as there is no margin left for corrosion or waste of material.

If a sufficient supply of water can be obtained either by pumping or by gravitation, at a high pressure, a water motor may be used to raise water to any required height. The water raised may be a portion of the water used to work the motor, or it may be drawn from a well or other source. In a case in which the author was concerned within the past few months, a water motor was used to raise hard water from a well into a tank fixed a few feet above the ground. The water then gravitated through a water-softening apparatus into an underground tank, and the softened water was pumped by another motor into the house cistern. In this case the water which worked the motors was supplied from a storage tank some 150ft. above the motors. It was first pumped into the tank by a turbine and pumps and was not suitable for dietetic purposes. If there is any great variation in the head or lift of the water, a motor is not an economical machine, as from the want of elasticity of the water the ratio between the quantity of water raised and the quantity required to raise it in any given machine is constant, no matter what variations of pressure take place. For this reason motors are best suited for high pressures, and where such are available these machines form a clean, compact, and reliable power.

In the case that I have referred to, as the impure water was available, and therefore the original cost of pumping had not to be seriously considered, the arrangement proved quite satisfactory.

I think I have now exhausted all practical sources of power for obtaining a supply of water, but it may be of interest to recall a scheme which was laid before me in all seriousness some years ago. A man had taken out protection for a "See-saw" to be worked in conjunction with a pump, the idea being that the children and ladies of the family while amusing themselves would, without labour, supply the house with water. I have always regretted that I did not keep a note of the name and address of this genius.

Lately I have seen in the papers another bright idea. The proposal was to attach a pump to the entrance gates so that all persons passing in or out of the premises would unconsciously raise a certain quantity of water and supply the house. I am not aware that either scheme has brought money or fame to the ingenious inventors.

West Ham Housing Scheme Rejected.

By the result of a poll of the burgesses on the West Ham Parliamentary Bill, the £1,000,000 housing scheme has been rejected, as was also the scheme for acquiring certain land and building municipal lodging-houses upon it. The West Ham Board of Guardians has received the sanction of the Local Government Board to the expenditure of £225,000 for the erection of an infirmary.

City School Re-opened.—The Freeman's Orphan School at Brixton has been re-opened after a lapse of several weeks, owing to a serious outbreak of diphtheria among the children. The source of the infection was believed to be due to faulty sanitary fittings, which have now been thoroughly overhauled, together with other parts of the drainage system, the work being carried out under the direction of the medical officer of health for Lambeth.

Keystones.

The alterations at the Cookridge Street Baths, Leeds, have cost between £7,000 and £8,000.

A new Organ at the Diocesan Training College, York, has been built by Messrs. Hopkins, of Skeldergate, York.

Mr. Sydney Cooper, who is approaching his 97th birthday, will have four large canvases at the Academy this year.

A new Roman Catholic Chapel at Alyth, Perthshire, has been built from plans by Messrs. Spiers and Co., of Edinburgh.

A new Home for the City of Dublin Hospital Nurses is being erected from the designs of Mr. Albert E. Murray, F.R.I.B.A.

A Lych Gate at Radyr Church, Cardiff, has been erected from designs by Mr. G. E. Halliday, F.R.I.B.A., of Cardiff. The framework is of oak.

Mr. John Duncan, a well-known Dundee artist, has been appointed to take over the direction of the Arts Department of the Chicago Institute.

Hastings' New Workhouse, in course of erection opposite the old building, has been designed by Messrs. Jeffrey and Skiller, architects. The builders are the executors of the late Mr. Peter Jenkins.

The death is announced of the Rev. Francis Haslewood, F.S.A., of Ipswich. He was best known for his ardent interest in matters of antiquarian and historical research, and was secretary to the Suffolk Institute of Archaeology and Natural History.

Result of Competition.—The award of the assessor in the open competition for an orphanage to be erected at Bontnewydd, near Carnarvon, has been given, and the plans of Mr. T. Taliesin Rees, F.R.I.B.A., of Birkenhead, are placed first. Mr. Rees will carry out the work.

New Police Station and Court House for Grimsby.—Plans have been accepted for a new police station and court house at Grimsby, which is estimated to cost about £7,242. The plans will be submitted to the Home Office for approval, and tenders will then be advertised.

The Guildhall Art Exhibition.—On April 9th the Lord Mayor formally opened the exhibition of works of living British artists which has been organised at the Guildhall Art Gallery under the auspices of the Corporation. The exhibition will be open daily until July 10th. On Sundays admission will be between the hours of 3 and 6 p.m.

The Stevenson Memorial Church, Glasgow, is being erected at Belmont Bridge from designs by Mr. John J. Stevenson, of London, and is in the Scottish variety of the late Gothic style of architecture. Messrs. W. and J. Taylor, of Glasgow, are the contractors for the mason work, and Messrs. J. and G. Findlay, of Glasgow, for the joiner work.

Decoration of the Houses of Parliament.—Lord Balcarras recently asked the First Commissioner of Works whether it was proposed to continue the decoration of the Central Lobby, and, if so, what designs had been submitted for that purpose. Mr. Akers-Douglas said: "I regret I have not seen my way to ask for funds for proceeding with the decoration of the Central Lobby this year, and consequently I have not obtained designs for the remaining panels."

Whitechapel Art Gallery.—There will be no picture exhibition in Whitechapel this Easter, as it is hoped that the permanent collection may be opened at the new gallery early in the autumn. The art gallery, which adjoins the Whitechapel Public Library in the High Street, is now out of the builders' hands, and the walls are drying before being made ready to take pictures. It will accommodate about 500 works in two main galleries, one above the other. Mr. Harrison Townsend is the architect. The bottom gallery, which is to be occasionally used for lectures, will seat about 550 people.

ITALIAN ORNAMENTAL ALABASTERS.*

ANYONE who visits the Duomo of Siena must feel a deep admiration not only for the elegance and the richness of its pure Gothic style, for the incomparable pavement, for the frescoes, the statues and the missals of the famous library, but also for another speciality of the noblest decorative art.

Twelve big columns (more than four meters in axis) of the beautiful "noble" or "oriental" alabaster (calcic alabaster, alabastrite) stand two by two at the sides of the six altars in the lateral aisles, together with the pilasters, pedestals, capitals, friezes, polished slabs and other accessories, all of the same superb ornamental stone. And there, in that charming and celebrated town, where every common man of the people speaks the purest Italian language with harmonious pronunciation and where everything recalls the chivalrous and bold customs of the Middle Ages, in the midst of the highest manifestations of art and poetry, other churches and monuments make a show of the magnificent stone. Sixteen similar columns are to be admired at the seven altars of the Madonna di Provenzano; others of smaller size in the church of San Vigilio; and out of Siena, in Rome, in Naples, in Arezzo, in Orvieto, and everywhere, Roman munificence extended itself; temples, palaces, thermae, are ornamented with the richest and most beautiful varieties of alabasters, in which the harmony of colour, the singularity of natural designs and the high polish are quite remarkable. The excavations of Roman ruins have already brought to light innumerable blocks of such marbles, which are collected either in archaeological museums or institutes of geology and mineralogy applied to mining industries.

The alabaster called "oriental," though found in Italian, or, rather, in Siennese quarries, is unique of its kind in the large family of marbles. The monochrome marbles, ancient and modern, the black and the white; the breccias, the brocatellos, the lumachellas or shell marbles, the Africans, the cipollini, &c., are very different from each other in hardness, brightness of colour, fitness for polish, variety of specklings and spottings; but they are all microcrystalline, or compact forms more or less metamorphosed or transformed in solid aggregates of geometrically regular elements. They have become such by means of internal molecular movements which took place in their initial condition of mud deposited in layers in the depth of the sea during the remotest ages of the primitive history of our globe.

On the contrary, true alabaster, here referred to, is a rock of chemical formation in fresh water; it was originated in more recent geological periods, and could even be produced in the present one; it is more or less translucent or transparent if observed in slabs of medium thickness, and is largely crystalline, i.e., composed of big crystalline elements. Some of its rarer kinds, namely, those of a beautiful amber or yellow colour (var. called "pece greca"), are very often as diaphanous as these resins and show beautiful reflections of light, due to flat facets of crystallization placed in different directions; and if we move a lamp round a slab of this variety, thinly cut and highly polished, so that it be more and more translucent, we can see sudden flashes of luminous reflections producing a splendid effect of *chatoyment*. Generally the most abundant varieties, which are found in magnificent blocks and colossal monoliths, show alternating stripes of golden, of honey yellow, pink and red, pearl grey, milky white, and blue colour; all these tints mellowing into each other with an infinite variety of shades and contrasts, and with a marvellous combination of curves and waves and loops, fringes and meanders. In some of the clearest and most transparent varieties

we very often find the radiated or fan-shaped crystallization, and even the masses originated in contact with those rough calcic marbles called "travertins," of which they included fragments or received filtrations, are beautiful to look at, and fit to be used for their brightness of colour and peculiarity of structure.

This alabaster marble may be considered as the classic type of a powerful crystallization of carbonate of lime; but it is at the same time a material and tangible indication of the progressive and not yet accomplished exhaustion of the eruptive activity in the neighbouring ancient volcanoes.

The volcanic cone of Monte Amiata or of Santa Fiora, surrounded by mountains rich in mines, is about 15 kilometres distant from the alabaster quarries, and its last eruptions of trachytic crystalline lavas took place towards the end of the tertiary period, that is to say, during relatively recent times.

The quarries are in the province of Siena, and on the steep north-western slope of the hill on which the picturesque village of Castelnuovo dell'Abate is situated. They are consequently very near the railway station of Monte Amiata on the Siena-Asciano-Grosseto line. The traveller who from this station ascends the winding path leading to the village, and stopping at the group of houses modestly called *Basso Mondo*, looks south-west at the declivity leading to the river Orcia, and will directly be aware of a sudden depression in the ground partly hidden by a thick wood; he will easily guess that an enormous landlip must have happened there, such as to form an excavation of an area of about nine hectares, in full contrast with the low hills and the undulated country all around. And if from the *Basso Mondo* he were inclined to descend the path towards that area, he would soon face a scene not unworthy of a poet's pen or of an artist's pencil. Passing amid those rocks, climbing and jumping from one to another of those enormous and magnificent crystallized calcic masses, which are shining with unknown beauties in their inner multifarious substance, he would stop before unusual landscapes, horrid and charming at the same time because of the contrast between the extraordinary confusion of blocks and crevices and caverns, the outcroppings of stratifications *in situ*, and the groups of oaks, evergreen oaks, elms, and other forest trees; and he would at once understand that some powerful commotion of the ground must have upset all that area after a very ancient and very long period of submersion in stagnant or lacustrine waters, during which phase the sources of the same waters having become calcareous the area was covered all over with calcic incrustations of porous structure, penetrated with argillaceous and ferruginous earth (typical travertins); and afterwards, at the beginning of the upheaval of the ground, the strata of marbles already formed must have been cracked, broken, and thrown out of place according to the increasing declivities and a number of crevices must have been formed through which the thermal and mineral sources, so rich in carbonate of lime, could find their way from the underground to the surface; and there, shut in by the same travertins they had formed, allowing the deposition and the crystallization of their mineral contents, which instead of forming the rough and porous layers and banks of travertine, produced the large incrustations and connections between the disjointed masses and the subsequent levelling stratifications on the pre-existent ground. But while this same ground, here as in the valleys of the Tiber, the Aniene, in the Ascolan region, and elsewhere, was becoming more and more covered and incrustated with such layers, it was also being gradually and continually upheaved until it was much too steep to preserve its equilibrium, and thus it happened that its stratified banks were bent and broken at the top and formed a crest with very steep opposite declivities; then broke again everywhere, and especially towards the bed of the Orcia, sinking into hollows and dales or standing up perpendicularly, always preserving a recognisable parallelism in the projecting parts.

But the blocks in this way detached from the original mass rolled upon and mutually supported each other in a strange equilibrium; and while presenting a chaotic but most picturesque scene to the eye, brought also in view and at hand the best qualities of marble, making others accessible through their large open crevices; so that nowadays the choice would be easy to anyone who intended to use such varieties for the adornment of cathedrals, theatres, palaces, cemeteries, squares and public gardens with columns, slabs and monuments, and even smaller artistic objects for villas, museums and galleries.

One can thus but heartily wish that in honour of Italian art and industry the ornamental Italian alabaster may become again the fashion, as it was in the periods of highest æsthetic and productive architectural magnificence, and that it will be recognised as the most ornamental and most useful among the marbles due to pure carbonate of lime of volcanic hydrothermal formation.

Our Monthly Review.

WITH this issue we are starting a new feature—a monthly review of the art, professional, and trade journals likely to interest readers of *THE BUILDERS' JOURNAL*. We hope to make this review of some interest to readers of this journal who may not have the chance of seeing the periodicals we refer to, apart from any value it may have as a catalogue of modern literature and a record of progress in the arts, crafts and trades we have to deal with. Publishers are cordially invited to send us any of their publications affecting the interests catered for by *THE BUILDERS' JOURNAL*, and may rest assured that they will have fair consideration.

The Scientific American: Building Edition (New York) for March contains a number of interesting articles, but the majority of the buildings illustrated are not worthy of a place in its pages. American architects produce some very fine works when on a large scale, but the average of the domestic architecture is very low indeed. Three erections, of which Mr. E. E. Holman is the architect, are worthy of notice: "Buena Vista," a residence treated rather picturesquely in the Spanish and Italian style of architecture, at Hillcrest Manor, Greenwich, Conn.; "Cliff Eyrie," a log house; and "Cosycote," a log cabin, at Greenwich, Conn. It is somewhat strange that his other buildings illustrated should be so mediocre. It is interesting to have particulars of the ten buildings considered the most beautiful in the United States, selected by readers of the "Brochure Series." The list is as follows, in the order of votes received:—The Capitol at Washington, Messrs. Hallett, Thornton, Hadfield, Hoban, Latrobe, Bulfinch, Walter and Clark, architects; Boston Public Library, Messrs. McKim, Mead and White, architects; Trinity Church, Boston, Messrs. Gambrill and Richardson, architects; Congressional Library at Washington, Messrs. Smithmeyer, Peltz and Edward P. Casey, architects; Library of Columbia University, New York City, Messrs. McKim, Mead and White, architects; Trinity Church, New York City, Richard Upjohn, architect; Madison Square Garden, New York City; St. Patrick's Cathedral, New York City, James Renwick, architect; Biltmore House, at Biltmore, N.C., Richard M. Hunt, architect; and the City Hall, New York City, Messrs. Mangin and McComb, architects. The April number is again overloaded with all that is bad in domestic architecture, but this bad taste by no means extends in a like proportion to the letterpress, which is, on the whole, of a most interesting character. In the March number appeared a review of the fifteenth annual exhibition of the Architectural League of New York, opened on Feb. 10th. This is supplemented in the April number by two photographic views of the galleries, showing some of the exhibits. These are clearly of high character, and are evidence of the great advance American taste has made recently.

* Translation of Professor Comm. Luigi Bombicci's report on the famous quarries of onyx, alabastrite and ornamental marbles situated in Castelnuovo dell'Abate Amiata, Province of Siena, Tuscany; recently reopened by the firm of Miller and Co., Leghorn, after a lapse of four centuries.

We referred some time ago to the good this exhibition has accomplished, and suggested the institution of a similar one in this country. It is surely time something were done in this direction; perhaps the best thing would be to have it in connection with the Congress of Architects held by the Royal Institute of British Architects. Besides these two views of the exhibition there are four photographs of some very beautiful old missions of California on the Old King's Highway.

The Clayworker (Indianapolis) for March contains articles on brick paving for roads, Kaolin, standard paving brick tests, the New York brick market, and many other practical articles. It is this keeping to the practical side in trade journals that is wanted, but we fail to see the good sense in putting in an illustrated stock joke from "Judge" about a nigger stealing fowls.

The American Architect (Boston, Mass.) for March 3rd contains nothing much of interest. The illustrations are well produced as usual, but that is not saying anything for the subjects. The Cauliflower Public House at Ilford is one of our meretricious bits of work that should have been ignored, if not condemned. There is also an illustration of "Minley Manor," Fleet, Hants, by the late George Devey—an attempt in a style the architect did not understand and in which he cannot have exercised his full judgment; the roofs are absolutely hideous. The new Science Building at St. John's College, Annapolis, Md., is a staid classical building, greatly preferable to any attempt at novelty. The number for March 10 contains a useful paper by Herr Max Junghaendel on "Axioms and Principles of Modern Hospital Construction." The illustrations, too, are most interesting. The blocks of the Linen and Woollen Drapers' Institution Cottage Homes at Mill Hill, Middlesex, by George Hornblower, F.R.I.B.A., are snug, picturesque little buildings, but in the administration block there is a striving after effect which renders it more like a district council's offices of the meretricious type. The St. John's Chapel at Matlock, Derbyshire, by E. Guy Dawber is a lovely little piece of work that seems to form part of the simple country side. It is often urged by the practitioners of modern architecture that the beauty of past architecture is due to its age, and that no modern building should be compared with the old without careful consideration of this point. That is all very well, but the instance of this chapel is sufficient to prove that a new building can be quite as beautiful as the old, and harmonise with the surroundings without the aid of the mellowing hand of Time. In the same number is also illustrated the Troy Orphan Asylum, Troy, N.Y., by H. Langford Warren. This is a worthy endeavour in the Gothic style and we are pleased to see that the Yankees are not altogether taken up with the classic of the French school, but Mr. Warren in this building has fallen into the errors which the early exponents of the Gothic Revival in this country fell into. These errors are a too free use of patterns in brick in the endeavour to gain colour variations, the use of conventional forms without due regard to their origin, meaning and utility, and inharmonious with the surroundings. For instance, this building seems plumped down on the site like a cartload of rubbish, the bell-tower or ventilator—which ever it is—would have been better left out and the towers already there used instead for the bells and the ventilators hidden; the traceried windows and the openings in the towers look out of place in a building of this character and without any carving near to relieve their moulded baldness, and would have been better left plain; the square heads to the other windows look out of place in this style, as do the flat roofs of the bay windows; the stepped gables look too finical, and the main entrance porch is a square, dumpy horror; the patterns in coloured bricks are too many and the hollow brick pattern in the gable behind the entrance is quite meretricious; generally a better effect would have been obtained by overhanging eaves and the use of tiles instead of bricks. The number for March 17 gives illustrations of two neat pieces of work by

Bruce Price. We think a great deal better design could have been made of the ten-storey building for the F. L. Ames Estate, Boylston Street, Boston, Mass., although necessarily false. The design for the proposed public library at Dumfries and Maxwelltown, N.B., is another specimen of our horrible municipal architecture. When shall we get a municipal building satisfactory to good taste? Who says that the use of classical styles is prohibitive to invention? The illustration of the highly pleasing house of W. R. Harrison at Tuxedo Park, N.Y., by W. A. Bates in the number for March 24th is a wonderful novelty in the application of classic forms. In this same number are also the original and final designs for the United States Custom House at New York by Cass Gilbert—a truly fine classic work in the best French School Style.

Architecture (Forbes and Co. Limited, 160, Fifth Avenue, New York) is a welcome newcomer into the field of technical journalism. It is a monthly journal costing four dollars per annum post free to any foreign address, and is produced in an excellent style on good paper, the illustrations being reproduced in a style that is above criticism. We are informed that the journal is under the management of a consulting board of five prominent architects, but the illustrations in this third number for March do not say much for their taste. Here we are given the purely meretricious modern designs of French architects. The French school has become well-known for its study of mass and proportion, and we could find much to praise in this and could ignore the bad detail, but of late things have become bad all round, and we are sorry to see our cousins across the Atlantic have not exercised their judgment in selecting the best, but simply followed the bell-wether of French taste wherever it might lead. The designs in this issue of "Architecture" show this, for there is absolutely nothing to recommend in these examples, being neither good in mass, proportion, detail or plan. The residence in the Rue Thery, Paris, is a perfectly ludicrous medley of a supposed classic treatment of Gothic. As tall buildings seem to be insisted upon in America, it is quite right for architects to endeavour to treat them in some architectural manner, and certainly the sedate design for the Batchelor Apartments, Thirty-sixth Street, New York, Mr. Frederick R. Comstock, architect, and Battery Park Building, New York, Messrs. Clinton and Russell, architects, are not altogether displeasing, and reflect considerable credit upon the architects.

The Architectural Review (Boston, Mass.) for March is not quite such a good number as former numbers of this superbly printed and illustrated magazine. It practically contains but one article, but this certainly covers a wide enough range to afford much variety in itself. This is on "American Architecture from a Foreign Point of View: New York City," by Jean Schopfer. The author gives some homely hints and criticisms that are generally sound, and draws the conclusion that for some years to come French influence will augment with the ever-increasing number of American students graduating at the Ecole des Beaux-Arts, but is wisely silent as to the possible future outcome. The plates in this number are of designs for the Graphic Arts, Horticulture and Forestry Buildings at the Pan-American Exposition, Buffalo, N.Y.—a horrible medley of jottings from various styles.

Carpentry and Building (New York) for April contains a number of useful articles on construction, and it would be better if it kept to these, rather than gave an illustration and description of such an ugly house as that at Cranford, N.J., which hardly could have been worse if designed by a jerry-builder here. In this number the first part is given of a useful article by F. E. Kidder on trusses for wooden roofs.

The Brickbuilder (Boston, Mass.) for March is fully up to the level of previous numbers of this sumptuously got-up magazine. It contains, among other interesting articles,

the second part of a highly entertaining series of articles on minor brickwork of the Apennines, with some grand illustrations, and a useful article on heating and ventilating schools. Among the illustrations are several of the new Museum of Science and Art at the University of Pennsylvania, Philadelphia, Pa. (Cope and Stewardson, Frank Miles, Day and Bro., Wilson Eyre, junr., associated architects), a truly beautiful building, with a peculiarly American character. The detail is particularly interesting. The only things against the building are, perhaps, the brick columns and the absence of any features suggestive of an art museum. The building for the Massachusetts Historical Society, Fenway, Boston, Mass., by Wheelwright and Haven, is a nice sedate piece of Classic, but the dormitory for the University of the City of New York, University Heights, New York City (McKim, Mead and White, architects), is strangely unsatisfactory in comparison with the architects' other work.

La Revue de l'Art Ancien et Moderne for April contains illustrated articles on the architecture of the Paris Exhibition; the Chapel of Charity in the Rue Jean Goujon, Paris; Maurice Potter, a painter explorer; the painter, Lampi, second part; Meissen Porcelain and its History; and recent acquisitions of the Louvre Museum. We need not allude to these at length. The Paris Exhibition buildings are, as is now well known, very unsatisfactory, no attempt being made to secure proportion and uniformity in the whole; the permanent erections are better than the others, which are purely panoramic scenery, but even these show the grave faults of modern French work. The Chapel of Charity by M. A. Guilbert is, however, much in advance of other modern French work, and is, on the whole, satisfactory, although the use of stone in unconstructive forms is evident, and that bugbear of classic, viz., the excrescent garland in stone hung from nowhere, is in great profusion. This chapel contains some good decorative paintings by A. Maignan. "Le Bulletin de l'Art Ancien et Moderne," a weekly supplement, sent free to subscribers to the "Revue de l'Art" contains a large amount of entertaining news.

The Berliner Architekturwelt for April shows the want of taste so evident in modern German work. The chief articles are on architecture and art work at the Paris Exhibition, this being the second part of a series; and the new royal stables at Berlin. These stables are built in a most grandiose fashion in the classic style, but are more like a palace, and in no way suggestive of stables. The building is certainly impressive, and good as a reproduction of classic models.

Die Kunst (Munich) for April is somewhat better than recent numbers. The chief article is on Giovanni Segantini, a remarkable artist working somewhat in the style of our pre-Raphaelites. Articles also deal with the sculpture of Max Kruse-Lietzenburg; the "Secession" in Japan, a movement that ought to be discontinued, as apt to ruin the still-lingering tradition that has continued for centuries without a break; the new National Museum in Munich, is a purely frivolous piece of architecture, not worthy of consideration. German arts and crafts are evidently in a desperate state from the illustrations in this magazine, the whole effort being apparently to achieve something novel.

The Master Builders' Associations Journal for this month is full of useful and interesting notes to the trade, but contains nothing of especial interest.

The Pottery Gazette for April has articles on some pottery exhibits for Paris; answers to the City and Guilds of London Institute examination question in pottery and porcelain; pottery at the Furnishing Exhibition, and several other features of interest.

The Quarry for April has articles on the Kilsyth Whinstone quarries, cranes and other lifting and transporting machinery, and the mineral industry in Yorkshire—all of a practical nature. There is also the usual number of useful notes and news of the stone, marble, lime, clay and cement trades.

The Scottish Local Government Gazette is a new penny weekly paper, the first number making its appearance on March 31st, for which there seems a distinct opening. The first number is a bright one and contains much interesting matter for persons connected with county, parish and town councils, school boards and public authorities.

The Engineering Times for April has some interesting articles on the "Halford" gradient railway, by which it is stated to be possible to obtain a speed of 200 miles per hour. Modern methods of saving labour in gas-works, mechanical stokers, the history and development of motor cars, and modern locomotive practice of the world are also treated of. A word of praise is due to the excellent illustrations in this magazine.

The Magazine of Art this month is more than ordinarily interesting. First there is a most entertaining article on John Ruskin, by M. H. Spielmann, followed by an article entitled "Is Ruskin out of Date?" by Robert de la Sizeranne. These two articles are superbly illustrated by reproductions of drawings by Ruskin, one being in colours. Many persons are inclined to consider Ruskin simply as an author, criticising others, but failing in his own attempts. The selection in this issue will show them his versatility and high standard of his artistic achievements. In this same number is a criticism of the New Gallery, by W. H. James Weale; a further contribution to the series illustrating and descriptive of recent acquisitions of our national museums and galleries; an illustrated article on the great bas-relief by Jef Lambeaux, "The Passions of Man;" and an article on Pastel and its value and present position, by A. L. Baldry. There are also the regular monthly chronicle of Art, and several reviews.

The Studio for April is "full of good things." Harriet Ford deals with the work of that highly gifted artist Mrs. Adrian Stokes, the article being well illustrated, one illustration being in colours. There is a most suggestive article on the improvement of sporting cups and trophies, illustrated with examples by C. R. Ashbee, W. Hardiman and W. Reynolds-Stephens. Gabriel Mourey, writes on Paul Renouard, whom he calls a master draughtsman. The illustrations of a bedroom decorated by Frank Brangwyn are typical of the modern rage for "arty-crafty" design. This is, no doubt, a wholesome innovation in moderation, and this room contains much that is good, but it is extreme. Fernando de Arteaga Y. Pereira writes on Alijandro de Riquer, a Spanish painter of considerable merit, and there are the usual monthly jottings from art centres, illustrated by representative but mostly bad pieces of work. It seems a pity that the efforts of Mr. G. A. Reid should have been expended upon the decoration of such a poor piece of architecture as the City Hall, Toronto.

The Art Journal for April contains an appreciative article on the decoration of the choir of St. Paul's Cathedral carried out by Sir William Richmond, written by Miss Minna Gray and illustrated with drawings by Miss Edith James, several being in colours. We were, of course, prepared to see some persons praise the mosaics, but hardly expected the windows to be treated with anything but contempt. Still, whatever may be the merit of the decorations (sic), the article is none the less interesting. Other articles deal with the work of James Maris, the pictorial possibilities of the stage, the potteries at Watcombe and Aller Vale, and a number of illustrated reviews and notes of current matters make up a good number.

International Art Notes is a bright little magazine that makes its first appearance with the March number. It is intended primarily as the journal of the Paris Club, an international association of women artists and others, but the magazine will appeal to everyone interested in modern art. We wish it all success in the character of an art newspaper and not a magazine of ancient and modern curiosities. The first number contains several excellent illustrations, with notes on the various art centres and several short articles. It is

published by Crowdy and Loud, of 7, Pall Mall, S.W., price 6d.

The Home Counties Magazine for April contains several articles of antiquarian interest, illustrated by reproductions of old documents and plates. The articles of chief interest to our readers are those on church plate in the Diocese of London; Westbourne Green, in which an illustration of Isaac Ware, an architect who purchased Westbourne Place, is given with letterpress referring to him; the parish history of Littlebourne, Kent; the church and rectory of St. Michael Bassishaw; Kew, its palaces and associations; Cowper's House at Olney; and the Manor and parish of Littlebury.

The Ruskin Union Journal has made its first appearance with the March number. This issue contains reports of the inaugural meeting and other business done, with the address by the Rev. J. B. Booth, M.A., on "The Life and Work of John Ruskin." The journal is not sold, its issue being limited to members, to whom it is sent free. The cover, designed by Walter Severn, is scarcely worthy the magazine and its objects.

The Antiquary for April contains articles on King Alfred as a man of letters; aboriginal American writing, with illustrations; the old English handicraft of making weapons; the Ivernians; and curiosities of and in our ancient churches, which contains an illustration of the curious seven-sacrament Walsingham font. There are, of course, the usual copious notes on antiquarian subjects.

Feilden's Magazine this month provides us with a mass of interesting and useful matter. The chief articles are on compound and four-cylinder locomotives in England and France, carburetted water gas, modern appliances in gas manufacture, pneumatic tools and appliances, the building of the Great Central Railway, with a number of shorter notes of current interest. There are also practical articles on workshop practice and pattern-making and moulding in the engineering shop. The illustrations are reproduced in the best style.

The Genealogical Magazine this month contains articles on the Armorial Bearings of Leigh, co. Lancaster; the Kirkbys of Kirkby Ireleth, a Cavalier family; the Lords and Marquises of Raineval in Picardy; notes on extinct Irish Baronetries; the Royal descent of James Cecil Coldham Fussell; and others. There is an illustrated article on the Brasses of Margaret, Lady Camoys, and Sir John Leventhorpe. The magazine is most interesting to students of heraldry.

The Reliquary for January is a good quarterly number. Mr. W. Heneage Legge contributes a well illustrated article on Delves House, Ringmer. Mr. John Ward writes on Cinery Urns recently discovered on Stanton Moor, Derbyshire. Mr. Richard Quick, Curator of the Horniman Museum, contributes an illustrated article on old bed-wagons and bed-warmers, a subject seldom heard of. There are also articles on Pigmy Flint Implements, the Biddenden Maids, the Church of St. Ewan at Barévan, Nairnshire, and various other antiquarian matters.

The Journal of the Clerks of Works Association of Great Britain, dated March 26th, prints a paper read before the Association by Mr. J. Watson on "Injector Fire Hydrants." There are also articles on Ruskin, Steel Joists in Cement Concrete, Automatic and Mechanical Ventilation, and other notes of interest.

The British Clayworker for March continues its series of articles on Brick Earths of Great Britain, and on brick drying. There are also articles on the manufacture of glazed terra cotta, the manufacture of majolica dust tiles, with many other shorter ones of a most practical character.

Home Art Work for April contains many chatty paragraphs. The magazine is doing good work in reforming taste in needlework. Architects have of late been paying much more attention to the tapestries and altar cloths in their churches, and we are happy to see that the natural feminine aptitude has

ably seconded their efforts, so that we are in this branch of art work in advance of the mediæval work.

The Artist has articles this month of considerable interest on Jef Lambeaux, Martin Bruce, Church Art, Viareggio as a winter sketching ground, hints to amateur photographers, design for embroidery, with a large number of illustrated notes on current art work. In the article on church art are reproduced several specimens of work at the Clergy and Artists' Association, but the two designs by Reginald Hallward are quite mediocre, and the horn lantern by W. B. Reynolds and the processional cross by A. H. Skipworth are perfectly ugly.

The Irish Builder for April 1st continues the series of articles on Classic details and their application, and on artificial heating. A special plate is given of a parochial hall at Dublin, a simple little Gothic structure by Carroll and Batchelor that is very satisfactory.

The Journal of the Society of Arts for March 23rd contains a paper on English furniture by Mr. Lazenby Libety. In the number for March 30th, Mr. Douglas Cockerell gives a paper on leather for bookbinding, and in that of April 6th there is given a paper on the cultivation, manufacture and uses of indigo, by Mr. Christopher Rawson, F.I.C., and Sir George Birdwood, K.C.I.E., C.S.I., also writes on the etymology and discrimination of vermilion and other ritualistic reds of the Greeks, Romans and Hindus.

The Architectural Review for April is one of the best numbers we have seen of this magazine. Again we have as a special plate a photogravure from a drawing by F. L. Emanuel. Mr. Percy Fitzgerald, M.A., F.S.A., contributes the first part of an article on the life and work of Robert Adam, illustrated by good photographs. The series of opinions by eminent architects on the new L.C.C. street from Holborn to the Strand is continued by T. G. Jackson, R.A., John Belcher, A.R.A., W. R. Lethaby, R. Weir Schultz and Ernest Newton. Mr. J. P. Cooper writes on the town and castle of Annecy, a truly delightful old town from an architectural point of view. More mottoes for decorative treatment are given by Mr. Charles Godfrey Leland, and the Rev. J. Malet Lambert, LL.D., writes on "Early English Craft Guilds." Messrs. Barclay's new bank in Fleet Street is described and illustrated, and a number of reviews and notes on interesting topics concludes the number.

Shakespeare's Church.—In continuation of the restoration and improvement of the Church of the Holy Trinity, Stratford-on-Avon, new stalls for the clergy and choir have lately been erected at the east end of the nave, at a cost of £300.

The Sheffield Society of Architects and Surveyors held its annual meeting last week, when Mr. J. Smith, the president, occupied the chair. The secretary read the thirteenth annual report of the Council, which stated that the present membership of 110 was four less than at the corresponding period of last year. After a reference to the meetings held during the year, the Council dwelt on the correspondence between the Society and the Master Builders' Association on the question of an open arbitration clause. At present no definite decision had been arrived at. The president said the suggestions made by the Council to the Parliamentary Committee of the Corporation with regard to the Corporation Bill had for their object not the diminution, but rather the increase of public advantage, with the least possible hardship and inconvenience to building owners, and they were also made in order to facilitate the co-operation of the architects and the Corporation officials. The following officers were elected for the ensuing twelve months:—Mr. J. Smith (president), Mr. P. Marshall (vice-president), Mr. F. Fowler (treasurer), Mr. Fenton (hon. secretary). Council: Messrs. R. W. Fowler, C. Hadfield, C. J. Innocent, E. M. Gibbs, J. R. Wigfull, J. B. Mitchell-Withers and T. Winder.

Enquiries Answered.

Three-Quarter Brick Facing.

BRADFORD.—F. B. writes: "Can you tell me what is meant by three-quarter brick facing? The bricks are local bricks and the walls are built in old English bond, 3ft. thick."

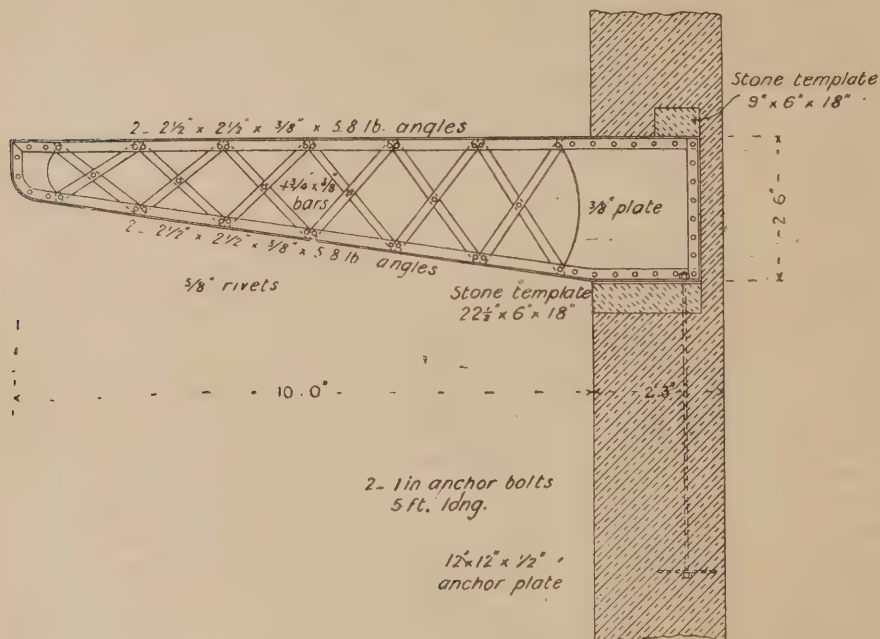

Three-quarter brick facing is not a usual term; it may mean an average of three-quarter brick, i.e., the facing bricks bonded at such intervals as will make the total quantity of facing equivalent to three-quarter brick thick. This would occur in old English bond when all the facing bricks were whole ones, no bats being allowed.

HENRY ADAMS.

Steel Cantilevers.

DUBLIN.—J. J. McA. writes: "I shall be glad to have a solution of the following problem:—Draw to a scale of 1in. to the foot a riveted steel cantilever which is not to exceed 2ft. 6in. deep and is to project 10ft. from a three-brick wall; the cantilever is to carry a distributed safe load of six tons, and is one of a series to take a wooden gallery round a public hall. Mark on the various parts the weights and sizes of the steel."

The accompanying design shows this cantilever. The weight given for angles applies to

3in. thickness, but usually they would be specified by weight and not thickness, as $2\frac{1}{2} \times 2\frac{1}{2} \times 5\text{lb.}$ steel angles, or 6lb. as the case may be. A $\frac{3}{4}\text{in.}$ or $\frac{1}{2}\text{in.}$ bearing plate 6in. wide might be riveted on the back.

HENRY ADAMS.

Sun-Prints.

LONDON, N.W.—M. A. writes: "I should be glad to have a description of the general principles of making so-called 'sun-copies' from tracings. Also, what intermediate step is involved when the original is on drawing-paper or thin cardboard?"

The method of making sun-prints from tracings was fully described on page 133 of the BUILDERS' JOURNAL for April 5th, 1899. In the issue for March 28th last we reviewed a recently-published book on this subject, entitled "Ferric and Heliographic Processes" (Dawbarn and Ward, Ltd., Farrington Avenue, E.C. Price 2s. net.), which should be useful to our correspondent.

Fixing Tiles.

A. O. AND CO. write: "In fixing tiles on washstands with plaster the plaster swells and the wood is caused to warp. How can this be prevented? Which is the best way to fix tiles?"

The addition of five per cent. of lime putty

to plaster of Paris will prevent the plaster from swelling. The mixture should be gauged stiff; if gauged soft the excessive moisture will cause the wood to swell or warp. Add a few drops of size water to the water used for gauging, to retard the setting of the plaster and allow sufficient time for fixing the tiles. Keen's cement or Parian cement is sometimes used for fixing tiles, but they are both too expensive for general work. White lead, used neat, and mixed with plaster, is also used for this purpose; but great care is required in using, as being of a sticky nature the tiles and woodwork are liable to be soiled by it. "Petrura Putty" is the cleanest, safest, and most satisfactory material for fixing tiles on any surface, as it will adhere to brick, stone, wood, plaster, or iron with immediate and permanent tenacity. With the aid of Petrura putty tiles can be as easily and quickly fixed on overhead and perpendicular surfaces—such as ceilings and walls—as on floors or similar flat surfaces. No special preparation or wetting of tiles or fixing surfaces is necessary, so that the fixing is a simple, rapid, and cleanly process.

W. MILLAR.

Party Walls and Adjoining Owners.

NORTHAMPTON.—INDIAN INK writes: "(1) My client in building requires his end wall (which is a party wall) 14in. thick in basement and ground

adjoining owners, if they can agree. If they cannot agree, our correspondent's client may build a wall entirely on his own land, and prevent his neighbour from using it, thus throwing on the latter the whole expense of a wall of whatever thickness the by-laws prescribe for non-party walls. Neither owner has a right (independent of statute, custom, or contract) to build a wall which shall partly stand on the property of the other (*Barlow v. Norman*, 2 Wm. Blachot 959). There is not any foundation, so far as we know, for the notion that where the wall is to be 14in. thick at the basement one of the adjoining owners is to bear the expense of one half of a 9in. wall only. (2) Yes. *Sangster v. Noy*, 16 L. T. 157. The Sunday Observance Act, 1877, 29 Chas. 2, c. 7, s. 6, makes only writs, &c., void.

H. P. B.

Builders' Notes.

London County Council.—At last week's meeting of the Council a discussion arose on the report of the Improvements Committee recommending that eight architects should be invited to send in designs for frontages in connection with the new street from Holborn to the Strand, at a cost of £2,000. (This report is given on page 42 of our issue for Feb. 21st last.) The report was eventually agreed to. A spirited discussion then followed on the instructions to be given to the competing architects, some of the members seeing in a clause in the report a hidden intention of erecting a new county hall for the Council on the site to be cleared facing the Strand. Ultimately the report of the committee, directing the architects, in preparing their designs, to have regard to the indefinite "possibility of the erection of a public building" on the central position of the site, was adopted. Upon the recommendation of the Theatres Committee it was agreed to approve plans for a new theatre in Shaftesbury Avenue. The Council also agreed that the ten acres of Lambeth Palace grounds, to be maintained by the Council, should be named "The Archbishop's Park."

A Painting Case under the Workmen's Compensation Act.—The recent case of *Pearce v. London and South Western Railway Company* was an appeal from the award of the Southwark County Court judge in proceedings to assess compensation under the Workmen's Compensation Act, 1897. The appellant was a painter in the employment of Messrs. Perry and Co., who were builders and contractors and who had entered into a contract with the respondents to do such work in the way of altering, repairing, and painting the respondents' stations in the London district as they might be directed to do by the district engineer at a fixed schedule of prices. Messrs. Perry and Co. were engaged under this contract in reconstructing Hampton Court Station, and the appellant was employed by them on the work. While so employed the appellant was injured by an engine belonging to the respondents. The appellant contended that the respondents, though not his employers, were liable under section 4 of the Workmen's Compensation Act, 1897, to pay compensation. The County Court judge held that the respondents were not liable to pay compensation, because the operation of section 4 was excluded by the clause at the end, the building of a station being "no part of or process in the trade or business carried on by" the railway company, but being "merely ancillary or incidental" thereto. He therefore made an award in favour of the respondents. He also found that the accident arose "in the course of" the appellant's employment, but did not arise "out of" his employment. Upon the ground also he decided in favour of the respondents. The Court dismissed the appeal. Lord Justice Collins said that, in his opinion, the learned County Court judge was right. Lord Justice Vaughan Williams and Lord Justice Romer concurred.

floor, and 9in. thick above. This is necessary according to the local by-law. The adjoining owner now builds, and under the same conditions requires the party wall to be of the same thickness for his building. Can I make him pay for 7in. in basement and ground floor, or is he right in stating that he only pays for 4½in. all the height (the 14in. is half on his land and half on mine)? Can you give me any cases on this matter? (2) Can a landlord give notice to quit if he writes on a Saturday and the tenant receives it on a Sunday? Sunday being quarter day, Monday would be too late. Would the tenant be bound to have it on the Saturday?"

(1) There is, apart from statute, or custom, or contract, no obligation on an adjoining owner to contribute anything to the expense of building a party wall such as that referred to in our correspondent's query. The London Building Act, 1894, section 87, provides for the contribution to be made by each owner when the wall is built partly on the land of each and with their mutual consent. A custom to contribute to the expense of erecting a party wall was set up and proved in *Robinson v. Thompson* (1890, 89 T.T.J., page 137, cited in "Hudson on Building Contracts," 2nd edition, p. 144). If there is neither a statute nor a custom regulating the matter in the particular locality, it will have to be determined by contract between the

Bricks and Mortar.

APHORISM FOR THE WEEK.

"And if, indeed, there be any profit in our knowledge of the past, or any joy in being remembered hereafter, which can give strength to present exertion, or patience to present endurance, there are two duties respecting national architecture whose importance it is impossible to overrate: the first, to render the architecture of the day historical; and, the second, to preserve, as the most precious of inheritances, that of past ages."—JOHN RUSKIN.

Our Inset Sheets.

THE illustrations of Caldecott House, Abingdon, show the present appearance of what, in the year 1730, was a small

farmhouse. This, though partly spoilt in recent years by additions which have now been mostly removed, was possessed of considerable charm, and the endeavour has therefore been made, in designing the new house, to follow as far as possible the characteristics of the original building. The materials used were: for the walls, local stone with thin red-brick dressings; for the roofs, old sand-faced tiles. Mr. W. L. Lucas was the architect, and the whole of the works were executed by Messrs. Prestige and Co., of London. The house for H. Richards, Esq., at Windermere, is proposed to be built in local stone, cement rough-cast, and local green slate roofing. The garden on the south-west side of the house was to look over a steep and thickly-wooded incline, with the lake below; the entrance being kept on the north-east side for protection from the weather. Mr. Voysey is the architect. The designs for four developments of one plan for a house costing £1,000 are by Mr. James Ransome, of London, and are based on some smaller houses of his planning at Wimbledon, Broadstairs, and Haslemere, &c. The sketches illustrate some possibilities of very varied treatment applicable to a plan in itself plain and square, while the arrangement of the rooms is interesting as showing the amount of accommodation that may be contrived within a very limited space. As such the sheet is suggestive.

Clayton Hall.

THE Manchester City Council has decided to restore Clayton Hall, near Droylesden. It is

one of the oldest of Lancashire mansions and was bought by the Corporation so long ago as 1896. Long ago the Hall relapsed into a state of ruin, and with the Parks Committee it was a serious question what should be done with this new possession. For a time the suggestion held that it should be pulled down, and that the space so cleared, with the acre and more of land around it, should be used for a recreation ground. But it was a suggestion that held for a short time only. The members of the Lancashire and Cheshire Antiquarian Society, and many others who were neither antiquarians nor archaeologists, felt that it would be an act savouring far too much of vandalism to destroy a house which for so many years was the home of Humphrey Chetham, the "chapman" (as in old deeds he is called) who has left a greater impression than any other man on the life and being of Manchester. The committee decided first of all that they would have a report from an architect, and it was natural that Mr. Alfred Darbyshire (Messrs. Darbyshire and Smith) should be asked to undertake the duty. Mr. Darbyshire, it will be remembered, was the architect of "Old Manchester and Salford" at the Jubilee Exhibition held in 1887 at Old Trafford. That was one of the most delightful sections of the show, and it was especially remarkable on account of the Humphrey Chetham memorials which were brought together under a common roof. Mr. Darbyshire reported that he could give to the Hall much of the look of old days, and could so stay it and preserve it that for generations to come it would remind citizens of that older Manchester which has passed away. The report has now been adopted.

The Building as it is To-Day.

As it now remains Clayton Hall is surrounded by a moat—more complete and perfect than any other which remains to Lancashire ancestral residences—from 30ft. to 70ft. wide and 10ft. deep. Mr. Darbyshire proposes to fill the deep ditch with water from the mains which connect Manchester with Thirlmere Lake, and so enhance the appearance. The bridge over the moat is of masonry and consists of two beautiful arches, with triangular embrasures on each side of the parapet. When we reach the Hall this relic is found to consist of a wing occupying the north-eastern side of the moat. It represents English domestic architecture of three distinct periods. The earliest portion is first approached on the moat side and may be considered as belonging to the timber-framed work of the late fourteenth or early fifteenth century. It is similar to and coeval with the earliest portions of Ordsal Hall in Salford. Against the gable end is a fine example of a characteristic chimney stack in ashlar masonry of red sandstone. Both this and the gable end have been much mutilated; but enough remains to point the way to a complete restoration. Alongside this oldest portion a strip has been added on the south-west side containing a timber gable and bell turret, with entrance doorway and corridor from which the old portion is entered. This addition is of such a character as to point to the fact that it was added in Humphrey Chetham's time—that is, in the seventeenth century. Built against the northern end of this block (composed of the early and later timber-framed architecture), and in continuation of the garden front, is the last block of the more modern architecture of the Georgian era. This is built of bricks, with the main angles strengthened by red quoins stones. The window openings are poor in character and in degraded contrast to the beautiful wood-framed mullioned and transomed lights of the older portion of the building. The bald, uninteresting brick front of this Georgian portion is covered and rendered picturesque with ivy growth, which it is hoped may be retained without injury during the work of restoration. There can be no doubt that Clayton Hall as it now stands represents one wing only of a quadrilateral plan; indeed, foundations have been traced which clearly prove this to have been the case. The general plan was similar to that of Ordsal Hall, where during the work of building the new church of St. Cyprian, the whole of the foundations of the third side, or missing wing, were laid bare.

"Offley Holes," Hitchin.

"This house, which is illustrated on one of our inset sheets this week, occupies a site high up on hilly ground, and in considering the design and the laying out of the grounds the problem to be faced lay in the fact that the land fell steeply from south to north. The illustration shows the south side of the house, where a garden, sheltered from the prevalent winds, has been cut out of the slope of the hill, advantage being taken of the rise of the ground to form a series of terraces. The site falling also from west to east suggested the planning of three floors to the office wing, kept balanced with the best part of the house, which is only two storeys high. The ground floor plan shows the internal arrangement, the object of which was to protect the reception rooms as much as possible from the north. A solid oak screen across the whole width of the south end of the hall divides it from the loggia, which gives access to the garden and affords a sheltered sitting place for enjoyment of sun and air. The doors from dining room and drawing room to loggia, as well as the various doors to hall, together with the main staircase, are in oak, fumed and waxed, with specially designed wrought-iron furniture. The chimney pieces in the drawing room and hall are of Ham Hill stone, with open brick fireplaces; both these rooms have open timbered ceilings. The house is built of thin red bricks from the contractor's own brickyard; the loggia is in blue Bath stone. Mr. W. L. Lucas, of London, was the

architect. The whole of the works, including lead rain-water heads, were specially designed and executed by the contractor, Mr. J. A. Hunt, of Hoddesdon, Herts.

The Statues on St. Paul's Cathedral.

THE work of replacing the old statues of the Apostles on St. Paul's Cathedral is making good progress. The statues have been in position for 200 years, and those of St. Philip, St. Andrew, and St. Bartholomew, on the south pediment, are the first three to receive attention, for the disintegrating elements of the city's atmosphere have so eaten into certain portions of them that they have become positively dangerous, while for years their features have been altogether unrecognisable. Their successors have been modelled exactly on the lines of the existing statues, the only difference being that they have been built in three sections instead of five. The new effigies have been executed by Messrs. Farmer and Brindle, of Westminster Bridge Road, and when it is realised that they weigh something like seven tons apiece it will be understood that the works department of the Cathedral, under the direction of Mr. E. J. Harding, has a task of no little magnitude to accomplish.

Rebuilding of Khartoum.

SOME interesting particulars of the rebuilding of Khartoum were given in the "Times" for Wednesday last by their special correspondent in the Soudan, who says:—"Another considerable work undertaken by the Government has been the rebuilding of the cities which the Dervishes had destroyed or had allowed to decay. Of these by far the most important was, of course, the rebuilding of Khartoum, involving as it did the transference of the seat of government from the Dervish city of Omdurman. . . . The whole city has been laid out on a metropolitan scale. The river front along the banks of the Blue Nile is more than three miles long; the depth inland is nearly a mile and a half. The public buildings lie along the river bank. At the extreme south-east the Gordon Memorial College, a large red-brick structure with shady galleries and porticoes, covering three sides of a square, has far outstripped its scholars, and in a few months it will be ready for work. In the centre of the lines, on the exact site of Gordon's palace, rises the palace of the Governor-General, now practically completed. It is a handsome Venetian-looking red-brick edifice, with white stone arcadings; the façade overlooks the river; the open court, flanked by two wings, looks out over the city across a spacious garden in which there still flourish a few of the old palms and lemon trees of Gordon's day. Further north-west are other large buildings which will soon be finished—the Government offices and the supply and ordnance stores. The road in front of them will be flanked throughout by a stone river-wall. Parallel with this imposing river front run several long avenues—Sirdar's Avenue, Victoria Avenue, Shasia Cromer. These are regularly crossed by main streets not less than 90ft. wide. The blocks thus formed are further intersected by diagonals, the cross-roads forming the key-points of the city for purposes of defence in such a way that four Maxim guns could control the whole interior of the city. Near the north-east corner of the river front there is being rapidly built by British capital the hotel which at the end of their long desert journey will receive the weary visitors to the capital of the Soudan. Nearer the centre of the town are the shops, restricted to the quarter round the 'sook' or bazaar, and close at hand a covered market on Indian models is about to be built in 'Abbas Square.' A mosque and an English church are also to be erected at Government expense, and the Christian cemetery of the Austrian mission, which had been utterly wrecked by the fury of the Dervishes, has been restored and the gravestones replaced by Colonel Drage's care. Outside all these buildings on the desert front a line of defensible barracks with redoubts will be drawn along the narrow arc from Nile to Nile."

Sir William Richmond on Art and Artists.

SOME interesting remarks were made by Sir William Richmond at the opening of the West Ham picture exhibition last week.

"I wonder whether," he said, "it strikes everyone in this room what an artist is, and what art means, what the life of an artist is, and what his aspirations are?" Sir William described the artist, in the first place, as gifted with keen perception for all that is beautiful in nature, and not only all that is beautiful in nature, but also for all that is beautiful in thought. "I hold," he added, "that besides being the exponent of nature from the point of view of painting, he is also the exponent of nature from the ethical side. Think of what powers he has! Think of the illustrations that he can put before the mind's eye and the mind!"

The artist, Sir William went on, noted the leading episodes in literature, poetry, music, and art. He illustrated the events passing under our own eyes. He was the great exponent of history. "I do not think that is quite understood. I think people are apt to think an artist is a flipperty-jipperty gentleman who amuses himself from dawn to dark by putting pretty colours on the canvas. But to be a real artist means very serious business indeed. It must be begun when you are quite a child, and you must go on learning until you are old. The most touching illustration of that is when that greatest of all artists, to my thinking, Michael Angelo, was an old man. Some one said to him, 'what is your motto?' and he replied—he was then nearly ninety—'Well, I am still learning.'"

From a consideration of the barren waste which the world would be without artists, without literature, without music and painting, all which tended to the refinement of our sensibilities, the ennobling of our ideas, the raising of us above the commonplace, Sir William passed on to talk about the arts of peace and the arts of war.

Now what were the arts of peace? They ennobled us by presenting the most beautiful features of God's work in pigment. A painter found himself in a country and sat down before a beautiful subject and recorded it for ever. It might be but a passing, fleeting thing that he had seen—nothing but a cloud passing over the distance—but this impressed his mind so definitely and entirely that he felt bound to record his impression. That was an ennobling occupation. And, to take a broader view of art still, let them regard it, not only as to statues, buildings, pictures, but as to handicrafts. The London County Council were doing admirable work in their technical schools, and the artisans had now the opportunity, never before enjoyed, of cultivating what he believed to be the underlying talent in almost everybody—the talent for cultivating the arts of peace.

On the subject of this latent talent for art, Sir William proceeded to make an interesting statement. He prefaced it by the remark that, as the result of a good deal of experience with young children, teaching them drawing and other things, he had come to the conclusion that almost everyone had hidden away somewhere an artistic faculty. He gave next a striking illustration in support of that belief. When he was asked to begin designs for decorations at St. Paul's, he said he would employ English labour only, and that he would not employ foreign labour. He was laughed at. He persisted, and said he would go to the English artisan and get him to do the mosaics. He was told he would have to go to Italy for his workmen, to Venice, where there was a firm supplying mosaics who had been engaged in the work ever since the sixteenth century. Well, what happened? He got together some five or six men who had never drawn a line in their lives. These men had had a simple, ordinary education; reading and writing, and so on; and did not show the slightest artistic faculty when he started them to work under his instructions. He told them what to do and they did it. The result was

that the 15,000 to 18,000 sq. ft. of mosaics in St. Paul's were the handiwork of these men, who had never had a single half-hour's teaching in the arts at all. "I did not pick these men," he added, "I took them haphazard, and the result is a proof of my belief that *we* are the most artistic nation. I believe that in another fifty years time we shall be the foremost artistic nation in the world, speaking generally. Our technical schools have not been at work so long as the German. Qua workmanship, the German worker may be better in some respects in consequence, but qua design, the German is a long way behind our artisans."

Among other things, and in illustration of the artistic talent sometimes found under the most discouraging circumstances, Sir William told the following story about an artisan's son. "I know a boy," he said, "about fifteen years of age. He works in a factory for eight or ten hours daily. He draws or paints in his meal times, at night, during his holidays. If he has a herring for lunch he will draw it before he eats it. So with an apple or anything else. His perception is so quick, and he must put his impression down at once. That boy comes to my studio about every third or fourth Sunday. I am then amazed at what that boy has done in his spare time. He does most extraordinary work." Sir William added that he would not yet encourage the lad to throw up his work, but as soon as he could earn by painting as much as he was earning at his trade he should say, "Yes, be an artist." That boy's name should get its place on the roll of fame.

Sir William concluded with a few remarks on the dignity of labour. He always thought that one of the wisest texts of the Bible was: "Whatever thy hand findeth to do, do with all thy might." There was to-day a tendency, from which artists were not free, to scamp things. There was such an enormous demand for instantaneous and rapid supply. That was a danger. He thought we should always keep before our minds the fact that labour was dignified. If a man could find pleasure in his work he was the happiest creature it was possible to imagine.

New Patents.

These patents are open to opposition until May 21st.

1899.—Ventilating Rooms.—5,566. A. HINTERBERGER, Vienna. According to this invention perforated pipes are arranged around the room and connected by branch pipes with a suitable supply of fresh air under slight pressure, produced by fans or other means. It is claimed that the air is thus admitted freely and without draught.

Artificial Stone.—5,603. E. COULON, Blaton, Belgium. Sand and lime are mixed in certain proportions and then crushed thoroughly. The mixture is placed in moulds, which are themselves placed in digesters. Here they remain under great heat for six hours at least, and an electric current is passed through the mass for the purpose of producing chemical action. The moulds are then withdrawn, and when the stone has cooled it is said to be extremely durable.

Spirit Levels.—7,134. J. R. WOOD, Glasgow. The tube is filled with a fluorescent liquid (such as eosine or fluoresceine dissolved in alcohol or water) in combination with a mirror, white, black, or coloured background. In this way the bubble does not receive the light which the surrounding surface of the liquid receives, and can therefore be seen well in dark or foggy weather.

Brickmaking Machines.—7,746. J. KAY, Accrington, J. LOBLEY, Ramshotton, and H. BUNKALL, Baxenden. The object of this invention is to automatically spray each brick with oil or other lubricant whilst passing from the shaping mould to the pressing mould. The device consists of a supply cistern with pipes leading to a point where the brick is to be sprayed, and pipes through which cold or hot

air or steam is forced to effect the spraying. The spray is automatically cut off by a slide plate controlled by the crank of the machine.

Portland Cement.—8,210. W. E. HOPPS, Scarborough. The following cement is claimed to be harder setting and more durable than the ordinary article: Pure chalk, dried and ground to fine powder, 123lbs.; pure silica (such as clean sand, flints, or a very sandy clay or mud), ground to a fine powder, 26lbs.; carbonate of soda similarly ground, 5lbs.; sulphate of lime (gypsum) similarly ground, 4lbs. The mixture is made into bricks, burnt, and ground in the usual way.

Gas Lighting.—10,506. W. T. SUGG, London, S.W. Between the end of the gas supply pipe and the burner a sealing device is placed, by means of which the gas supply pipe is automatically sealed when the gas is turned off at the main. The service pipes are thus kept full of gas, so that when a burner is lighted there is no preliminary outrush of gas, which is deleterious in incandescent lighting.

Walling, Flooring and Roofing.—22,511. G. E. CLARE, Chelmsford. The object of this invention is to cheapen and facilitate the construction of concrete walls, floors and roofs by inserting timber framework, made fireproof and damp-proof, so as to comply with the Local Government by-laws. After the framework has been erected, the spaces are filled with coke breeze, clinker, or other concrete by means of sectional removable battering.

The following specifications were published on Saturday last, and are open to opposition until May 28th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—4,360, VEDOVELLI and PRIESTLY, apparatus for use in electric traction on the conduit system. 6,884, WOOD, fireplaces and furnaces. 6,919, DUNCAN and NEW INCANDESCENT (SUNLIGHT PATENT) GAS LIGHTING CO., LTD., incandescent bodies for gas lighting. 7,374, KINSEY, apparatus used for generating and storing acetylene gas. 7,468, BAYLES, DE SAUSSURE, and HERRON, pipe pliers. 8,084, BAKER, moulds for making concrete paving or blocks. 8,128, MALONEY, manufacture of cements. 8,317, VAUGHAN-SHERRIN, manufacture of varnishes, drying oils, enamel paints, and wool washes. 8,402, PLANET, apparatus for the production of acetylene gas. 8,407, SPOONER (*Beaufils*) shop-front and other shutters. 8,468, BOHLE, BOHLE and PHILLIPS, arc lamps. 8,599, MACDONALD, acetylene gas lighting torch. 9,434, STOCKWELL, electric arc lamps. 9,634, KEITH, hydraulic rams. 9,836, BENTON and BENTON, locks, fitted with both locking and latching bolts. 9,923, MANTLE, sleepers for portable and other railways and tramways. 10,353, LIVERSEDGE and BEAMAN and DEAS, LTD., refuse-destructor, furnaces. 10,364, BRIGHAM, appliances for the prevention of down draught in chimneys. 10,460, GREEN, construction of wrought metal brackets. 11,270, GRAYSON and SPATLY, brick for building and other purposes. 11,312, MACKAY, ventilators. 12,967, WEATHERILL, catches or fasteners for windows, shutters, and doors. 23,863, JOHN ELRICK, JOHN WILLIAM WHITE, WILLIAM FERGUSON, ERNEST HERRON, WILLIAM BATES, WILLIAM DODD, and WILLIAM ADAM FAIRBAIRN, joint for clay, stoneware, cast-iron, and brass pipes. 25,171, ABERCROMBIE and SYMINGTON, machines and apparatus for manufacturing incandescent lighting mantles. 25,768, ROWNTREE, electric lifts or elevators.

1900.—916, BOULT (*Kiebbé*), apparatus for use in opening and closing hinged windows, frames, &c. 982, DEIDRICK, attachments for printing presses for decorating pottery ware, glass ware, &c. 1,205, SEVERIN, manufacture of hollow glass articles. 1,633, HEERDT, mould for use in glass blowing. 1,931, WERNER, ceramic material. 3,268, LAWSON, knobs for doors. 3,334, LACHMAN, frames for containing pulleys. 3,349, DYMOND (*Vereinigte Pinselfabriken*), method of making paint brushes. 3,372, FERGUSSON, locks. 3,374, FERGUSSON, locks. 3,375, FERGUSSON, padlocks. 3,580, JANZ, incandescent bodies for illuminating purposes.

Professional Practice.

Anstruther, N.B.—A new school for the school board of Anstruther Easter is shortly to be erected here from designs by Messrs. Williamson and Inglis, architects, of Kirkealdy and Edinburgh, which were submitted in open competition and placed first in order of merit by Mr. Wilson, architect to the Edinburgh School Board. The school will accommodate 320 pupils and the plans show a corridor running from end to end from which five classrooms are entered, two or three of these being divided by movable partitions; the corridor also gives access to teachers' rooms and cloak rooms. The cost is estimated at about £3,000.

Arncliffe, Headingley.—The stables for J. E. Bedford, Esq., of which a perspective and a plan are given on this page, were designed by Mr. Francis W. Bedford, of Leeds, and

both on a layer of cement concrete. The cattle pens, capable of holding about 500 beasts, are of wrought-iron rails fitted to strong cast-iron posts, eight of the pens being roofed in for store beasts. They are all paved with blue brick on edge, and the roads and gangways with granite setts. There are weigh offices, a public room for salesmen, and lavatory accommodation to add to the general scheme for assuring convenience. The plans were prepared by Messrs. Cossins, Peacock and Bewlay, and the contract has been carried out by Messrs. T. Lowe and Son, of Burton-on-Trent, whose tender worked out at £1,523.

Bristol.—A new chancel and organ chamber have been erected at Holy Trinity Church, Kingswood, from designs by Mr. E. H. Lingen-Barker, of London, Bristol and Hereford. Messrs. Cowlin and Son, the contractors, were able to utilise a part of the east-end walls, from which a new building has been extended for a distance of 12ft. A large new east-end

power) are other features of the renovation, as well as new choir stalls and prayer desks. The total outlay is £2,200.

Knowle, Birmingham.—A new organ-chamber, new clergy and choir vestries and a new lectern have been provided at the parish church of Knowle. Messrs. Collins and Godfrey, of Tewkesbury, were the builders, and Mr. J. A. Chatwin, of Birmingham, was the architect. The organ and choir have been transferred to the chancel, and the north chapel, with its beautiful traceried window, has been opened out to the church. The fine old stalls, which were originally in the nave, but of late had been fixed at the end of the south aisle, have been removed to a more convenient place. The work of restoration has revealed the existence of a piscina and ambry, which tend to show that long ago there was a chapel in connection with the Knowle Guild in the south aisle. The new vestries are commodious, and well lighted with traceried

were built in 1893. The lower part is of brick, and the roof is covered with stone slates, which are of a very beautiful colour.

Birmingham.—The new cattle market which the Corporation has provided in Montague Street will be ready for the cattle-slesmen by the end of this month. Originally the site had the disadvantage of being divided into two parts by the course of the River Rea. This objection has been overcome by covering the channel of the river with an arched brick and concrete floor carried by steel girders, the space thus covered in being utilised for market purposes. The extreme length of the land is 390ft., the extreme width 212ft., and the area 6,179 square yards. The sheep and calf pens, which are arranged close to the boundary wall of Montague Street, are covered by roofs carried by cast-iron columns, being low-pitched and covered with slate towards the south, and of steep pitch and glazed towards the north—an advantage of construction which ensures light and affords at the same time a protection from the heat of the sun. The sheep pens are laid with granolithic paving and the road and gangways with granite setts,

window has been provided which, it is hoped, may eventually be filled with stained glass, and similar windows have been erected on each side of the choir stalls. The vestry has been extended in height, so as to be uniform with the new organ chamber, and in the latter building a suitable instrument has been placed, which will be replaced later by a new instrument at a cost of £400. Wide arches have been erected on each side of the chancel and the whole east-end arrangement has been dealt with very liberally. The nave has been floored with wood blocks and the old inconvenient pews taken out and replaced by modern seating arrangements. The old flat roof has also disappeared and in its stead a new conical roof has been substituted. The old inconvenient north entrance has been done away with, and the porch recess has been formed into a baptistery, to where the font has been removed. By removing the partition in front of the gallery, and providing extra seating accommodation at the west end, the interior has been given a much more uniform appearance, and in the belfry end the main entrance is provided. New heating apparatus and new lighting by Welsbach lights (100 candle-

STABLES, ARNCLIFFE, HEADINGLEY, LEEDS.
FRANCIS W. BEDFORD, ARCHITECT.

windows. The cost of the restorative work has been between £900 and £1,000. The lectern is of the eagle type and of brass.

A New Methodist Church at Whitehead, Belfast, is being built from the designs of Mr. H. Sykes, M.S.A., of Belfast. Mr. D. Barbour, of Whitehead, is the contractor.

Views and Reviews.

STAIRBUILDING AND HAND-RAILING.

This is a thoroughly practical work, not written to put forward any particular theory, but combining the good points of all its fore-runners and presenting a clear and connected course of instruction for the artisan as well as for the architect in all that pertains to the designing or construction of wood and stone stairs and handrailing. The three parts into which the work is divided deal respectively with wooden staircases, handrailing, and stone stairs, and there is an appendix of thirty-eight pages containing useful problems in practical plane and solid geometry. A novel but important addition to the first part consists of instruction in setting out ship stairs. While this information is useful to the artisan who aims at being proficient in all branches, it is quite useless to the architect, who would doubtless have preferred to find a section on iron staircases. The first chapter opens with a glossary of technical terms, with descriptive definition of each, and illustrations where necessary. This is followed by a classification of the various forms of stairs; first we have the two main divisions of straight stairs and turning stairs; then the division of the latter class into quarter-turn, half-turn, three-quarter-turn, and one-turn stairs, according as the whole change in direction between the first and last riser is one, two, three, or four right angles. They may be classed also as newel stairs and geometrical stairs, the former subdivided again into dog-legged and open-newelled stairs, and the latter into turning stairs, circular and elliptical stairs. The general principles to be kept in view in designing and planning stairs are then enunciated and several practical points are discussed, such, for instance, as the best width of flight, the number of steps in a flight, the pitch of the stairs, the position of winders, the proportion of tread and rise, the headway, the kind of wood used and the strength, the lighting of the staircase, &c. A simple straight stair with close string is taken as the first example of construction, and every detail is carefully explained and illustrated, including the templates and scribe lines required by the joiner in setting out the work. The same method is followed with a quarter-turn newelled stair, with winders at starting, and the advantages of balanced steps are pointed out. This example introduces various difficulties to the tyro, such as the connection of the treads and risers to a cut string, and the method of forming the easings or curves in the strings where the winders come. In Fig. 71 the balusters are shown dovetailed into end of tread in the ordinary way, but a screw is added to each; this screw is not usually put in, is not wanted, and, being in the end grain of the wood, is of little value. It is rather difficult to describe upon paper the putting together and fixing of a stair with winders, but this is made clear by the authors, who have evidently had workshop experience besides being able to express themselves clearly. Dog-legged and open-newel stairs come in for similar treatment, and the framing of supports at the landings. Chapter VI. brings us to the consideration of geometrical stairs, which are more difficult to set out and also to execute, some of the parts being necessarily of double curvature. A very good illustration of the use of balanced steps is given in the plan of a half-turn geometrical stair with winders in the half space. Different methods are given for graduating the ends of the steps in "balancing," and the advantage over radial winders is very evident. Various modes are shown for the construction of wreathed strings, and the preparation of the moulds is fully described. The two chapters on ship stairs show some of the difficulties of planning stairs in confined spaces, and furnish admirable illustrations of graceful curved work in this connection. Part II., on handrailing, requires a preliminary acquaintance with practical geometry before it can be turned to account. What is known as

the cylindrical system is described both by the method of bevel-cut and square-cut, and the operation of preparing wreaths and scrolls of all kinds is elaborately shown. In Part III. the construction of stone stairs is dealt with, including steps built in the walls at both ends; built in one end and supported at the other, as open newel stairs carried on arches and columns; and built in one end and free at the other, or ordinary geometrical stairs. The use of moulds in working the individual steps is shown, but the authors are evidently more at home in joinery. The artisan who wishes to make use of the book will do well to study the appendix first. This contains many useful problems in practical geometry, simple plane geometry, and the more difficult descriptive geometry, where the mysteries of traces and intersecting planes are dealt with. In conclusion, a word of praise is due to the publishers for the paper and style in which the book is issued. H. A.

"A Treatise on Stairbuilding and Handrailing." By William Mowat, M.A., and Alexander Mowat, M.A. London: George Bell and Sons.

Keystones.

At Winchester Cathedral a new altar cross has been erected from Mr. Bodley's designs.

A New Infirmary at Willesden, N.W., is being erected at a cost of nearly £100,000. Accommodation will be provided for 400 patients.

Mr. William Emerson, Pres. R.I.B.A., informs us that he was born in the year 1845, not 1855 as stated in our "Men who Build" article in the issue for April 4th last.

The Restoration of the Bloody Tower in the Tower of London is now completed, all but a few repairs to a turret; the repairs to the lieutenant's lodgings are also finished.

For stealing 314 slates, a plasterer named Chandler was recently sentenced at the Cardiff Quarter Sessions to three months' imprisonment with hard labour; he was also sentenced to a similar term of imprisonment for stealing a quantity of lead.

For a New Wesleyan Chapel and School near Wakefield the plans of Messrs. Garside and Pennington, architects, have been selected in competition. The buildings are in the late Gothic style, with a tower and spire to the Leeds and Wakefield main road.

Metropolitan Asylums Board.—At last week's meeting of this Board the plans for the erection of the proposed Southern Hospital were approved and adopted. Messrs. Treadwell and Martin, architects, were instructed to prepare plans and specifications for certain building works.

A Claim for Revolutionising British Sculpture.—In the South London Technical Art School's annual report, Mr. John Sparkes, the superintendent, claims that the school has done much towards revolutionising the art of sculpture in this country, and has contributed largely towards influencing the taste of France and Germany in their plastic ideals.

Church Crafts League.—The address of the newly-formed Church Crafts League, of which the Bishop of Rochester is president, is now at the Church House, Westminster. Lord Balcarras, M.P., has joined the committee. Mr. Ruskin had consented to become a patron of the League only a week or two before his death. Other patrons are the Archbishop of York, the Bishops of Bristol and Stepney, and Mr. G. F. Watts, R.A.

Restoration of Crediton Church.—The committee appointed for the completion of the restoration of Crediton Church, which work was commenced about eleven years ago, has recently accepted the tender of Mr. W. Dart, of the Ecclesiastical Art Works, Crediton, for the erection of new chancel stalls in English oak, at a cost of £350. The designs are by Messrs. Tait and Harvey, architects, of Exeter. Tenders were received from three other firms. The work which Mr. Dart has already done at the church has given every satisfaction.

The Lunatic Asylum at Blackadon, Plymouth, is to be extended at a cost of £32,500.

Profitable Electricity.—The St. Pancras Vestry made during the last year a profit of £6,841 on the electric light supply.

A Six-light Memorial Window at St. John's Church, Redland, Bristol, has been erected from designs by Mr. T. W. Camm, of The Studio, Smethwick, near Birmingham.

New School at Cwmaman, Aberdare.—A new boys' school has been built at Cwmaman by the Aberdare School Board at a cost of £2,918. The architect was Mr. T. Roderick, and the contractors were Messrs. J. Morgan and Sons.

Walsall's New Municipal Buildings.—Between eighty and a hundred plans have been sent in by architects in the competition for the erection of new municipal buildings. Mr. J. M. Anderson, a former president of the R.I.B.A., is the assessor.

New Board Schools for Birkenhead.—The Birkenhead School Board have purchased a site for the erection of new Board schools in Woodchurch Road to accommodate about 1,000 children. They have also appointed Mr. T. Taliesin Rees, F.R.I.B.A., of Birkenhead, to carry out the work.

Wanton Damage to a Church.—The Halifax police are making enquiries into a singular act of wilful damage committed at Heath Congregational Church on April 7th. About twenty panes of stained glass in the windows of the church were broken, and also the windows of the lamp outside.

New Church for Eastbourne.—It has been decided to erect a new permanent church for the Ocklynge district in the old parish of Eastbourne. Plans have been adopted, and it is intended to proceed with the building of a nave and aisles as soon as the necessary funds, about £7,000, are forthcoming.

In the Adam Smith and Beveridge Memorial Halls, Kirkcaldy, given by Mr. and Mrs. Andrew Carnegie, of Skibo Castle, an organ is to be erected by Mr. Hope Jones. The case, which is in three parts, is being designed by Messrs. Williamson and Inglis, architects, of Kirkcaldy, who are also superintending some slight structural alterations to the buildings. The cost will be £3,000.

Bristol Society of Architects.—The annual general meeting of this society was held last week, Mr. W. L. Bernard presiding. The report for the session was presented to the meeting and adopted. A satisfactory increase in membership has taken place during the past year. The voting for officers resulted in Mr. Frank Wills being elected president, Mr. G. H. Oatley and Mr. Joseph Wood (re-elected) vice-presidents, and Mr. H. Dare Bryan, hon. secretary and treasurer.

Additions to the Mint.—A new die and metal department is to be added to the Royal Mint, and the necessary excavations are now being made. The Mint stands on the site of the ancient abbey of St. Mary of Graces, or Eastminster, which, in its size and the extent of its precincts, is said to have rivalled that of Westminster. The excavations have disclosed what are supposed to have been part of the old chalk foundations of the "Eastminster," or "East Minster," and two moulded stone doorway jambs of Norman transitional work, but the latter not *in situ*.

The Bradford City Council, at its meeting last week, decided to accept tenders for the Cartwright Memorial Hall amounting to £51,470 9s. 7d. They are as follows:—William Farnish, excavator, mason, and bricklayer, £38,335; W. H. Pick, carpenter and joiner, £5,915; Braithewaite and Co., plumber and glazier, £1,320; J. Hankin, painter, £210; Hill and Nelson, slater, £179 15s.; T. Cordingley and Son, plasterer, £2,140; R. H. Dewhurst, iron founder and smith, £3,382. A recommendation that an additional wing, consisting of two blocks of buildings, should be erected on the north-east side of the Leeds Road Fever Hospital, to accommodate sixty or seventy beds, was adopted.

Trade and Craft.

Office Fitments.

An American roll-top desk is a very useful piece of furniture, and an American file cabinet is a laudable improvement on the old-fashioned dust-collecting letter bundles. All kinds of these office fitments can be obtained from Messrs. Thomas Turner, Ltd., of Leicester and 44, Holborn Viaduct, E.C., for whom they are manufactured by the Globe Company, of New York, Chicago, and Cincinnati. Any article will be sent on approval without charge, provided it is returned within a fortnight carriage paid and in good condition. The Globe "Ideal" file consists of a hardwood drawer with an open back containing an index that is held in place by an automatic spring compressor, which is the most important part of the device. The front of the drawer has rounded edges and a combined handle and label holder. Cabinets of these files can be obtained of various dimensions, from a small article to be placed on a desk to a great piece of furniture that would fill up one side of a room. The majority have vertical roll fronts and are made in quartered oak, walnut and cherry. Nests and cabinets of pigeon-hole cases, copying-press stands, and cabinets on the card-index system can also be obtained from Messrs. Turner; while the choice of office chairs, and roll-top desks is one that should satisfy the most exacting or fastidious purchaser.

Diener's Metal Cement.

It is claimed by the proprietors of this cement (Messrs. Michaelsen and Heine, 61 and 62, Gracechurch Street, E.C.) that it is six times as efficient as lead, hardens immediately after use, and does not need wedging, while it is consequently invaluable where lead and sulphur are used for embedding and similar work. It is very strong, has great binding power in its solid state, and great liquidity when molten. It offers perfect resistance against acids of any kind, and is quite unaffected by changes of temperature and climatic conditions, so that there is no danger of it loosening or cracking. As scrap and tailings can be used over and over again, the material is economical. In a recent test it was found that when an inch Lewis bolt was inserted in a block of Diener's metal cement, the bolt broke under a tensile force of 23 tons, but there was no sign of the cement having suffered any deterioration. A similar bolt was fixed in a cast-iron block, and lead was used to fasten it instead of the metal cement. The bolt broke under a weight of 21.96 tons. Manifestly it was drawn outside its block, and the lead fastening was likewise extended $\frac{1}{16}$ in. The compressive tests were equally satisfactory. A block measuring 3 in. by 3 in. by 2½ in., which was bedded in plaster of Paris before testing, was not crushed until a load of 20.2 tons was applied. As the area was 9 square inches, the compressive strength was found to be 2.24 tons per square inch.

Painters' Requisites.

Messrs. Hamilton and Co., of 116-118, Clerkenwell Road, E.C., send us a copy of their 1900 catalogue. The majority of the prices given are practically similar to those which have prevailed since September last, but others (such as the larger sizes of distemper, stock and ground brushes) are still further increased, following the advance (not yet arrested) in the price of the better-class bristles. The following alterations have been made:—The sizes of all dusters, ground and varnish brushes below 1 have been revised, and four new sizes instead of eight are now made, namely, Nos. 2, 4, 6, 8. Smaller sizes than 4oz. in tied and nailed stock and liner brushes are not stocked, and nickel-plated cases will be used in place of tin for some flat varnish brushes, fitches and lining tools as the old stocks are used up. The sizes of iron-bound glue brushes Nos. 78 and 78g have been altered, and seamless ferrules will be used as

the old stocks of brazed and riveted iron rings are exhausted. The firm is now able to make patent flat varnish brushes Nos. 0050, 0050a and 0100, lin. wide. Several catalogue numbers have been changed, and the following additions have been made:—1a, china bristle dusters; 22b, china bristle one-knot ground brushes; 050a, 50b, flat hog-hair bevelled varnish brushes 3 in. thick; 50d, flat hog-hair varnish brushes ½ in. thick; 55b, decorators' cut stencils; 073b, metal-bound German tools; 118d, camel-hair sword strippers; 149a, mat baskets, cane handles; 0153, fittings for paraffin blow lamps; 169, Day's patent safety paint-kettle hooks; 840, 870, Hamilton's patent self-locking shaving brushes; and 1550, Davison's patent ladder brackets. It may be mentioned that Messrs. Hamilton's works are at Wealdstone, R.S.O., Middlesex.

Ventilating Buildings.

We have already remarked in this column that the trade catalogue seems to be undergoing a change and is developing from a badly printed, unattractive pamphlet to the very opposite, some of the larger catalogues being excellent specimens of printing and arrangement. Though this improvement necessarily entails an extra expense to the producer, the money is well laid out, for the purchaser prefers to examine a catalogue attractively produced than one of the old school. The "Climax" Ventilating and Heating Company, Limited, of 41, Port Dundas Road, Glasgow, keeps well up with the times, and their catalogue has the praiseworthy qualities mentioned above. This firm has set itself a very commendable task, that of improving the appearance of the roof ventilator, which, occupying the position it does, must necessarily deserve the closest attention. Some of the ventilators illustrated in the catalogue now under review are most pleasing and show that great consideration has been exercised to make them as architectural as possible, while in no way detracting from their efficiency. It is claimed that "Cousland's Improved Climax" patent direct-acting ventilators will give an extraction speed of 350ft. to 400ft. per minute in a breeze of 7½ miles an hour; while when no wind is perceptible at a height of 40ft., with an excess of 10 degrees above the external temperature the same volume of air should be withdrawn. The system adopted by this firm consists of a turret ventilator on the roof with a main shaft (fitted with a regulating valve) from which branches are taken to the ceilings of the rooms to be ventilated. The rooms on the upper floor have a cone enlargement, covered by an ornamental grid in the ceiling, connected by a branch to the main shaft. Fresh air is admitted through "Cousland's Improved Climax" inlets at a height of 5ft. 9in. from the floor. The turret ventilators made by the firm are, under ordinary conditions, perfectly free from draught, and need no valve boxes below them, they are in strong gauges of best galvanised rolled steel, moderate in price, and well finished. The "Natural Exhaust" ventilator secures perfect freedom from draught in all positions without any valve arrangement, and is noiseless. "Cousland's Improved Climax" direct-acting invisible roof ventilator has been proved by exhaustive tests to be equal in extracting powers to any turret ventilator on the roof, and has an exit area double that of the pipe. The firm has supplied its ventilators to H.M. Board of Works, Local Government Board of Ireland, Imperial Court of Berlin, and to numerous hospitals, churches and other public buildings throughout the kingdom, and has obtained for them a wide reputation for efficiency, workmanship and fitness.

In Memory of the Brave.—The officers of the Manchester Regiment are desirous of decorating the new Victoria porch at Manchester Cathedral with memorials of officers and men who may fall in South Africa. It is proposed to erect stained-glass memorial windows and wall tablets.

Masters and Men.

The Ayr Joiners have struck against the masters proposed reduction of 1d. per hour in their wages.

Brickmakers in the Prittlewell and Wakering Districts have come out on strike because the masters will not agree to a 10 per cent. increase on the standard rate of wages.

The Southport Joiners have accepted a ½d. advance in wages in two instalments—in May and August—in place of the 1d. per hour they asked for. This brings the wage up to 9d. per hour.

The Lock-out of Liverpool Joiners has been ended by the men's circular being withdrawn. The point was whether joiners paid by time should be exclusively employed in laying wood flooring blocks.

Coatbridge Joiners' Strike.—Murray's men have joined the strikers at Coatbridge rather than submit to a reduction of ½d. which was threatened, and have joined the ranks of those who have been idle for five weeks.

No Employment at the Paris Exhibition should be expected, as the Employment Department of the London Chamber of Commerce states that all needed assistance has been already obtained by the exhibitors and others.

A Painters' Union at Brechin has been formed to secure the organisation of trade in the locality, and the following branch officials appointed: President, Mr. H. Ferrier; treasurer, Mr. Smart; secretary, Mr. Mitchell; trustees, Mr. Moody and Mr. Bain.

New Companies.

Wolverhampton and Suburban Houses Company, Limited.

This company was registered on April 3rd with a capital of £13,000 in £1 shares to acquire certain freehold lands, buildings, and hereditaments in and near the borough of Wolverhampton, Staffs., to adopt an agreement with W. H. C. Walker and C. Walker, and to carry on the business of builders, contractors, carpenters, &c. Registered office 44, Queen Square, Wolverhampton.

Collins and Morris, Limited.

This company was registered on April 3rd with a capital of £3,000 in £25 shares to acquire the business now carried on by T. Collins, W. Collins, and R. Morris at Brighthouse and Lightcliffe, Yorks., and to carry on the business of quarry owners, stone workers, colliery proprietors, &c. The first directors (to number not less than three nor more than seven) are J. W. Turner (chairman), T. Collins, W. Collins and R. Morris.

Lewis, Miller and Company, Limited.

This company was registered with a capital of £300,000 in £1 shares to adopt an agreement with the liquidator of the joint-stock company of the same name, and to carry on the business of timber merchants. Registered office: Ferntower Road, Crieff.

Mr. William Watson, borough surveyor of Maybole, has been appointed borough surveyor and sanitary inspector for St. Andrews.

Tiverton Sewerage Scheme.—The Local Government Board has sanctioned the application of the Tiverton County Council to borrow £5,500 for sewerage and sewage disposal works.

New Bridge near Ossett, Yorks.—The cost of the public bridge which is to be erected over the river Calder at H.aley is estimated at £2,400. The bridge will be 150ft. long and 12ft. wide.

Steam Rollers for the Pembrokeshire Roads.—After a good deal of agitation the Main Roads Committee of the Pembrokeshire County Council have decided to recommend to the Council the employment of steam rollers on the main roads of the county.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDING—			
April 20	Boston, Lines.—Alterations to Offices, &c.	Harbour and Docks Commissioners	Engineer, Market-place, Boston.
" 20	East Finchley, N.—Sorting Office	Commissioners of H.M. Works, &c.	J. Wager, H.M. Office of Works, &c., Storey's-gate, S.W.

COMING EVENTS.

Thursday, April 19.

NATIONAL ASSOCIATION OF MANUAL TRAINING TEACHERS.—Conference at the Society of Arts.

Friday, April 20.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day on "Ornamental Design."—XIV.

Saturday, April 21.

DUNDEE INSTITUTE OF ARCHITECTURE, &c.—Visit to Messrs. Justice and Sons' Works, and to Kingoodie House. 1.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Dysart House, Ravenscraig Castle, and St. Serf's Tower.

Monday, April 23.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. Killingsworth Hedges, M.I.C.E., M.I.E.E., F.C.S., on "Protection of Public Buildings against Lightning." 8 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Anniversary Meeting at 2 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Eighth "James Forrest" Lecture. Sir William H. Preece, K.C.B., F.R.S., on "The Relations between Electricity and Engineering." 8 p.m.

Tuesday, April 24.

ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.—Quarterly Meeting and Excursions at Dublin.

INSTITUTION OF CIVIL ENGINEERS.—Sir William H. Preece on "The Relations between Electricity and Engineering," at 4 p.m. Annual General Meeting of (Corporate Members to receive Report of Council and to elect the Council and Auditors for the ensuing year at 8 p.m.

SOCIETY OF DESIGNERS.—Mr. Turbayne will show Book Decorations, and Mr. Lindsay Butterfield will show examples of his designs for Tapestry, Cretonne, Wall-papers, &c. 7 p.m.

Wednesday, April 25.

SOCIETY OF ARTS.—Ordinary meeting at 8 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Annual Dinner.

SURVEYORS' INSTITUTION.—Country Meeting at Leeds. First Day.

Thursday, April 26.

INSTITUTION OF MECHANICAL ENGINEERS.—Ordinary Meeting at 8 p.m.

SURVEYORS' INSTITUTION.—Country Meeting at Leeds. Second Day.

SOCIETY OF ARCHITECTS.—Meeting at 8 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

CONTRACTS OPEN.

HERNE SCHOOL BOARD.

TO BUILDERS, CONTRACTORS and OTHERS.

The above Board invite TENDERS for the ERECTION OF NEW INFANT SCHOOLS, in Stanley-road, Herne Bay.

Plans and specifications with form of Tender may be obtained at the offices of the Architect, EGERTON COLLARD, 12, East-street, Herne Bay, during office hours.

Sealed Tenders addressed to the chairman, endorsed "Infant Schools," must be delivered at my office on or before MONDAY, APRIL 30th, 1900.

The Board does not bind itself to accept the lowest or any Tender.

The Contractor will be called upon to find sureties for the proper execution of the work.

E. COLLARD,
Clerk to the Board.

COMPETITION.

BERKHAMPTSTED GIRLS' GRAMMAR SCHOOL BUILDINGS' ASSOCIATION. TO ARCHITECTS.

The Board of Management invite COMPETITIVE PLANS for the ERECTION of a SCHOOL to accommodate 150 girls.

Premiums of £50, £35, and £15 will be awarded to the authors of the Designs placed first, second, and third respectively, and in the event of the selected Design being carried out, the premium will merge into the commission.

The President of the Royal Institute of British Architects will be asked to appoint an Assessor to advise upon the designs. A copy of the conditions and instructions, together with site plan, may be obtained upon application to A. W. VAISEY, Solicitor, Berkhamsted, the Secretary to the Association, to whom the drawings must be delivered under cover not later than JUNE 16th, 1900.

Berkhamsted,
April, 1900.

An Architectural Causerie.

The Expressiveness of Architectural Details.

THERE is no doubt that the various forms of architecture in the main reflect not only the preferences of the various

races by which they have been employed and the character of the countries amid which they have been used, but also, to a considerable extent, the individual character of the craftsmen who have had to do with the erection and decoration of the buildings from which its principles have been deduced. The dumb stone and brick, wood and lead, have taken to themselves voices and a tongue, whereby they still speak to those who have ears attuned to their delicate harmonies, though these are often sadly spoilt and overlaid by the coarser arrangements of later times. And this expressiveness is not only to be found in general design, but also in the various parts which compose the whole and produce upon the mind of the spectator emotions of one kind or another according to the treatment which has been chosen by the designer to express his thought. It is too often the case at the present day that the design of the parts of a building is considered, principally, either from the point of view of magnificence of effect (in which vaulting ambition not unfrequently o'erleaps itself) or from that of pure utility, the architectural expressiveness of the details being quite lost sight of. Such parts as the doors, windows, roofs, staircases, porticoes, and chimneys may be made means of expression, and have, indeed, natural expressiveness if treated in a common-sense way. The wide and important doorway, for instance, may indicate hospitality and a certain magnificence of living, and certainly suggests it, especially when accompanied by a portico or flanked by colonnades which stretch out from the centre as though desiring to embrace all who approach. On the other hand, the door which is small and narrow seems to refuse entrance save to one or two, either reserving the interior of the house for a few intimate friends, or with niggardly hospitality admitting but two or three at a time; an example of this may be had from the great houses in the Canongate, Edinburgh, the entrances to which are more like openings into burrows which are made to be easily defended than doorways which give admission to houses in which cultivated men and women lived. They show in a high degree the feeling that the home is everything, once one is in it, and that the way to it matters nothing, nor is it the concern of any but intimates; or perhaps rather suggest quiet times and the fear of a forced entrance through the defences, while the larger and opener scheme, before referred to, speaks of security and crowds of guests. Windows, too, may be equally expressive. Those which are high in the wall and only of slight height suggest, first, that the concern of the dwellers in that house is solely with what passes within it, and, secondly, that they were so placed to ensure the safety of its inhabitants from chance missiles from outside, which would strike the ceiling

almost necessarily, instead of wounding the occupants of the room. The wide-windowed gallery, on the other hand, proclaims absolute security, much leisure for leaning on the sill and gazing at the landscape or at what passes without, and considerable interest in the concerns of one's neighbours—a life lived more or less in public, in fact; while the gallery is also not without the suggestion of frequent rainy weather and the need for cover under which to take exercise. And how closely suggestive is the great chimney stack of ancient times, from its mighty base, which encloses

against the over-decorated wall surfaces of the terra-cotta and moulded-brick period of a few years ago. As a means of contrast there is no doubt that a space of plain, unbroken wall may be very valuable and occasionally expressive, as in the case of a theatre set side to the street, or the outside wall of a brewery or of a great office building; but in most of these cases it is simply the bulk and extent of the wall which make it impressive, and it certainly suggests other conditions of life than those which now prevail. Thus it was that the military archi-

GLoucester Cathedral: South Walk of Cloisters. FROM A DRAWING BY JAMES M'LACHLAN.
(One of a set that won the R.I.B.A. Pugin Studentship, 1900.)

the ingle nook, up to the twisted tops, where the many flues collect and form a splendid cluster, separate yet interdependent, each one bearing its part in the general effect and speaking of warmth, comfort, and hospitality; while the modern chimney pot, poor and thin and without character, aptly reflects the meagreness and want of individuality in modern life, usually breaking out into pretentiousness and sham when the architect or builder has wished to be impressive, and thus giving another illustration of the likeness between man and the works of his hand. It has become the fashion of late years to speak with high appreciation of large spaces of plain walling—a re-action

fects of bygone times built their walls for defence, mountainous masses of materials strongly set together, and still most impressive to the beholder as they tower aloft, grey and weather-beaten with the storms of centuries, giving promise of security within their circuit from the fierce attacks of the marauder, defying fire and siege, and even not much affected by shocks of earthquake. But the conditions of life are now quite different; attacks upon our property are made at the present time in a different and less violent fashion, and it is an anachronism to make use of expedients which had their vogue in mediæval times but are not applicable to modern requirements. A. W.

The Pendant. It is the unhappy case of the inartistic that they must needs have a pair of everything. Perhaps not even those of us who arrogate the possession of culture are quite free from this obsession of balance and exact duplication, while it is quite certain that those who make no pretensions to taste are apt to be slaves to the pendant. There is, we should not forget, another side to this which has developed during the last few years and has, in the revolt against mathematical precision of duplicating parts, led us somewhat perilously near the slavish cultivation of the eccentric. These crusaders, in their campaign against the obvious would appear to have found salvation in others sins, and from exercises in the obvious to have proceeded in the direction of experiments in the undreamt-of. As in everything else under the sun, the situation is saved by adopting the happy mean. We have not far to look, nor very diligently to search, for examples of extremes in either vice. Of course the classic and homely instances are successfully to be sought in the privacy of the British domestic interior, where the cut-glass lustres in hateful pairs still flank the mantel-shelves of the dining and drawing rooms of many otherwise virtuous households. This, doubtless, is the doing of that lady of whom we hear so much—the British matron. The seed of immorality lies (to her way of thinking) in art of any sort, and so we need waste no more time in argument over her; but why, when the Briton buys the specious etching, or the photogravure of commerce, why does he generally buy them in pairs? Because he is haunted by this weird notion of the pendant.

It was this idea which led to the commission of a great crime in archaeology and architecture in the first quarter of the century which, with its enthusiasms and errors, is fast going to limbo. At that period there was an architect of the name of Austin in official charge of Canterbury Cathedral. There was also at that time an exceedingly valuable and interesting relic there in the shape of an early Norman tower at the north-west end of the cathedral. Archaeologists valued this, and in fact, it was unique. But, unhappily for archaeology and for the cathedral, the Dean and Chapter decided to demolish it and to build in its place a copy of the Perpendicular tower at the other angle. In this they were aided and abetted by the said Austin. It mattered not to those clerics or to that architect that the old tower dated back to the time of Anselm. They were determined that the two western towers should match, and that one should be a pendant to the other. They do not appear to have had any qualms of conscience about it; but were a little harassed by the thought that someone—either from the purely antiquarian point of view, or else for the mere sake of old associations—might question this proceeding, and so they gave out that the structure they were so light-heartedly to destroy was ruinous and incapable of repair, which it was not. Gone beyond chance of recall, this is an historic instance of what evil may be wrought by the otherwise well-meaning. For the sake of "neatness" and uniformity they razed to the ground that which another and a later generation would not willingly have seen disappear.

C. G. H.

On Reflection.

In Memory of Ruskin.

So long as the English language is written and spoken, John Ruskin will have in the books he has written a nobler memorial than any his friends could erect. Yet it is natural that those who honoured his memory should desire some visible emblem, not so much to keep his memory green as to express their own feelings and to demonstrate their loyal affection. Nothing could be more happily conceived than the scheme which has been set on foot for erecting a simple memorial to the Master in the beautiful Lakeland he loved so well. The spot chosen is Friars Cray on Derwentwater, a spot which made a deep impression on him as a child and of which he once said that to his mind the view from it was one of the three finest views in Europe. "The form of the memorial," says Canon Rawnsley, "has not yet been decided upon, but it is proposed that, as Ruskin was a religious teacher, and as this is Cymri-land, the memorial had better take the form of an early British Cross of native stone, so placed that it would not be a note of discord in the landscape, some simple inscription upon one side, and on the other a short passage from his writings might be inscribed. Possibly the wild rose will be introduced in the decoration, and it has been suggested that a bronze medallion portrait should be inserted, encircled by a crown of olive. All we wish for is some simple and durable memorial which shall recall the tourists who wander here in the summer to the memory of the man of our century who more than others has striven to make the love of nature a possession of the English-speaking race." Our contemporary, the "Builder," the other day sneered at "the childish worship of Ruskin," whom it stigmatised as a "sham prophet;" but we doubt whether there is any body of men by whom Ruskin's work is more deeply appreciated than it is by British architects, and probably some of our readers may wish to share in this beautiful and appropriate memorial. If so, we have no doubt Canon Rawnsley (Crosthwaite Vicarage, Keswick) will be pleased to receive their gifts.

Local Authorities and Advertisements.

A LETTER to the "Times" by Mr. Richardson Evans, hon. secretary of the National Society for Checking the Abuses of Public Advertising, raises the interesting and important question of the extent to which the London County Council should exercise control over methods of advertising. This special question suggests the larger and more far-reaching one: Should a local authority concern itself with purely æsthetic considerations, and if so to what extent? The practice of the London County Council in this respect has been somewhat peculiar. It has abolished sky-signs and—within certain limitations—search lights and lights which suddenly alter in intensity or colour. But the ostensible reason for its action is the physical danger which lurks in these forms of advertising. The sky-signs are removed lest they should fall on the heads of the citizens, and the twinkling illuminations lest they should frighten the horses; in neither case is the unsightliness of the things the acknowledged cause of their removal. The Council's attitude is no doubt determined by the fact that, whereas it is empowered to frame regulations in the interest of public safety, it would have to obtain fresh statutory powers to deal with displays that are merely vulgar and ugly without being actively injurious. Perhaps from fear of being thought unpractical or un-

businesslike, County Councillors generally seem averse from posing as the guardians of the beautiful and the picturesque. We should like to see the Council take its courage in both hands and seek from Parliament, as Edinburgh has already done, powers to control all kinds of advertising devices. There is nothing in the nature of things, so far as we know, why the local authority should not regard it as part of its duty to protect the community from the more aggressive forms of ugliness in public places.

Registration Demanded in 1835.

It is instructive to notice that the demand for the registration of architects, so far from being a modern idea, was advocated in the early days of the R.I.B.A. in order to cope with precisely the same evils as those against which the profession (or part of it) is struggling to-day. The "Journal of the Society of Architects" in its April number prints an article taken from "The Architectural Magazine" published in 1835, which, as regards the conditions of architectural practice with which it deals and the remedies it suggests, might have appeared in a professional journal of the present day. The author refers to the popular ignorance about architectural matters, to the execrable taste displayed in the erection of new buildings, and to the carpenters, ironmongers and cabinet-makers who practise as architects to the great detriment of the profession. "In my opinion," he says, "the most satisfactory consequences could only arise from the severest scrutiny being made in electing members for a society of architects; and I hope to see the days when the present Institute shall have been re-organised; the heads of the profession appointed its judges; and an Act obtained allowing no persons to be enrolled on its lists, or to practise as architects until they have passed the strictest examinations before them."

Architects and Painters' Materials. THERE is scarcely any calling in which such encyclopædic knowledge is required as in that of the architect. He is constantly being told that his education has been neglected in this particular or that. The artist tells him that he has not pursued his artistic studies far enough, the engineer points out the failures he makes through his ignorance of engineering, the craftsman in leaded glass finds that the architect's designs for stained glass windows are all wrong because he has never handled the actual material; and now we are told, by a writer in "Oils, Colours and Drysalteries," that the architect's great failing is his ignorance of the paint trade. He does not trouble about painters' materials; he will specify minutely all the work and materials to be employed in every department except the painting and decorating; here he is content with such a general clause as "All woodwork to be painted with four coats of good oil and lead paint;" to him paint is paint, and there's an end of it. The consequence of this is that the makers of painters' specialities appeal in vain to the consideration of the architect, and clients are the losers by his failure to interest himself in improved materials which are from time to time placed on the market. We have no doubt that there is much truth in these suggestions; but it must be remembered that the architect needs to give attention to so many practical details in connection with the building, that it is not surprising if matters of minor importance, such as the details of the painters' work, are apt to be neglected. Our contemporary's suggestion that a paper dealing with practical matters should be prepared and read before one of the architectural societies is a good one, which we hope will be carried out.

Ancient Halls of East Lancashire.

By W. H. B.

IN that sumptuous monograph "A History of the Ancient Hall of Samlesbury," Mr. Croston tells us that the county of Lancaster is remarkable, amongst other things, for the "many perfect and singularly interesting manorial residences it still possesses, the memorials of a social existence which has for ever passed away."

The whole may comprise the part, but never the part the whole; nevertheless, it is not an exaggeration to say that the portion of the County Palatine that is known as East Lancashire can boast of having within its boundaries the very "pick" of these ancient houses in Halls that are the crown and climax of those in the whole Palatinate. Let us name a few of them. They are Huntroyd, Hoghton Tower, Little Mytton Hall, Pleasington Old Hall, Samlesbury, Osbaldeston, Balderston, Hacking, Dinckley, Dunkenhagh, and many others. Some of these Halls are in excellent repair and are still occupied by families as ancient as those who originally held them; others are falling into decay; and others have been partly destroyed and their remaining parts transformed into farm houses. All are remarkable for the fact that they have mostly been built in the spacious times of Queen Elizabeth, or in the near reigns of the preceding or succeeding monarch. And here, again, we have an architectural and historical problem of the first interest. In a former paper on "Lancashire Church Architecture" (see issue for March 28th last) I attempted to demonstrate the fact that in the times immediately preceding the Tudor epoch there was a remarkable revival of church building, for which the historians of the county have hitherto in no way accounted. Now we find a similar problem, not in the ecclesiastic, but in the domestic sphere. The Halls which we are about to describe, many of

them of very considerable dimensions, were all built within a period comprised within little more than half a century of years. Whence the accession of wealth? Did it come from the dissolution of the monasteries, or was it the natural result of the increased activity in trade and commerce which we know characterised the earlier Tudor period? These are questions which would occupy considerable space in the answering. So we do not propose to deal with them, but merely in passing to furnish such data as may be useful in resolving them.

First as to the meaning of the term "Hall" itself, by which nearly all these buildings are designated. Webster tells us it is probably derived from a root meaning to hide, to conceal, or to cover. Whatever may have been its origin, we know it to be in use a most comprehensive term covering a wide variety of meaning. It is used to describe buildings devoted to public purposes, such as Guildhall, Town Hall, Market Hall. It is applied to public fanes of great national importance and stateliness, as Westminster Hall and Whitehall. It may be applied to the principal room of any large building, or to the chief room in a castle or manor house, and in early times to the only public room serving as a place of gathering for the family and retainers. Cooper contrasts it in this application with the *bower*, which was the name of the private or sleeping apartment, as Rosalind's bower. Chaucer says as to an ancient slattern:

"Full sooty was her bower and eke her hall."

It also designates a college, or a portion of a college at a university, and it has many other meanings. Old English country houses have many different designations, as hall, tower, mansion, manor house, grange, court, &c., but the term "Hall" is the one most in general use. Indeed, the term "manor house" seems in every case to cover not only the building itself but the occupant of it, "the lord of the manor." Throughout Lancashire, with but few exceptions, Hall is the word which is generally used for those country seats and residences which have more than an ephemeral duration and interest and have come down to us from ancient times redolent with the historic lore of a by-gone age.

I have been at some pains to discover the date at which the ancient Halls with which I propose to deal in this paper were built. In some cases they succeeded previous structures, but the remaining fabrics have in most instances on their door lintels or gables the figures of the year in which they were com-

pleted, and if these are not to be found on the buildings they may be ascertained from such books as Whitaker's Whalley, Baines' Lancashire, or the more local and parochial histories. The famous Samlesbury Hall gives its date on the Minstrels' Gallery in the large hall as 1532, though it was not completed as it now stands until 1545. Martholme, the ancient manor house of Great Harwood, dates from 1561; Hoghton Tower from 1565; Pleasington Old Hall from 1587; Osbaldeston gives 1593 on a lintel over one of the doorways; Hacking Hall was built in 1607; and Livesey Old Hall in 1608. We can find no date for the building of Little Mytton Hall, but Abram, in his history of Blackburn, gives the brief reign of Edward the Sixth as the period of its construction. In many respects it compared with Samlesbury in architectural features and style, and its principal hall was nearly as elaborate. The dates I have given range from 1532 to 1608, and the period enclosed by them is important from the fact that in it East Lancashire seems to have been studded, even in its more inaccessible parts with stately buildings fashioned in such style, from the architect's point of view, as to show that the taste and aptitude for good building survived through the Tudor times, and was only lost in the stormy and contentious epoch which followed them.

Let us consider these buildings in detail and try and discover what lessons they teach us. All are throughout well and solidly built, and all conform to the canon so rightly enforced by the late Mr. White, Fellow of the Royal Institute of British Architects, in being built of material supplied by their own localities. This is not remarkable, for in East Lancashire good building stone may anywhere be had in quantity, of the millstone grit and other varieties. The county has been denuded of the forests with which it was at one time covered, but in their day there was abundance of oak timber such as was laid under contri-

INTERIOR OF MYTTON HALL.

bution in the building of places like Little Mytton, Dinckley and Samlesbury. Only three of the buildings to which I have referred could boast of possessing the common hall with minstrel gallery of the feudal times; these were Mytton, Hoghton and Samlesbury. Of the Mytton Hall, as it existed early in the present century, I am enabled to give an illustration, for which I am indebted to that excellent work, "Views of the Old Halls of Lancashire and Cheshire," published by Henry Gray in 1893, and containing twenty-eight fine copperplate engravings drawn and mostly etched by W. G. Phillips in 1822-4. Whitaker in his "History of Whalley" says "the Hall with its embayed window, screen and gallery over it, is one of the finest 'Gothic' rooms he ever saw in a private house." But the term "Gothic" was loosely applied in his day. The ceiling of this fine interior is of oak, in wrought

CORBEL BELOW WINDOW AT SAMLESBURY.

MARTHOLME.

compartments, the principals being turned in the form of obtuse arches, their corbels, where they receive the capitals, enriched with carvings, the wall covered with wainscot, and the bay window adorned with armorial bearings in painted glass. The screen, Whitaker thinks, "is extremely rich, but evidently of a more modern style than the rest of the woodwork." Upon the panels of it are carved, in pretty bold relief two heads, male and female, within medallions, which have a rude kind of character and were evidently intended for portraits. Some of these carved heads are still on the screen, and the missing ones are now at Stanley House, near Clitheroe, where they form part of the sideboard. Phillips' fine drawing, which is that of an artist, not an architectural draughtsman, is not exactly correct in its details. The view in Whitaker's Whalley, which is of an earlier date, is more correct, and shows that on both sides of the arch in the screen the roof principals are supported by deeply fluted oak piers, which come down to the ground. On the west side one of these piers divides the carved heads or medallions, leaving four on the side nearest the centre and two on the other side, whilst Phillips' view omits these and only gives eight panels instead of ten. There are also other discrepancies on which I need not dwell at any length. We may see that in Samlesbury Hall some of these features are reproduced, as was likely to be the case in buildings erected at the same period and within a few miles of each other, on the margin, as it were, of the same fair stream, the River Ribble.

Of Samlesbury a view is given of the south-western corner, showing the quaint chimney stacks, which recall to mind one of the drawings of Mr. Railton in Mr. Hutton's "Hampton Court." They "curled their chimneys in those days, and twisted them," to use a phrase of Dickens, if they did not, like Mrs. Lirriper, "curl their smoke." These chimney stacks of the Tudor buildings have a peculiarity all their own, and are quite as pleasing and picturesque in their way as the finials of a former age, which were used to accentuate the battlements as these are to relieve the roof line and walls. One wonders why they are not more generally adopted by modern architects in an age in which our modellers can do anything in clay, and when the art of ornamental brick-making was never more thoroughly understood.

In Martholme we have quite a different style of building. Ornamental carpentry had gone out of date; half-timbered houses like Dinckley gave place to buildings wholly of stone as to their exterior portions. Instead of the one long building, with its flanking wing or wings, we have the many-gabled house, with its mullioned windows in plenty, and its more stately porch, its greater elevation, and its enclosing walls. Martholme stands amidst the meadows and pastures of its demesne near the left bank of the Calder, once a pure running stream, but now almost as polluted as the Mersey itself. It has been long deserted by the representatives of the ancient families which made it their home.

The fragmentary portions remaining serve but to suggest what the structure was like before age and wantonness had had their effect upon it. The house is reached by a by-road branching off to the east from the Accrington and Whalley highway. The approach is under a picturesque gateway, having a wide semi-circular arch in the centre. This gateway opens into an outer courtyard, which leads to a second circular-arched gateway in the middle of a two-storeyed structure. The inner view of the gate-house presents a massive splayed circular arch, with a mullioned and transomed window above. The house itself, at the north end of the inner courtyard, has suffered demolition of the whole of its west wing, and now only shows a projecting east wing, gabled, and lighted with mullioned windows; a recessed centre, gabled, with three ranges of window lights; a pointed arched doorway in the westerly termination of the remaining wall, with remains of a mullioned and transomed window over it. This arch has evidently been the main central entrance of the quadrangular block of the mansion as formerly planned. In the interior of the portion of the house yet intact the parlour has its broad low-arched fireplace. A similar arch encloses the kitchen fireplace. In the rear wall of the house are two small window lights of evident age, with trefoil heads, and one with a head of rude tracery. These are evidently older than the other portions of the buildings, which were formerly moated and walled all round; portions of the moat trenches running north and south are even yet traceable in a field to the west of the buildings. There are sculptured panels and shields about the buildings, but these do not call for any notice.

Hoghton Tower has often figured in picture and story, and in its interior it is one of the most dignified and stately of all our East Lancashire mansions. It hardly comes under the description of Hall, but in structure it is to be ranked as a castle, though of the smaller class, and is domestic in its arrangements, without either the powers of defence or offence such as the Norman castles show. Very striking and picturesque is the interior of the great hall, with its splendid ceiling, wainscotted walls and minstrel gallery.

Another hall well worthy of careful study is the domestic-looking building known as Pleasington Old Hall. There is little wonder that it should have been deserted by the descendants of the ancient families who held it and converted into a farmhouse, for its site is most unpromising, as we regard those things in the modern view, being limited in area and in a deep hollow from which there is little of a prospect, and that not by any means of an inviting character. The building itself has many quaint features which are all its own, and apart from its architectural merits, which are considerable, it cannot be denied that it makes a very pleasing picture. Pleasington New Hall stands near by on more elevated ground, but it is quite a modern structure and has recently been purchased by Sir W. H. Hornby, Bart., the popular senior M.P. for the neighbouring borough of Blackburn.

Osbaldeston Hall, for a long time the seat of the Osbaldestons, dates from 1593, and is situated near the south bank of the Ribble, to the west of the old Roman fort of Ribchester. The Hall was formerly surrounded by a moat, the remains of which are still partly traceable. At the south approach a bridge crosses the moat, leading to a gateway shaded by sepulchral yews, probably as ancient as the Hall itself, of which but a mere fragment remains. The existing building is used as a farmhouse and comprises a block parallel with the river behind it with a central projection to the south constructed of brick with stone dressings; in the gable of this portion are large and handsome windows, mullioned and transomed. Above the upper window of the gable is inserted a coat of arms, the emblazonment on which is almost effaced. In the interior, says "The History of Blackburn," there is an interesting chamber in the upper storey of the building projecting to the south. This room is handsomely panelled in oak in geometric designs. The mantelpiece is antique and, with the chimney breast above it, about 12ft. high, is covered with elaborate scroll carving. Above the family arms, carved in wood, which are placed in a panel in the centre of the ornamentation, appear the initials "E. O." and "M. O." and again above these the initials "E. O." are

HACKING HALL.

MURAL PAINTING IN RELATION
TO ARCHITECTURE.*

By WILLIAM HOLE, R.S.A.

MUCH has been written of late years and many papers have been read and discussed with animation about the relations of sculpture to architecture, and there has never been a meeting of the Art Congress at which this subject has not come under consideration. This is as it ought to be, but at the same time it is matter for surprise that no voice has been raised (with the notable exception of that of Professor Baldwin Brown) on the closely-related subject of mural painting. He indeed has spoken earnestly—and spoken well. His words have been a seed which has already borne a little fruit, and I trust that his able advocacy may yet be productive of an abundant harvest of good works. Starting with the presumption that sculpture, as well as ornamental carving, is welcome accepted for the enrichment of the elder art of building, my proposition is that pictorial art—no less than what is known as decorative painting—should be turned to similar purpose in the service of architecture.

Michael Angelo declared that he himself knew of but *one art*; recognising (and who indeed has been more capable of forming a judgment) that the Trinity of the arts, though capable of existing as separate units, is incomplete save in co-operation, and that the supreme achievement of art consists alone in the union of architecture, sculpture and painting. To adapt with all reverence the words of St. Paul: "As the body is one and hath many members, and all the members of that body, being many, are one body; so also is art. Sculpture cannot say to architecture, 'I have no need of thee'; nor, again, can architecture say to sculpture or to painting, 'I have no need of you.' There should be no schism in the body, but that the members should have the same care one for another."

We all, I think, readily admit the force of these words, as well as of the principle involved, especially when we remember that this is fully illustrated by the examples which remain to us of the art of former days, before the severance of the members of its Trinity had been effected, before the palmy days of the self-sufficing cabinet picture or isolated statue, and when colourless architecture was unthought of.

The Rift.

The dawn of the early Italian Renaissance marks the period whence we may date at once

SILK HALL AT TOCKHOLES.

repeated. These initials represent either the names of Edward Osbaldeston and his wife Maud, who held the estates from 1575 to 1590, or of Sir Edward Osbaldeston, Knight, who died in 1636. The wife of Sir Edward was named Mary. Probably these carvings and panels were prepared in Sir Edward's time and under his direction. No other curious feature is left at Osbaldeston Hall. On the north side of the house most of the windows are blocked up, and the general aspect of the place is unsightly. Neglect and age have done their best to destroy the fair features of this once venerable pile.

In Hacking Hall and Livesey we come to buildings of a later date, one of which has come down to us, at any rate in regard to its exterior, as it originally left the mason's hands. Hacking differs from the other Halls I have described in the fact that it is three storeys high throughout and is built entirely of dressed stone. It is described as the "house of many gables," and the description is not inaccurate, for it has five of these projections in the front elevation and four on the back. It is beautifully situated on the south bank of the Ribble where that stream is joined by its two tributaries, the Hodder and the Calder. Its interior has been wholly gutted of its ancient woodwork, and its main features have been modernised in a rude and clumsy fashion. Our illustration will give the practical reader the best idea of its plan, the accommodation it affords, and of its striking southern elevation.

With this description I must close this account of these ancient Halls of the Ribbleside. Let the thoughtful reader draw his own inferences from the imperfect sketches. It will be well for him to note also that all these Halls are on the southern side of the Ribble, and that (not to use too bold a metaphor) they have been built almost within a stone's throw of each other. We look in vain on the northern bank of the river for a similar wealth of ancient buildings. You may walk the river bank on the south side and within a mile of each other come across Hacking, Dinckley, New Salesbury, Balderston and Osbaldeston, and a mile inland will give you Lovely Hall, Old Salesbury, Samlesbury (Old and New), Pleasington, Livesey and Hoghton. The Tockholes Halls are a little further afield and are remarkable from the fact of their isolation, and the elevation of their sites, which cannot be less than 1,000ft. above the level of the sea.

The whole series of the Halls are interesting to the architect from the fact that they convey the lesson that buildings of considerable dignity and picturesqueness may be achieved by the use of great simplicity of plan and detail. A proportion and balance of parts is the one thing necessary. In the exteriors of such structures as I have examined, there is little evidence of the sculptor's art, except in the moulding and in some of the stone panels which bear the owners' arms or other insignia. The windows are all of the simplest played stonework on a rigid plan and scale, with the superincumbent plain dripstone or hood. The

gable is an essential element of relief where the horizontal lines of the architecture are unbroken alike by finial or spirelet. But the most remarkable thing about the buildings I have had under review is, as has already been stated, the fact that they show how in the time of Queen Elizabeth, in this portion of Lancashire, wealth abounded and was put to good and profitable use. We are not, however, concerned in economic or historical questions, which may someday be answered, but which up to the present have not received the consideration to which they are entitled. It is of more importance to us to know that when a country is prosperous and peaceful art flourishes and architecture ministers to the comfort and convenience of domestic life in buildings that are both stately and monumental.

A new Primitive Methodist Chapel at Mattishall, Dereham, is being built. Mr. Kerridge, of Messrs. Kerridge and Son, Wisbech, is the architect, and Mr. King, of Mattishall, is the builder.

An American Idol.—Forty thousand golden sovereigns is the amount of gold which has recently been put out of circulation by being cast into a statue of "The American Girl," which is to be the gold exhibit of the State of Colorado at the Paris Exhibition. The statue stands 5ft. 5in. in height, containing about 712lbs. of pure gold. The cost of making the statue and casting it is about £12,000, and it is the work of a woman, Miss Bessy Potter.

FIREPLACE IN SILK HALL, TOCKHOLES.

the increased vitality of each member of the body of art, and also that little rift between them which heralded their ultimate severance from, and independence of, each other. Knowledge was increased, and with it the pride of individual achievement, without the counterbalancing and restraining influence of wisdom to maintain the ancient bond of union so valuable to all alike. Until that time both sculpture and painting had been completely subordinated to the purpose of architecture, while at the same time buildings were conceived and planned with due consideration of the part to be played by the younger arts in the completed work, and there was recognition of their value in its service. We have but to cast our eyes upon the examples which still survive of Byzantine and Romanesque architecture to see that this is so; and while it is beyond dispute that since these early days architecture, sculpture and painting have recovered much of the lost glories of the Antium, that they have invented new methods, and made vast strides towards individual perfection, it is no less obvious that there is to be found in these ancient monuments, in spite of manifold imperfection of detail, a restful and satisfying sense of the harmony and completeness of the work as a whole, unattainable by the contemplation of any specialised production (no matter how supreme its accomplishment) which relies for its effect upon its own unaided merit.

Those who have been privileged to visit the basilicas of Rome, the cathedral of St. Mark, and the churches of Ravenna and Palermo, must, I think, acknowledge the truth of this. If we study the glories of these magnificent interiors, scintillating from floor to ceiling with waves of modulated, harmonious and subtle tint in marble and mosaic, and have noted how this wealth of colour is duly subordinated to the service of construction, we cannot but groan in spirit at the thought of our own grudging and niggardly decorations, and the lamentable contrast displayed by the bald and colourless, or discoloured, walls of our modern and British churches and public buildings. Gentlemen, we are enlisted in the service of Art, eager and anxious to further her advance, and if a sense of inferiority in respect of colour has ever taken hold of us, if we have experienced a longing to advance beyond the artificial limits hitherto imposed upon us by modern custom and recent tradition, let us not rest content with tacit acknowledgment of our need, but strive by co-operation of the arts to recover our lost inheritance and utilise for the common weal knowledge acquired in the several spheres during centuries of civilisation, recognising that in this direction lies our opportunity to break fresh ground, and that as pioneers we shall have that stimulus of novelty in our work which quickens vitality in art and indicates its advance. There is a wide field to be cultivated, open to the display of our energies, for by the term "public buildings" I mean not only churches and town halls but libraries, hotels, banks, hospitals, and music rooms—in short wherever people meet and act in common.

Difficulties which hinder Progress.

I am well aware of the difficulties which lie in the path of a new departure; but these are not insurmountable, as is evidenced by the partial success which has attended such tentative efforts as have already been made. In the first place we have to recognise the fact that art is not popular; we must ascertain the cause and find the remedy. Secondly, there is the very practical question of expense; and, thirdly, that of the lack which at present undoubtedly exists of necessary training on the part of artists themselves. To face and overcome the indifference and the apathetic attitude of the public towards art is no easy task. Wealth in combination with taste, generosity, and public spirit such as has been displayed in recent years by three distinguished citizens of Edinburgh is not common at all, and these brilliant exceptions to the prevailing spirit serve but to emphasise the apparent indifference of the community at large. Artists have still to rely upon individuals rather than upon communities for encouragement in their craft; but for the combined opportunity which we

now desire we have the public to look to and the public to persuade. For, whether in the form of government, vestries, municipalities, companies, or committees, the public is sooner or later the paymaster. The public, therefore, must be shown that beauty is useful, and that in the end money wisely expended on the embellishment of a building returns an excellent interest.

How strangely are we creatures of custom! We do not miss the faculties we have never possessed, and are content with imperfections to which we are born. What does the deaf man know of the delight of music, or he that was born blind of the glories of the sun? They are content, knowing no better. How else shall we account for the obvious fact that the average Briton, unaccustomed for centuries to associate the idea of colour with construction, when he steps beyond the limits of his own mansion, should feel no resentment at its omission, nor feel that anything is lacking. He apparently shares the sentiment of the lady who, on the suggestion that the church walls would be the better for a coat of white-wash, replied that she preferred the kirk "as God made it!" And yet I cannot believe that the faculty is wholly wanting. We certainly possess a sense of colour, and indulge it by the use of decoration in our private dwelling-rooms. There we would not tolerate for a day the barrack-room bareness or spiritless painting that distinguish the walls of places which we dedicate to the service of God and to the use of the community. Many of our homes are beautiful; thought, taste and skill have been expended on their decoration; furniture, painting and textiles contributing their quota to the sum total of rich, restful colour, and harmony of tone. And who can say how much we are indebted to these influences for comfort and for mental and bodily health in an age of strain, hurry and nerve-tension. Negation of colour in our surroundings would act on our nerves as if we lived in a world devoid of sound; strident, incongruous colour is irritating as perpetual discord and family jars; while a room furnished and adorned with taste is soothing and refreshing to the vexed spirit as a strain of music. We decorate our houses for our own personal comfort and pleasure. Is it too much to demand that as much should be done for the public benefit in buildings built for the public, and also to make the House of God more worthy of our offering and of His acceptance? We cannot measure the influence of beauty. We enlist music in the service of God, our churches are designed nobly and well, and shall we not use such influence as we possess that still more be done; that ordered and harmonious colour shall be added to graceful structure, and by computing the round of artistic unity not only make, as I said, an offering of the best we can do, but attract and retain to God's worship many who come, perhaps, merely to admire, but remain to pray?

Mr. Sedding's Opinion on "Things Amiss."

The late Mr. Sedding, the well-known architect, in an able paper upon "Things Amiss with our Arts and Industries," laid the burden of blame unsparingly upon the shoulders of artists themselves when he said: "Had you found the service of Vanity Fair less pleasant and lucrative—had you not succeeded so well in exhibition work as to observe your ideals—had you not exiled yourself from the service of religion, there had been another tale to tell. The pity is

In this world, who can do a thing will not,
And who would do it, cannot, I perceive.

And why are painting and sculpture so deficient in popular appeal, but for these two reasons? They are arts cultivated exclusively for the rich and they are not decorative! In both of these particulars they stand condemned by the art of all lands and all times. It isn't genius, it isn't skill or invention, that is wanted to fit them for popularity; it isn't even that the times are against the production of decorative design; it isn't that there are not hundreds of new churches to decorate, whose interiors are now as interesting as the walls of a coffin. It is that the arts require a new

direction; it is that the artist is too much engrossed with his own individual sphere of work to care to distribute art to the people by applying it to industry or to adorn places that are easily accessible to the people. No art can be popular which is not decorative. If the fine arts were more decorative they would be more popular, and if our painters, sculptors, and architects desire to make art more popular, love will track the way. One great hindrance to our progress is that selfish isolation of the arts which is at once the characteristic and the curse of modern British art life. We mourn over the unpopularity of art; we say, and say truly, that with half our technical power and imaginative range the art of old days had twice our power of appeal, twice the hold upon the attention and the affection of men. Yet, if the greater arts will minister to the lesser, if the master will be as he that serves, then the federation of the arts, which is so much needed, will follow upon this action as a natural consequence."

We now have to face the second difficulty, namely, that of money. We will leave out of sight for the present the question of the employment of mosaic, on account of its costliness, and still more, because in my opinion it is unsuited for the decoration of buildings constructed of stone, the material with which architects in this country have usually to deal. Mosaic can only be suitably employed, I think, in conjunction with polished and coloured marbles, alabaster and similar substances, as in the case of the examples already cited. We will be more modest in our requirements and remember for our encouragement that the vast proportion of works by great masters of the art of decoration, to which we turn for instruction in method, and as a basis from which to make our own excursions, have been executed in

Fresco,

or in its modern substitute, known as *spirit fresco*. This material combines the positive advantages of cheapness, durability, facility, rapidity of execution, and power of resistance to the damp and impure atmosphere of our northern cities—a quality which, as you are aware from the failures which have invariably attended attempts to use it in this country, is not shared by Italian or true fresco. A painter who has mastered the use of fresco and is conscious of the limitations imposed by it, and by the special requirements of pictorial art considered as decoration, is enabled to express his idea in this medium rapidly and easily, and can consequently afford to cover a larger surface for a remuneration which bears no comparison with that which he would justifiably claim for work of the easel-picture standard of size and finish of detail. Prices vary, of course, according to the accomplishment and reputation of the artist employed, but I have little hesitation in saying that an addition of 5 or 6 per cent., or the easy transition from pounds to guineas, on the estimated cost of a public building, to be devoted to its pictorial decoration, would go far to add to its attractiveness and beauty.

And upon the extremely delicate subject of remuneration, I think I may venture to say at least this much to all concerned. Let us not stand too rigidly upon the unstable pedestals of dignity, nor decline an opportunity of doing yeoman service to the people merely because it doesn't happen to pay well. It *will* pay in the end. A man who really loves his work for its own sake finds in the exercise of the talent entrusted to him, in the chance of doing service, a pleasure and reward that cannot be reckoned in terms of cash. Of course, to use a colloquial phrase, a man must earn his bread and butter. Quite so, but there is no necessity that it should also be spread with jam. The labourer is certainly worthy of his hire; but the labourer who trusted his master and obeyed his bidding without further question, knowing that he would be fairly treated, received in the end a wage equal to that of the cautious individual who was too shrewd to set to work before he had made a hard and fast bargain with his employer for his penny a day.

I now come to the consideration of the third difficulty, the lack that at present exists of

necessary training on the part of the artist; for if the results of the past are to be emulated the means which led to such results must also be taken. At present architects, sculptors and painters, as a rule, know little and, I fear, care little about any branch of art that lies beyond the limits of their own. The sculptor generally depends upon the architect to supply a pedestal for his statue. The architect in turn has but the most rudimentary or erroneous knowledge of colour; while it is rare to find a painter capable of regarding a mural space otherwise than as an opportunity for painting a picture in his customary style but on a larger scale, and without the formality of a frame. In former days an artist was a man thoroughly grounded and educated in all branches of art. He was competent to design a building, to decorate it with architectural sculpture, and adorn its walls with decoration painting; but in these times the knowledge required was limited to that of the style which prevailed at a particular period and in that particular country. Such is not the case nowadays. We have no definite style which prevails to the exclusion of all others; but buildings are designed, well or ill as the case may be, according to the taste and fancy of the client, and of every conceivable style and period, from that of the Parthenon to a Queen Anne mansion. Life itself seems too short for the architect of the present day to fully equip and familiarise himself with the practical knowledge of styles required, in order to meet the varied demands made upon his skill and experience. His department of art is, therefore, by the nature of things, specialised; and all that can reasonably be claimed from him in addition is that he should study colour in relation to construction, so that he may be enabled to make its introduction an inherent part of his architectural idea and design. As evidence that this method was followed out in the past, I may instance the case of the well-known Triforium—but in the Church of St. Apollinare at Ravenna, where the stately, white-robed figures of the processional mosaic form a constructive decoration, taking the place of pilasters or other device of decorative construction, which would otherwise have been architecturally necessary. It must be obvious, therefore, that when coloured design is merely added to architecture as an afterthought, instead of forming one of its inherent parts, it runs the risk of failure and of falling into the condemnation of intrusive ornament, concealing a bad building or spoiling a good one.

The painter has also much to learn before he is qualified to contribute his share of the work. It is not enough that he should be let loose, however skilful he may be in his own profession, to work his will in a hitherto uncultivated field. He should be conversant with the general principles of architectural design, so that if left to his own devices he may read the intention and idea of the architect, and bearing this in mind adapt his work to the exigencies of the case. To attempt decoration without this previous knowledge is, as it were, to try to illustrate a book written in an unknown tongue.

Advice to Students.

I therefore counsel all art students, no matter what their ultimate ambitions may be, to study simultaneously during their period of pupilage, architecture, painting and sculpture, and to specialise afterwards. At school they were taught at the same time reading, writing and arithmetic. A medical student studies both anatomy and medicine, whether he intends finally to become a surgeon or a physician; and in art the same principle of education must be applied and enforced if better and broader results are to be obtained than are possible under the present system. A longer period of apprenticeship will certainly be necessary, but what of that? It is surely better to spend time wisely and well at the outset of a career than to find it wasted in the end, and on the road to commit costly errors, palpable, enduring and irremediable.

In the concluding part of my remarks I shall try to indicate the special characteristics of mural painting, its principles of construction, its

limitations and its powers, so that in forming judgment we may the more readily distinguish right from wrong, withhold approbation from work (attractive it may be to uneducated perception but wrong in principle), and appreciate the merit of work which fulfils its first requirement, though lacking in less essential qualities.

It is most necessary in this, as in other matters, to establish firmly a correct standard of taste, for the confidently expressed opinion of critics and amateurs, the influence which it exercises over that of the public at large, has much to do with the advancement or discouragement of true art; while the reasons which can be urged as a basis for these opinions can commonly be reduced to nothing more definite than the words "I like."

To quote the words of the French critic, St. Beuve: "The first consideration is, not whether we are pleased with a work of art, nor is it whether we are touched by it—what we seek above all to learn is whether we are right in being pleased with it, and being moved by it, and in applauding it."

Judgment of Mural Decorations.

To begin with, we must not base our judgment of a mural decoration on the knowledge we may happen to possess of the essential qualities of the cabinet or easel picture, the characteristic production of a realistic age. Both alike are, or ought to be, a record of the artist's impression of fact, beautifully arranged and beautifully expressed; but the easel picture is a thing *per se*, whole and self-sufficing. It bears no relation whatever to anything else, not even to the frame, which is its architectural servant, contrived simply and solely to confine attention to the beauties of the picture itself, and to ward off the effect upon it of any other object in the neighbourhood.

A mural painting, on the other hand, is not an independent and isolated work of art like a cabinet picture, but part and parcel of an architectural scheme. It starts from an architectural basis, and its merits or demerits as decoration must be judged entirely with reference to its environment. To give an exact definition, I am indebted to the words of the American critic, Royal Cortissoz, who states that "Mural painting is that permanent addition of painted colour to a wall or other immovable portion of a building which falls into the effect of the whole structure as the lines of an arch fall into it on the purely architectural side of the design. Lay hold on that fundamental conception, and you have a touchstone for all the decoration ever painted. No matter what the form may be, pictured design or solid tint, the decoration must be an integral part of the architectural whole. And to be this, it must be brought into conformity with the general character of its surroundings. Now, this seems obvious enough; but ignorance of it, or indifference to it, has done more to disfigure noble buildings and retard the growth of a noble art than all the incompetency that ever expressed its dreary self through the medium of colour."

How Mural Decorations should be treated.

In accordance with the principle thus ably and clearly enunciated, illusion must not be attempted, neither should the facts of nature or various planes of distance be expressed, as naturalistic treatment would suggest, by modelling of form or by relative values of colour; in other words, by detachment of objects from their surroundings and gradations of colour force. To do this would be to deny or contradict the inherent structural flatness of the wall to be decorated. A landscape or an interior subject thus treated would at once, so to speak, open a window in the wall or suggest the existence of an adjoining apartment. The canvases of Tintoret and Veronese, designed to decorate the walls and ceilings of the ducal palace at Venice, are a notable instance of such erroneous method. They are masterpieces of painting, they are superb pictures, but false decoration. In mural painting comparatively conventional flatness of treatment must take the place of realistic modelling of form; linear rather than

aerial perspective is relied upon to suggest distance; and the separation of objects is effected by difference of local colour; while light and shade if not wholly wanting is merely indicated. Such is the method of Giotto, such is also the method of Puvis de Chavannes, masters of the art of decoration, who join hands in principle across the void of time which separates their practice.

While certain obligations and limitations are thus imposed upon the decorative painter from which his brethren are exempt, in all essential matters he enjoys a freedom which equals, nay, surpasses, theirs. His ideas have no limitation beyond that of his own originality and power of resource. The current of his thought is unhindered by the elaboration of inconsequent matter, and the rapidity of execution demanded by his material implies and necessitates a corresponding simplicity of technique.

Let no one be offended with the word "conventional," nor imagine for a moment that there is any inferiority on this account between a picture thus treated and a work of the most exhaustive realism. All art is conventional, and every artist adopts a certain convention wherewith to express his ideas. Art may be defined indeed as the conventional representation by means of ordered words, colour, sound, light and shade, or line, of ideas suggested by the facts of nature; and greatness in art consists in the nobility or beauty of the idea, coupled with skill in the selection of suitable material, and in the use of the convention adopted for its expression. Such a definition covers, I think, the whole realm of art, whether of music, literature, architecture, or the graphic and plastic arts. None of these is, *per se*, greater or less than another, none aims at the imitation of natural fact, while all alike depend for their effect, in varying degree, upon the imagination of those to whom they appeal.

So much is convention in art as in daily life a matter of habit, that we forget its very existence unless it appears in a new and unaccustomed form. Take the familiar instances of a pen drawing or of an etching, where strokes stand for shadows; where a circular line on the blank paper with, perhaps, a radiating scratch or two, is the readily accepted representation of the sun; and where colour is left wholly to the imagination. Yet for all that the whole thing, colourless and extremely conventional as it is, suggests the artist's idea and the existence of omitted facts quite as well as, and often rather better than, the most exhaustive treatment of a realistic picture.

Moreover, the conventionality, so to speak, of the particular convention now under consideration is less than would appear at first sight. I have already noticed a similarity between the works of Giotto and those of Chavannes, who represents the latest and best development of mural painting. The breadth and simplicity of the works of the former are doubtless owing to the fact that Giotto lived before that knowledge had been developed which subsequently enabled art to follow so closely on the heels of nature; and yet that very knowledge, acquired by the modern practice of study in the field and observation of the subtlest aspects of nature, has revealed the shadeless effect of diffused light, so that the work of Puvis de Chavannes, the nineteenth century master, who neglects nothing, yet has learned to omit much, bears a strange resemblance to the simplicity of a primitive fresco.

I must not at present enter, however, upon the discussion of details of this sort, but content myself with the statement of broad general principles. It is sufficient if, by reminding you of these, I have been able in any degree to arouse dormant interest in mural art, and to urge the claims which it makes upon your consideration for reinstatement in its former position as painting for the people.

I have heard it stated that the noble art of painting is degraded by being thus forced into service, and subordinated to any requirement other than its own. Such is not my opinion, nor will it be held, as I venture to believe, by anyone who has grasped the idea of the dignity of service. On the contrary, for this very

reason, if for no other, mural painting claims to take rank with the highest art. To earn the title "A Great Decorator" should be a painter's noblest ambition and his greatest claim to the respect of his own and succeeding generations.

"BUILDERS' JOURNAL" SHILLING FUND.

WE give below a further list of subscriptions received for our Shilling Fund for assisting in the erection of Homes of Rest for Discharged Soldiers. It is still the case that the majority of the lists sent in are made up of a number of small gifts collected by some energetic reader of the BUILDERS' JOURNAL from his employes or fellow workmen. This seems to suggest that there may yet be a great many would-be subscribers to our fund who are only waiting to be asked for their shilling. They will not, perhaps, take the trouble to send off a postal order on their own account, but let a friend or acquaintance present himself before them with a BUILDERS' JOURNAL collecting form in one hand and a lead pencil in the other, and the shillings will promptly be transferred to the Soldiers' Homes account. If more of our readers were willing to devote a little personal effort to the good cause, we feel sure the total receipts would be quickly and substantially increased. Here for instance is a letter received last week from a clerk of works at Birmingham, which shows the enthusiastic spirit in which some of our friends have responded to our appeal, and suggests what might be done if more helpers would come forward:—

"DEAR SIR,—I am sending herewith the first instalment of contributions, 27s., collected for the Homes of Rest, and I am hoping to forward another shortly. If ever there was an object for which I could be enthusiastic, it is the Homes, and the same enthusiasm prevails among the foreman and workmen whom I have asked for help. I have not yet met with a single refusal, and I believe could this district be thoroughly worked a large sum might be raised.—F. W. ANDERSON."

We will gladly forward collecting forms to any who will make good use of them, and as a slight acknowledgment of the efforts of our collectors we shall continue to send a copy of the last published issue of "Specification" to all who send 20s. and upwards to the fund.

The following subscriptions have been received since the publication of our last list:—

The building trades in Birmingham are making an organised effort in support of the Building Trades' Gift. At a meeting of representatives of employers and employed held on April 9th, the following resolutions were carried unanimously:—Proposed by Mr. J. Matthews, seconded by Mr. Vaughan: "That the representatives here present recommend to their several societies that they contribute to the Building Trades' Gift, and that the contributions should be at the rate of not less than 1s. 6d. per member from the tradesmen, and 1s. from labourers." Proposed by Mr. F. G. Whittall, seconded by Mr. S. Lakin: "That the collection of the fund for the Gift be left in the hands of the various societies, and that the amounts be collected during the month of May, 1900." Mr. F. G. Whittall (President, Birmingham Builders' Association) was unanimously elected president; Mr. Wm. Sapcote (President, National Association Master Builders), treasurer; and Mr. Ernest J. Bigwood, hon. secretary of the Building Trades' Gift in Birmingham.

The following subscriptions and contributions have been received by the executive of the Building Trades' Gift to the Nation:—

FOR INDIVIDUAL SECTIONS OF THE WORK.
The Patent Tile Works (Bridgwater).—1,000 Red Double Roman roofing tiles, with the necessary ridge tiles.
The Mosaic Manufacturing Co.—80 yards wool block flooring.
The Limmer Asphalt Paving Co.—200 yards super. asphalt for footways.
Mr. Charles W. Matthews.—The whole of the stone-work for one Home.
Messrs. Wiggins and Co.—Ridge tiles and flials for four Homes.
Mr. James Cann.—One ton of Whiting.
Mr. Thomas Crompton (Ashton, near Wigan).—Ironmongery to the value of £10.
Messrs. Minton and Co. (Stoke-on-Trent).—100 yards fancy tessellated tiles.

The new Orange Hall at Larnie will be 70ft. by 35ft., and the portion facing Curran Road will be two storeys high.

The Columns of Karnak.—While setting up a fallen column of the temple of Karnak, M. Legrani came upon a city gate, the first that has been found in Egypt. The gateway is of very great height, is made of large blocks of squared limestone, and is double, having one gate within another. Two chariots could easily have passed through it abreast. It was erected by Amenhotip the Second, of the eighteenth dynasty.

DENNINGTON CHURCH, LOOKING SOUTH-EAST.

DENNINGTON CHURCH, SUFFOLK.

By RAYMOND C. WRINCH.

DENNINGTON is a picturesque village about three miles from Framlingham, Suffolk. The church is dedicated to St. Mary, and, as will be seen by the accompanying plan, consists of chancel, nave, north and south aisles, two chapels, tower, vestry and porch. It is a very large church for so small a village, the total interior length being 149ft. 6in. and width 47ft. The chancel is 49ft. 4in. long, and the height from the nave floor to the top soffit of the chancel arch is 29ft., to the top of the tower parapet 75ft., and to the summit of the beacon tower 82ft. The tower is of great strength, the walls being 5ft. thick. The screens which divide the two chapels from the rest of the buildings are of oak, but, unfortunately, have been painted in an atrocious manner by (I am told) the daughters of one of the late rectors.

The two bays of the screen to St. Margaret's Chapel, shown on one of the inset sheets this week are those marked on the sketch plan on this page. This chapel contains the tomb of Lord and Lady Bardolf, which is a remarkably fine piece of work in alabaster; but it is to be greatly regretted that so many persons have cut their initials all over the figures. Lord Bardolf fought in the battle of Agincourt, October 25th, 1415. His effigy is on the left, his lady taking the place of honour, as he was Lord Bardolf in her right.

Dennington Church in the fourteenth century consisted of the present decorated chancel; the corbels under the chancel arch are, however, remarkable, as they evidently belong to an earlier period than the rest of the chancel carving. The chancel contains on the south side two piscinas, a sedilia, and a priest's window-seat adjoining the sedilia.

The capitals of the chancel windows are varied and beautiful examples of their kind. There were originally two priests' chambers, one above the other, which are now used as vestry and lumber rooms. These were made extremely strong, the windows being fastened by bars of iron and guarded by massive shutters which could be securely fastened on

from the inside. The trap-door over the steps, which were constructed of triangular blocks of oak, was locked from below. The door is also very massive. The nave, clerestory, aisles, porch, vestry and tower are of the Perpendicular period, while the porch is on the north side, which is unusual. The church contains some beautifully-carved benches with tracery and poppy heads, &c., which are all of different treatment with the exception of two. It also contains a sand table on which the children of the old days were taught to write. This consists of a long narrow table with a raised edge all round to keep the sand in, and an instrument like the plasterer's trowel made of wood with which to smooth the sand. The writing was made on the sand with one's finger or by means of a piece of stick. There are also some very fine old chests. The pulpit is a poor specimen of Jacobean work and looks very out of place with the beautiful screens and benches. The western embattled tower con-

DENNINGTON CHURCH, SUFFOLK: SKETCH PLAN.

tains a fine peal of five bells. The walls are of rubble, faced externally with flint and inside with plaster. The register dates from the year 1559.

A new Fountain in Richmond Park has been erected for public use by Mr. Skewes-Cox, M.P. It is of red granite, and is situated near the Kingston entrance of the park. During the coming summer months it will meet a long-felt want.

Vicar as Architect.—The Rev. E. V. Stephens has acted as architect for the new chapel now being completed at Camelford Station. The building of edifices by the clergy is a growing passion—perhaps we are reverting to the old!

Under Discussion.

Vanishing London: The Blue Coat School.

At a recent meeting of the Farringdon Ward Club Mr. Archibald Dick, the honorary correspondent of the British Archaeological Society, read a paper on "Vanishing London." For initial treatment he appropriately chose Christ's Hospital, dealing with the subject in a very lucid and comprehensive manner. While regretting the pending removal of the school, he expressed a hope that members of the club would endeavour to visit the institution before its transference to Horsham. The north-east corner of the school had, he said, a good many interesting associations. Being situated near the river the earliest inhabitants naturally took up their abode in the vicinity, and this particular corner was occupied by the

meat market, one of the thoroughfares gaining the name of Stinking Lane, on account of the offal deposited there. At the time of the Franciscan movement there were two classes of monks in practice—the Dominicans, or preaching monks; and the monks of Grey Friars, whose doctrine was physical, rather than religious. The latter were received with acclamation, and had their first settlement in Cornhill. In the following year John Ewen presented them with a piece of land in Newgate, and the mayors provided a church, cloister, dormitory, and other buildings essential for a priory. Thus the school was established. Eighty years later the movement had so far progressed that Royal patronage was accorded, and the church now known as Christ Church, Newgate Street—one of the most beautiful which graced the City—was built. The preservation of the buildings, said the speaker, as a place of education was a magnificent example of what might have been done throughout the country, and he thought that to-day we suffered very much from the fact that many of these old structures were not retained for educational purposes. These magnificent buildings existed down to the time of the Great Fire, but they suffered considerably from the conflagration, and now almost nothing was left of the original school. The great hall was built in 1680 at a cost of £25,000, and at a later date the south front, which was a most beautiful example of brickwork, was rebuilt. The writing school was erected by Sir John Moore in 1694. In the court, called the garden playground, some fine arches were also to be seen. The other buildings were rebuilt in 1834. There was in the establishment a pulpit of ancient origin removed from one of the city churches, with some stained glass believed to have been rescued from the Great Fire. All those features, Mr. Dick presumed, would be placed in the new school at Horsham. In conclusion, he moved the following resolution:—"That, in the opinion of the Farringdon Ward Club, the loss of Sir Robert Clayton's building and the remains of the Greyfriars' Priory would be most regrettable, and therefore it would be desirable that an effort should be made to secure the preservation of the buildings in the event of the demolition of Christ's Hospital."—Mr. D. J.

BENCHES, DENNINGTON CHURCH, SUFFOLK.

Rees seconded, and the resolution was adopted unanimously.—Mr. Dick, in reply to a vote of thanks, suggested that whoever might buy the site of the school should allow the portions of the building above mentioned to stand in the same way as the Prudential Company permitted the old building to remain on Holborn Viaduct.

Liverpool and the Housing Problem.

"The Housing Problem: What it Involves, and How alone it can be Settled," was the title of a paper recently read before the Liverpool branch of the Society for the Taxation of Land Values by Mr. T. Burke, C.C. In the course of the lecture he remarked that in no city in the United Kingdom had the housing problem been treated in so trifling a fashion, and in no other was slumdom so supreme and its concomitant evils so rampant as in Liverpool. As to the question that might be asked, why people did not go further out from the heart of the city, Mr. Burke said that the overwhelming majority of those who lived in the areas referred to could not live any great distance from the docks, and the recent craze of transporting them to the outer areas was a sheer impossibility. The development of the city, the expenditure of public money on electric traction, the extension of the city boundaries, had so increased the value of land in St. Michaels, rural Texteth, and other districts during the past years that the builders could not possibly erect houses at the rents which the working-classes could afford to pay. From the very outset the Insanitary Property Committee had been faced with the difficulty of getting land, and how, then, were the 8,000 or 9,000 houses of an insanitary character to be swept away and proper provision made? It was abundantly clear that a tremendous burden must be laid upon the shoulders of the ratepayers if the requisite steps were to be taken under the existing laws, and they thus found themselves driven to the enquiry, "Where is the money to come from?" He answered in the words of Mr. Joseph Chamberlain, in his valuable evidence before the Royal Commission, that as "the ground landlord is benefited immensely by the general improvement to the place to which the improvement contributes, I do not see why he should escape scot free." Mr. Burke gave instances of the high prices demanded for land from which the slum property had been erased to show that the land monopoly was the cause of overcrowding, and it followed, therefore, that until the monopoly was broken in twain the problem of rehousing the toilers might be relegated to "the man in the moon." In conclusion he said, "Bring pressure on our public men to demand in their various councils the taxation of those ground values which are the creation of the community, and the problem of the housing of the people will settle itself automatically, without the setting in motion of Acts of Parliament which squander enormous sums of money on lawyers and landlords; and the earth will no more have to witness that sad blot on its fair face which is an insult to its Creator."

Students' Design Competitions.

At a meeting of the Edinburgh Architectural Society, held on April 11th, an address was given by the honorary president, Mr. R. S. Lorimer, A.R.I.B.A., and the prizes gained in the session's design competitions were presented. Mr. Lorimer, in his address, made some remarks upon students' design competitions. All were convinced, he said, that there was no better way for architectural students to supplement their office work than by these competitions. The subjects chosen for competition should not be too dull or commonplace, nor should they be too much "in the clouds." The object should be the ideal treatment of a really practical subject. In referring to the Street Front Competition, Mr. Lorimer thought that an elevation of this sort should be as smooth and simple as possible up to the height that people passing could reach, and should be of a good stone, granite by preference, having all the corners rounded. Too little was known about the proper uses of the different building

materials. The material should suggest the treatment. Stone orders should not be repeated in cast iron. All ornament was useless if it did not give pleasure, and many modern buildings were overcrowded with meaningless ornament. Mr. Lorimer referred to and criticised several buildings lately erected in Edinburgh to illustrate his remarks. The honorary president then presented the prizes as follows: Honorary president's prize of £10 for three designs—(a) Pulpit for a seventeenth century city church, (b) street front, and (c) chancel screen for a modern Gothic church—gained by Mr. Bailey S. Murphy, who had two firsts and one second. President's prize of three guineas for a design for a public school to accommodate 600 pupils—gained by Mr. W. S. A. Gordon; a second prize for this design was presented by Mr. Robert Wilson, and was won by Mr. W. H. Johnson. Vice-president's prize of two guineas for a design for an electric light lamp-post—gained by Mr. Andrew Muir.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Law About Professional Titles.

CARDIFF.—OLD READER writes: "Is there any law which forbids a man who has been laying house drains, &c., and has been connected with building in all its branches for a period of more than twenty years, but who has not passed any examination, to advertise himself for trade purposes as a 'sanitary engineer' or a 'sanitary expert'? If contrary to the law, what would be the course to adopt and would a South Kensington 'Advanced' Building Construction certificate cover the case?"

There is not any such law.

Architects and Sunday Work.

HALIFAX.—FAIRATION writes: "When work is necessitated that was not contemplated, such as foundation work requiring water in a dam to be drawn off at week ends, which needs day and night labour and the attendance of a clerk of works and the architect, can the architect charge for these additional services from Saturday afternoon to Monday breakfast time? A legal adviser informs me it is one thing to pay the clerk of works (as has been done by my clients) and another to remunerate the architect who is working by ordinary commission. It does not seem right to the latter, who never anticipated such work and has thus had to negotiate the terms and the drawing off of the water numerous times in carrying out the foundations by piecemeal, which consequently entailed extra meetings, correspondence and interviews."

The architect's commission includes the extra work done on Sundays. H. P. B.

Colouring for Stucco.

MANSFIELD.—VEXATUS writes: "Can you inform me of a reliable yellow colouring for stucco (composed of equal parts of lime and sand)? I have tried vegetable colourings, and find they do not stand."

Without knowing the class and nature of the lime used, or to be used, it is somewhat difficult to say with certainty which is the best colouring matter. Each variety of lime has its own individual nature and perversity. Saline matter and other impurities in the sand have also a disastrous effect on vegetable pigments. Lime newly slaked or used in a warm state is the principal cause of subsequent defect in the colour. Lime that has matured by age and thorough working may be used for vegetable pigments, especially if the colouring

matter is thoroughly incorporated by mixing twice or thrice, allowing the mass to stand two or three days in the air between each mixing. A good and permanent yellow colouring matter is obtained with citrate of iron dissolved in oxy-sulphate of iron, sulphate of cadmium, chromate of lithium, and yellow of antimony. Yellow oxide as used for colouring fine concrete is a good medium for colouring stucco work. Consult an intelligent local plasterer, such as Messrs. Wilson and Son in your district, as to the class and nature of the lime and sand that you propose to use; also have a few sample pots made to test the colour of the work when dry. W. MILLAR.

Correspondence.

Cost of Workhouses.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—Having seen on page 173 of your issue for April 11th the enquiry by a student of the cost per cube of workhouses, and Professor Adams' reply, I must say I consider the reply very misleading, as I have found from personal experience, which is of no small extent, that a workhouse at the present time cannot be built for £50 or £60 per inmate in London. A workhouse building should not be cubed at less than 10d. per foot cube for the pavilions, and at 1s. for the administration buildings (in the provinces it may be taken a little lower), and this is exclusive of lighting and heating. The pavilions are cubed at a lower rate on account of there being so much open space. For instance, at the present time a workhouse in London costs about £200 per inmate, but in the provinces the same building could be built for £120 to £150 per inmate.—Yours faithfully, A. C. F.

Building Stones around Liverpool.

To the Editor of THE BUILDERS' JOURNAL.

WANDSWORTH, S.W.

SIR,—Referring to the article which appeared in your last issue on the above subject, I should like to correct a statement by Mr. A. W. Street, with regard to limestones. He says, "Portland stone is one of the finest limestones to be obtained for general building purposes; that is, if you happen to obtain the white-bed and not the basebed, for the weathering qualities of the latter are greatly inferior. Basebed is fit only for internal work, and great disappointment is caused when it is used, mistaking it for whitebed, in external work exposed to trying atmospheres." Now at the outset I may say for the benefit of your readers that white bed and base bed are undoubtedly known in the trade as one and the same. *Whit* bed is probably what Mr. Street intended to say. *White* and *whit* makes all the difference. It is not in my opinion sufficient for an architect to simply say *Portland stone*, but should specify *best whit-bed Portland stone*. And on a work of magnitude, to ensure this being carried out, I would advise that the whole of the stone should be selected and approved by a practical mason, who would understand its peculiarities. Certainly I would not leave such an important matter in the hands of a clerk of works who was by trade a carpenter, but would endeavour to obtain a clerk of works who was a proved practical mason.

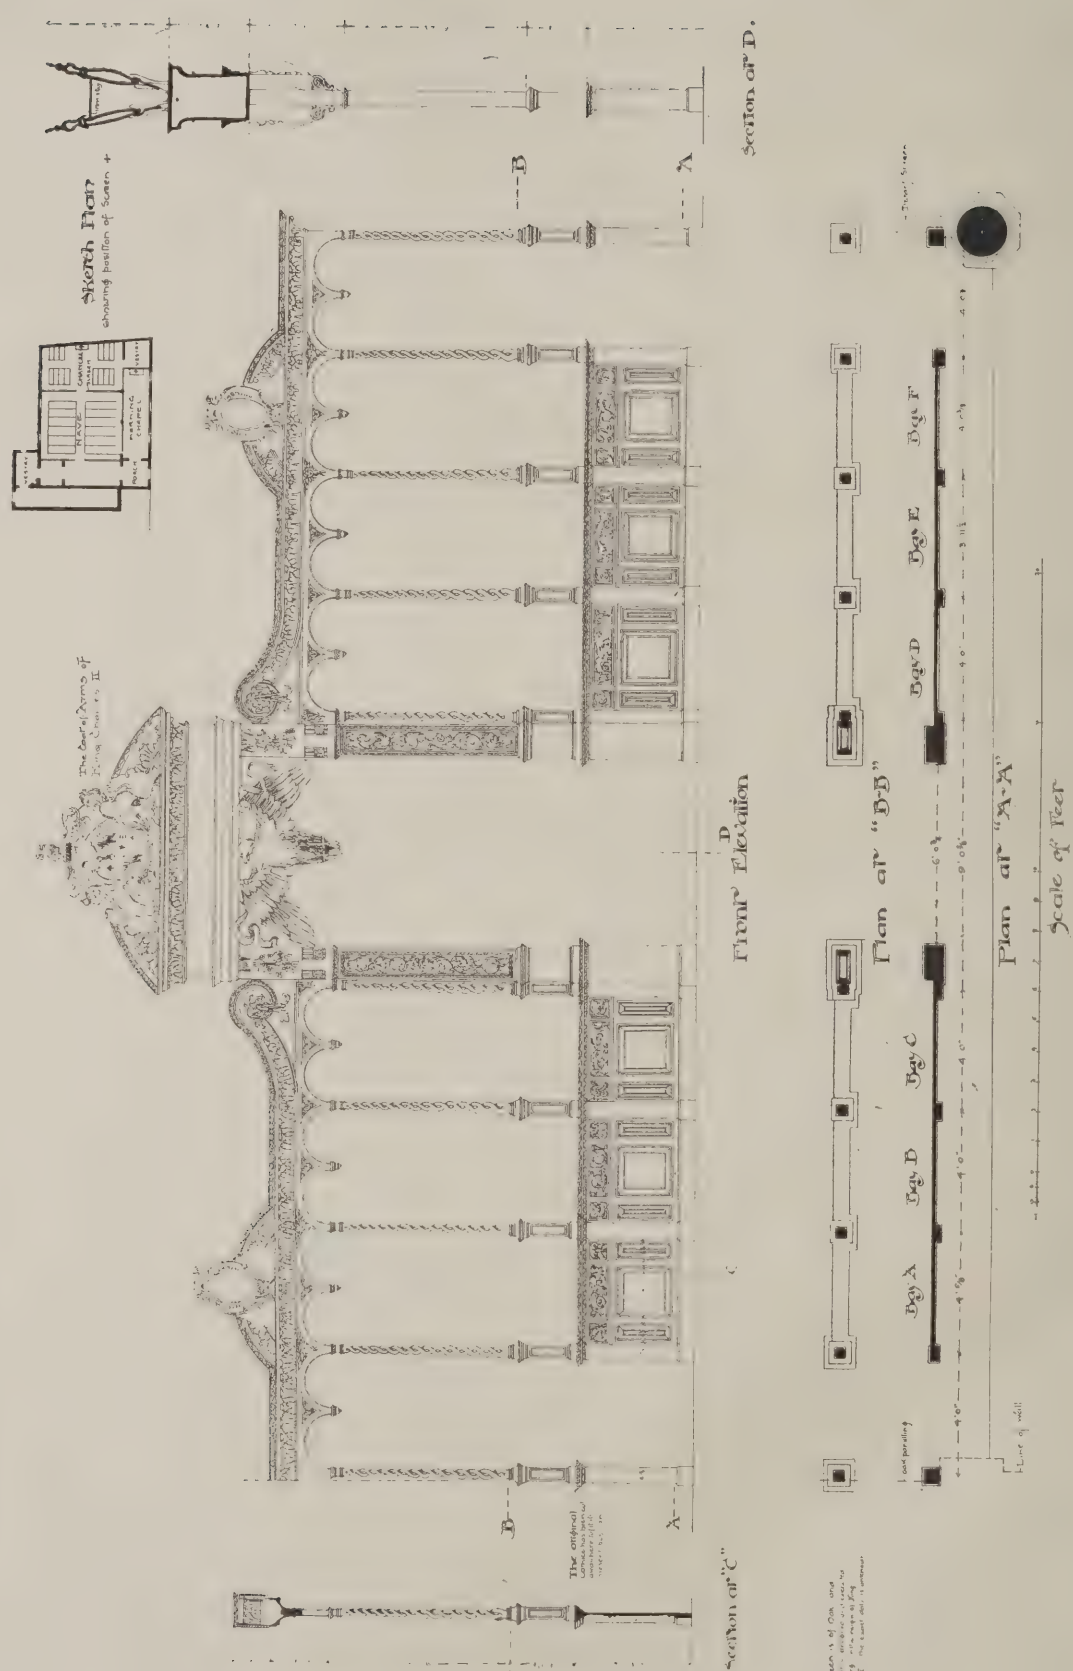

Mason clerks of works have proved themselves equal in every respect to carpenters and bricklayers—for instance at the Roman Catholic Cathedral at Westminster, and at many other buildings I could mention. Then the remark in Mr. Street's paper, "that is, if you happen to obtain the whitebed" (sic *whit*, for that is what he evidently meant) would be a doubt that need not exist, for certainly the whitbed is not selected in any way by chance by a practical man—whitbed would be whitbed, and basebed basebed, in his judgment. Unfortunately, basebed has been used in London on some important works externally, which I am quite certain the architects had intended to be best weather bed brown or whitbed Portland.—Yours truly, J. W.

R.I.B.A.

PROTECTING BUILDINGS AGAINST LIGHTNING.

A MEETING of the Royal Institute of British Architects was held on Monday evening last, when the president, Mr. William Emerson, occupied the chair. Mr. Alexander Graham regretted to announce the death of Mr. Benjamin Edmund Ferrey, F.S.A., who was elected an Associate of the Institute in 1868 and a Fellow in 1877. Mr. Graham then intimated that Mrs. Reynolds Rowe had presented a portrait of her husband, and a vote of thanks was passed for this gift. The secretary announced that Messrs. H. N. Kerr, W. H. Woodward and E. A. Young had been examined by the Institute and had been granted certificates of competency to act as district surveyors in London. Mr. Killingworth Hedges, M.Inst.C.E., M.Inst.E.E., F.C.S., then read his paper on "The Protection of Public Buildings Against Lightning."

Mr. Hedges began by a reference to points brought forward in his paper on "The Fire Risks of Electric Lighting," read before the Institute in 1884, and in Colonel Parnell's paper on "The Action of Lightning Strokes in Regard to the Metals and Chimneys of Buildings," read before the Institute in the same year. In the same connection were quoted opinions of Dr. Oliver Lodge, F.R.S., and Professor Kirchhoff, of Berlin. Since the report of the Lightning-Rod Conference in 1882 there had been no official report on the effect of lightning strokes on buildings protected by conductors, and he hoped his paper would elicit some expression of opinion from architects, who had more opportunities of observing such effects than engineers. Discussing the action of a lightning flash, the author called special attention to its surging effect, which had very destructive tendencies. Lightning conductors, as usually arranged, do not guard at all against what Dr. Lodge termed the "spitting" action. They may serve to discharge or pass off on to the atmosphere the induced electricity from the earth and from the buildings upon it; but as lightning protectors they are so arranged that should they be actually struck by a flash the building would probably be set on fire; there was a chance, too, that a portion of the electric current would be diverted into unearthed metal-work, and prove most destructive in its tortuous course to earth. For the sake of these public buildings it was necessary to explode the fallacy that a properly constructed lightning-rod never failed. During thunderstorms the atmosphere and all conducting objects in the immediate neighbourhood become charged with electricity at a constantly increasing potential or intensity as we recede from the earth. Even objects directly on the earth, such as railroad tracks, high fences, &c., become charged and will spark. The characteristics of a lightning flash more particularly concerning the present subject are:—(1) Surging, due to the oscillatory character of the spark, and consisting of a disruptive discharge, sudden and violent, more like the blow of a hammer; (2) Self-induction, a property which gives rise to counter force or choking effect, noticeable in straight wires, but much more pronounced in coils of wire; (3) Side-flash, the result of self-induction. A disruptive discharge will often leave what would ordinarily be called an excellent conductor and side flash through the air to other much worse conductors; for instance, the lightning-rod may be struck, but instead of following the course provided a side flash may select its own path through a wall of brick or stone to a neighbouring gas-pipe or bell-wire. The phenomena of surging and self-induction were described by the author and illustrated by diagrams.

In dealing with the question whether our public buildings are efficiently protected, the author first reviewed the methods formerly adopted for the protection of St. Paul's Cathedral. The spire of old St. Paul's was partially damaged by lightning three times, and its destruction by fire in 1561 was attributed to the same cause. The author had recently to

report on the lightning conductors put up at the Cathedral in 1872. These took the place of the original system erected under the advice of the Royal Society about 144 years ago. They were considered at the time to form the most advanced system of protection. The system was thoroughly overhauled by the author for the purposes of his report, and pronounced to be open to serious criticism. Elements of danger due to inadequate conductors, faulty connections, non-protection, and other causes were found to exist. Of the dome, statues, choir, and towers, none were efficiently protected. The author read extracts from his report, and fully detailed the weak points in the installation. This was an average specimen of the method of protecting public buildings. That more disasters do not happen is due to good luck and to the fact that the warm air ascending from the numerous chimneys in large towns helps to lessen the violence of thunderstorms; but should a direct flash strike an insufficiently protected edifice, a disaster would occur. Descriptions of continental and American practice were given by the author and details of installations on public buildings abroad which he had inspected. The method adopted at the Cathedral of Notre Dame, Paris, the author considered to be somewhat lacking; that at Cologne Cathedral was far more advanced, the work being carefully executed and of a design which might be followed with safety. At the Palais de Justice, Brussels, was installed the most recent adaptation of the Melsen system, details of which were given. The author next gave an account of his rearrangement of conductors for the better protection of St. Paul's. The plan recommended by him, taking into consideration the large amount of copper cable already disposed about the building, was, first, to run three new cables from the metal-work of the framework supporting the cross to the roof of the dome (making inter-connection with the iron supports of the structure); there connecting them with the eight existing conductors, and reuniting them at the base of the dome to the existing system, which is increased by running a new $\frac{1}{2}$ in. seven-ply copper cable on the top of the parapet entirely round the building. From this horizontal conductor, aigrettes, consisting of five pointed copper rods, were teed at intervals by means of special brass boxes tinned inside, into which the cable was placed, the aigrettes being first secured by binding and the whole united by running in hard solder. The method of obtaining efficient new earths (a matter of difficulty owing to the nature of the ground), the process of earth attachment, and the general arrangements were fully detailed and illustrated.

The installation should not be taken as a model one, except, perhaps, with reference to similar ecclesiastical structures, which do not lend themselves very readily to the improved methods of protection, such as the author recommended for all new public buildings. It is almost impossible to draw up a set of rules to be universally applicable; each building should be carefully studied, first, as regards its position with neighbouring structures; secondly, as to the disposition of the metal employed; and, thirdly, with reference to the subsoil and its suitability for earthing the conductors.

Under the head of practical questions, the author then recapitulated a number of rules and principles laid down by Professor Lodge, supplemented with suggestions of his own, his aim being to elucidate the possibilities of improvements in the erection and testing of lightning conductors. In conclusion, he warned those who had to specify methods of protection to put no faith in the generally received opinion that a certain space contiguous to a lightning-rod is completely protected by it, so that if the rod is raised high enough a building in this protected region is safe. Nothing was more illusory; no space near a rod could be definitely styled an area of protection, for it is possible to receive violent sparks or shocks from the conductor itself without taking into account the phenomena of surging and self-induction.

The paper was further illustrated by slides giving views of St. Paul's, Westminster Abbey,

Notre Dame and Cologne Cathedrals, and Rockliffe Church; also of lightning discharges showing, first, the popular representation of a flash of lightning, followed by others taken from photographs of actual discharges. These were lent by the Royal Meteorological Society.

On the table were specimens of the fittings designed by the author for St. Paul's Cathedral. A discussion followed.

Keystones.

Littleborough Church, Retford, has been re-opened after undergoing repairs.

A new **Wesleyan Chapel at Darwen** has been opened. Mr. J. B. Thernley was the architect, and Mr. R. J. Whalley the builder. The building is situated in Bolton Road and provides seating accommodation for 680 persons.

Mr. R. Randall, F.S.I., late surveyor, War Department, died at his residence, 1, Sunbury Gardens, Palmerston Park, Dublin, on April 20th. The deceased was sixty-six years of age, and retired only a year ago, so that he did not long enjoy his pension. During his career he was stationed at the War Office, Birmingham, Aldershot, Colchester, Halifax, and for the last thirteen years of his service at the Curragh, where he was responsible for the construction and finance of the great barrack scheme which is now in progress. He was also architect of the Church of Ireland Soldiers' Institute, Roman Catholic Soldiers' Institute, and Nurses' Home at the Curragh.

Roman Art.—A lecture (free) on "Rome" is to be delivered at the Passmore Edwards Settlement, Tavistock Place, W.C., on Saturday evening next, at eight o'clock. This is preparatory to the course of four lectures on "Roman Art, from Augustus to Constantine," which Mrs. S. Arthur Strong, L.L.D. (Miss Eugénie Sellers), will give on Fridays, at 8.30 p.m., commencing on May 4th. Lecture 1 will be "The Altar of Peace of Augustus"; 2, "The Arch of Titus"; 3, "The Column of Trajan"; and 4, "The Arch of Constantine." Fee for the course, 2s. 6d.; workmen and working women, 1s.; single lectures, 1s.; associates of the settlement, free.

Dundee Institute Competitions: Results.—The results of the competitions arranged by the Dundee Institute of Architecture, Science and Art have been announced. There were three entries for sketch work and the prize was awarded to F. Webster (Messrs. Keith and Sons' office). The exhibit of A. W. Lawrie (Mr. T. M. Cappon's office) in the section for a design of a golf clubhouse was placed first, and honourable mention was made of the work of A. S. Macrae (Mr. J. P. Bruce's office), and of John Soutar (Mr. Cappon's office). William Stocks (Mr. T. H. Thomas's office) has won the first prize for a design for a fireplace. There were six other sections, but one only competitor appeared in each, and the Council awarded suitable honorariums. The judges were Messrs. T. Ross, A. H. Crawford, and G. S. Aitken, Edinburgh.

Wages in Bradford.—The Bradford joiners have been conceded an advance of a halfpenny per hour on their wages from May 1st. Some months ago the local branches of the Amalgamated Society of Carpenters and Joiners gave notice of a demand for an increase from 8½d. to 9½d. per hour. The masters offered a halfpenny per hour, and after several interviews between representatives of the two societies the men have accepted this offer. A slight alteration in the hours of labour has also been agreed to by which during the six weeks before and the six weeks after Christmas the hours will be reduced to 7½ per day or 41½ per week.—The six months' notice of demand for an advance of wages from 8½d. to 10d. an hour which the Bradford branch of the Operative Stone Masons' Society gave to the masters will expire on May 1st, and the men have announced their intention to cease work on that day if the request is not complied with. They have refused an offer of an increase of a halfpenny per hour.

Professional Practice.

Bristol.—Funds are being raised for carrying out much-needed improvements at St. Paul's Church, in Portland Square. This church was opened in 1794 and it was described by a local historian as "a perfect architectural absurdity, belonging to no known order in art, nor allied to any style of building." The pews were re-arranged about fifty years ago, but they were not modernised, and, as stated in the circular, "this is probably the only church in Bristol where the worshippers are still seated in high pews with closed doors." Time and use have rendered the internal fittings obsolete, and they show manifest evidence of general decay. The flooring, too, is much worn and in need of renovation. It is proposed in the improvement scheme to reseat and refloor the whole of the nave and aisles, to remove the side galleries, to reconstruct the west-end gallery, provide new heating apparatus, and to thoroughly clean, paint, and decorate the whole of the interior of the

principal entrance is by a verandah, from which access is had to an entrance hall, about 15ft. by 12ft. To the left is the main corridor, 6ft. wide, leading to the public rooms, &c.; while to the right of the hall is placed the smoking room, adjoining the public bar, in connection with which there is a separate entrance from the outside. The private bar abuts on the hall. The accommodation on the ground floor consists of parlour, 20ft. by 17ft., and two dining rooms, 26ft. by 16ft. and 18ft. by 17ft. The latter can be thrown into one large room if necessary. Adjoining the dining room is the service room, with kitchen, scullery, pantry, and offices behind. The principal stair leads from the corridor to the upper floors, and there is also a service stair leading to all floors. Between these are placed the lavatory and w.c. On the first floor is the drawing room, 20ft. by 17ft., the remaining space being occupied with eight bedrooms and dressing rooms, with bathroom, water-closets, and housemaids' closets adjoining the corridors. On the upper floor is the billiard room, 26ft. by 18ft., and seven bedrooms, with bathroom, water-closets, &c. There is also a tower

On the ground floor is the dining hall, which, together with the principal entrance hall, occupies the centre of the front, and is distinguished both by projection and by a greater height than the remainder of the rooms on this floor. This apartment, which is 50ft. by 24ft., is being waiscotted all round with oak for a portion of its height, and the entrance hall is separated from the dining hall by an oak screen. It is intended to be used for entertainments as well as for refreshment. To the east and west of this central portion are respectively the women's and the men's wings. The women's wing contains an entrance hall with separate entrance and staircase, reading and writing room 19ft. by 18ft., and parlour 26ft. by 19ft. with a large bay window. In this wing are also situated the business room and the matron's sitting room. The men's wing contains a similar entrance and staircase, reading and writing room 19ft. by 18ft., parlour 18ft. by 14ft., and billiard and smoking room. A verandah extends in front of each wing for the use of the patients. A straight corridor runs behind the above-mentioned rooms from one end of the building to the other, and at the ends are placed box rooms, lavatories, cloakrooms, &c. On the north side of this corridor are the offices containing kitchen, scullery, servants' hall, and store rooms, all admirably placed for the control of the matron and the service of the patients. On the first floor are the bedrooms, those for men being—as in the case of the day rooms—in the west wing, and for women in the east wing. In these the cubicle system has been adopted, the space being divided, by means of wood partitions 7ft. high, into rooms for two or three beds. The windows of the cubicles on the south front are treated as French casements, opening on to the balcony over the verandahs, and permitting patients to be wheeled outside. Lavatories and bath rooms are provided at the ends of the wings, as on the ground floor, and at each end there is an emergency door and an outside escape staircase in case of fire. The central portion over the dining and entrance hall, is divided into two parts—that to the front being sub-divided into cubicles, and so planned that it can be used as an alternative ward for either wing, so as to provide for the fluctuation of the relative number of patients of each sex; that to the back being sub-divided into cubicles, baths, &c., for the servants. Two separate rooms for use in case of sickness are also provided—one in each wing—and quite separate from the other bedrooms for isolation. The building, which is crowned in the centre by a lofty clock turret, is faced all round with the Enfield Company's best deep-red pressed bricks from Accrington, with Matlock stone dressings. All the floors are of solid concrete construction, and will be covered with pitch pine blocks and terrazzo mosaic. The general contractors are Messrs. Dawson and Jones, of Huddersfield and Sheffield. The almshouses, which form part of the Woodfindin bequest, stand at the corner of Eccleshall Road and Brocco Bank in a convenient situation, with a southern aspect, and close to the public park. Treated somewhat in the mediæval style, they make a picturesque block of buildings, and harmonise with the neighbouring church of St. Augustine in the background. They are in three blocks of six houses each, forming a quasi crescent in plan, standing upon a raised plateau with a terraced roadway in front and carried round the back of the buildings. The Porter Brook passing through the grounds has been bridged over at the west end to form a carriage entrance and a rustic footbridge spans it as a shorter communication citywards. The walls are faced with red bricks from the Thurstonland Works, near Leeds, with dressings of Stoke stone, the roofs being covered with Broseley tiles. Each almshouse contains a complete living room, scullery, and larder, with the usual offices. There are two bedrooms on the upper floor, and the centre block, in addition, provides a large reading room for the use of the inmates. The designs for the almshouses have been prepared and carried out by Mr. W. R. Bryden, F.R.I.B.A., of Buxton, Derbyshire, the builder being Mr. James Salt, of Buxton.

PRESBYTERIAN CHURCH, ALTENBURG GARDENS, CLAPHAM COMMON, LONDON, S.W.
E. BECKITT LAMB, ARCHITECT.

church. Plans are being prepared by Mr. G. H. Oatley, F.R.I.B.A., of Bristol, and the estimated cost of the scheme is £1,200.

London, S.W.—The architect of the Presbyterian Church at Clapham Common, of which an illustration is given on this page, is Mr. E. Beckitt Lamb, of Craven Street, Charing Cross. The drawing shows the front elevation, which was, however, somewhat altered, owing to larger accommodation being afterwards required in the hall at the rear. The church and hall together accommodate more than 700 persons, and vestries, ladies rooms, lavatories, &c., are provided with easy access from both parts of the building. The total cost was about £3,500.

Glenfarg, Perthshire.—A new hotel has been built adjoining the station and fronting the Great North Road from designs by Mr. David Smart, architect, of Perth. The prin-

room, which can be used as a bedroom or a smoking room. On the basement floor are the washing house, laundry, and beer, wine, and coal cellars, &c. The cost of the new hotel has been about £4,000, and the style is modified Scottish Baronial.

Sheffield.—The convalescent home which is now being completed in Whiteley Wood is the gift of the late Mr. George Woodfindin, and is in the Renaissance style of architecture. Messrs. Hemmell and Paterson, of Sheffield, are the architects. The site contains about 16½ acres—sufficient, it is hoped, to protect the home from surrounding buildings—and a carriage drive has been constructed through the property from Whiteley Wood Lodge to Fulwood, thus affording two approaches to the home. Accommodation is being provided for about forty patients. All the patients' day rooms and bedrooms are arranged in a southerly direction. The building is two storeys high.

Engineering Notes.

The Gladstone Schools, Cardiff, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Halifax Tramway Extension.—The Halifax Tramways Committee have decided to commence the extension of the Illingworth tramway to Causeway Foot. Causeway Foot, although within the borough, is some three miles distant from the centre of the town. It is in close proximity to Ogden Reservoir, a popular pleasure resort.

New Tunnel at Thackley, Bradford.—The new tunnel which is being constructed at Thackley in connection with the widening of the Midland Railway between Leeds and Bradford is nearing completion. Recently the bricking of the tunnel has progressed at a rapid pace, so much so that there is every reason to believe that three months' time will see the work absolutely finished.

Proposed New Wear Bridge at Sunderland.—The scheme for constructing a bridge over the river Wear between Southwick and Deptford is not to be allowed to drop because of the rejection of the Sunderland Corporation Bill. It is understood that the Corporation, the North-Eastern Railway Company, the River Wear Commissioners, and the Southwick Urban Council have practically arranged the basis of an agreement as to bearing the cost of the structure between them.

Proposed Bridge Alteration in Connection with the Glasgow Exhibition.—A letter has been received by the town clerk of Glasgow from Mr. Hedley, the general manager of the Glasgow 1901 International Exhibition Association, asking permission for the removal by the Exhibition authorities of the present iron bridge across the Kelvin in Kelvingrove Park leading to Radnor Street. Mr. Hedley states that the bridge is out of line with the main front of the Exhibition buildings, and that the architect strongly recommends the erection of a temporary wooden bridge for the purposes of the Exhibition in line with the main entrance to the building. The matter was remitted for consideration and report to a sub-committee of the Corporation.

Electric Tramways for Newcastle.—On Thursday last the first rail was laid of the new electric tramways, on the overhead trolley system, which in Newcastle are to supersede the system of horse traction that has prevailed since the beginning of tramways in the city, more than twenty years ago. The cost of "construction and equipment" was put down, originally, at £400,000; it has already been swelled to nearly half a million sterling, and is likely enough to be very much more before the end comes. The total length of the routes is twenty miles, and, as the whole of the tramways are to be doubled, there will be just forty miles of track. The gauge is 4ft. 8½in. throughout. The construction of the tramways is being carried out by Mr. Edmund Nuttall, of Manchester, and the work is to be completed by April, next year.

Across New York.—The growth of New York has rendered the question of transporting the population between their homes and their places of business one of increasing difficulty. Were they compelled to depend upon surface cars running at the highest rate of speed compatible with safety, those living in the more remote sections would be compelled to pass one-half of each working day in going to and from their business offices. The elevated railroads relieved the pressure for a time, but it was at the expense of the convenience of those living upon the streets where the cars ran, and now the elevated systems are unable to handle the congested traffic of mornings and evenings. It is now proposed to meet the difficulty by the construction of an underground system that shall extend from the City Hall to the upper part of the Borough of Bronx. The main line will extend as far as Ninety-Seventh Street, a distance of nearly seven miles. This tunnel will be 50ft. wide and 13ft. high, and will

have four tracks, the two outside tracks being for local trains stopping at nearly every cross street, the two inside tracks for express trains stopping at about every six blocks. Beyond Ninety-Seventh Street the road separates into two branches with two tracks in each, upon which local trains only will be run. When the Harlem River is reached the tracks will divide, and each will pass under the water in circular cast-iron cylinders 15ft. in diameter. The motive power will be electricity, and all conveniences for the comfort of the passengers will be introduced. The engineering problems are interesting, particularly in the lower section of the road, where street traffic is extensive and cannot be disturbed. The first mile is through sand, but as there are no high buildings in this section, no difficulty is anticipated from this source. The remainder of the road is through rock, and the tunnelling will not disturb the foundations of the buildings. The contractors are to be allowed to open trenches not more than 400ft. long, and extending only one-half across the street. No two openings are to be less than 500ft. apart, and no trench may be kept open more than thirty days without the consent of the owners of adjoining property. Some idea may be gained of the magnitude of the work from a few of the figures of construction. The total length of all sections will be slightly more than 20½ miles; the length of track will be nearly 58 miles. It is estimated that three years will be required for construction, and that an army of 8,000 to 10,000 labourers will be employed. The contract price is 35,000,000dols., and the contractor is John B. MacDonald.

New Patents.

These patents are open to opposition until May 28th.

1899.—Incandescent Gas Mantles.—6,919. J. H. H. DUNCAN, THE NEW INCANDESCENT (SUNLIGHT PATENT) GAS LIGHTING CO., LTD., both of London; and H. T. BARNETT, Teddington. Mantles made according to this invention consist of variously treated filaments or cords woven, twisted, or combined together in such a way that the colour of the light emitted is variable—that is to say, the colour depends on the precise combination of strands.

Pipe Pliers—7,468. A. G. BAYLES, L. D. DE SAUSSURE, and T. HERRON; all of New York, U.S.A. The body of the pliers is made of untempered metal, while the jaws are fitted with tempered serrated plugs, each held in place by a screw. When the jaw becomes worn the part can be removed and a new plug easily fixed in place. The pliers is thus made more durable.

Blocks of Concrete and Cement.—8,084. W. H. BAKER, Bristol. The object of this invention is to make blocks of concrete or cement for building purposes without employing pressure. The mould has a perforated bottom covered by a piece of unglazed porous paper, and movable sides and ends; it lies on a frame which can be rocked by a shaft. When the material has been put in, the machine is started and the mould is shaken, the water filtering through the paper, and afterwards the block is allowed to stand and harden. The mass is not disturbed in setting, as is the case when ramming is employed, nor is the water expelled too hastily, and the resulting slab does not need to be faced after production, and is less liable to lamination than slabs made under pressure.

Sleepers for Portable Railways.—9,923. R. MANTLE, Dudley. The sleeper is made of rolled iron or steel and has three ribs on its underside—one in the centre and one at each side. The ends are turned over, and the rail is held between them and curved pieces of metal riveted to the sleeper.

Ventilators.—11,312. R. MACKAY, JR., Glasgow. The air in the shaft or channel

leading to the ventilating turret or outlet is heated by means of an electric coil, disc or radiator, the current for which can be controlled by a switch.

1900.—Paint Brushes.—3,349. G. C. DYMOND, Manchester (*The Vereinigte Pinsel-fabriken, Nuremberg*). The bristles are compressed into a stout metal ferrule or cap which fits into a slotted recess in the brush handle. Wire is wound round the latter to complete the fastening. By another method, the bristles are held in position by a nail contained in the middle of them being driven into the stock.

The following specifications were published on Saturday last, and are open to opposition until June 14th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—6,528, SIMS, HARROP AND HARROP, automatic and intermittent syphon flushing tanks and cisterns. 6,770, STUMPF, windows. 6,782, COOMBS, door check. 6,992, SCHLOSSER AND MOERES, switching contrivances for two electric incandescent lamps connected up together. 7,136, STANLEY AND STORMONT, appliance for use with paint brushes. 8,315, FARNHAM, brushes. 9,360, GERNAERT, manufacture of artificial or cast marble. 9,844, STAMPS, manufacture of metallic knobs or vases for door furniture, &c. 9,963, BOURNAL (*Elder*), traps for drain pipes. 10,439, HODDER AND LESTER, manufacture of gas for lighting and heating. 10,608, MORRISON, conduits for electrical conductors. 10,711, LILLEY AND LILLEY, folding rules. 10,845, TEE, incandescent gas lamps. 10,945, HILL, fastening brushes to handles. 10,994, HAM, manhole covers for sewers. 11,078, CHRYSTAL, manufacture of mortars, also applicable as fireproof, soundproof, or non-conducting compositions. 11,279, PREAUBERT, manufacture of decorative fabrics for use as wall-hangings. 11,298, WALL AND BALSON, pivoted reversible sliding sashes for windows. 11,302, WHITFIELD, apparatus for removing pitch from paving stones and paving blocks. 11,350, LEECH, metallic boxes, cases, tanks, cisterns, &c. 11,431, LIVESEY, street lamps. 12,114, SCOTT, electrically-driven fans. 12,799, BARBOUR, locking or fixing screws. 12,956, COMPAGNIE ELECTRO METALLURGIQUE DES PROCÉDÉS GIN ET LELEUX electric furnaces. 22,059, TURTON, tool holders for slotting, shaping, and planing machines. 22,625, FOULGER AND GLOVER, lighting torches for incandescent gas lamps. 23,082, FOULGER AND GLOVER, means and apparatus connected with the lighting of street lamps. 24,901, ADAMS, baths. 25,164, SCHMIDT, electric igniting devices for lighting gas and similar lamps. 25,755, SCHNELLE, brick-cutting machines.

1900.—171, WHEATAM, stone sawing machine. 519, PARBEL AND MEISSNER, bolts and nut locks. 891, LAKE (*Sykes*), lathing for buildings. 1,200, SMITH, adjustable bracket for the support of shelves. 1,479, RICHARDSON, gathering irons for glass working. 1,705, OLSCHESKY, devices for slaking lime and drying artificial stones. 1,996, DRESSER, device for stopping leaky joints in gas pipes. 1,997, DRESSER, pipe-coupling. 1,998, DRESSER, repair device for stopping leaky pipe joints. 2,288, DUNCAN, water meters. 2,343, HOWARD, furnaces. 2,375, TAYLOR, window frames. 2,714, FENLON, taps or valves for geysers and similar water heaters. 2,790, HEERDT, glass-blowing machines. 2,886, WUTH, manufacture of cement. 3,123, TAYLOR, windows. 3,277, FORDYCE AND DUNCAN, machines for making expanded metallic lathing. 3,359, LOOS, dust carts and receptacles for use in connection with such carts. 3,373, FERGUSSON, door locks or latches. 3,448, ADAMS, door-closing appliances and checks. 3,590, BOULT (*Wangelin*), flushing tanks for water-closets. 3,626, HARTMANN AND THEIL, wedge for fixing handles in axes, hammers, &c. 3,724, MORTERUD, furnaces and fire-boxes for effecting smokeless combustion. 3,735, HEINROTH AND TERESNEBREUTER, incandescent gas burners. 3,739, SANNY, washing-out apparatus for water-closets.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Old houses mended

Cost little less than new before they're ended."—

COLLEY CIBBER.

Kensington Palace Approach. THE approach to Kensington Palace from the High Street has now been made worthy of its history and its purpose. A pair of handsome iron gates have just been furnished to the piers still surmounting the lion and unicorn supporters of the Royal arms. The old gateway is quite in the Hanoverian style, or indeed older still, and the lion and unicorn are of the usual rampant type. The gates are a little more restrained in design—the V. R. is almost Tudor in its effective severity, and it is noticeable that the crown is an Imperial one. Now that the Queen's rooms are free for all Londoners to visit, the gates that give access from the roadway are made imposing and "practicable." Till now they were not considered. We cannot fancy the approach to any little ducal palace in Germany to be so unpretentious or so little regarded and it is gratifying that this much-needed improvement has been effected.

The British School in Rome. AFTER a preliminary exchange of views during the winter, it has now been decided to give practical form to the idea of founding a British School of Archaeology and Classical Studies in Rome, and to place the school as soon as possible on a working basis. A well-qualified director, Professor Rushforth, has been selected and appointed by the central permanent committee. Professor Rushforth will, as soon as his health permits, proceed to Rome to arrange on the spot for the preliminary organisation of the school. Professor Charles Waldstein, Slade Professor of Fine Art, a member of the central permanent committee, has, on behalf of Professor Pelham and his colleagues of the committee, been in consultation with Lord Currie, British Ambassador to the Quirinal, and with other resident supporters of the school, in order to consider the best method of securing its prompt organisation as a working institute. At a meeting held on April 18th at the British Embassy, under the presidency of Lord Currie, and attended by Professor Charles Waldstein, Sir Lawrence Alma-Tadema, Mr. Bliss, Mr. St. Clair Baddeley, and Messrs. Ashby, senior and junior, it was recognised as advisable that the school should be started as soon as Professor Rushforth has recovered from his present indisposition sufficiently to undertake the work of organisation. It is understood that the central committee disposes of enough funds to enable a good start to be made and work to be carried on until it may be practicable to recommend the school to the attention and support of the public. Communications which have passed between the committee and various learned societies of the United Kingdom have shown that a number of students of archaeology, architecture, classical MSS., and medieval history are ready to proceed to Rome as soon as arrangements have been made for a regular direction of their studies. It is, therefore, hoped that before the spring is far advanced the British School in Rome will have come definitely into being.

The House Unbeautiful. WE take the following extract from the "Pall Mall Gazette":—"I had walked for miles along a ridge where wood and heather alternated. . . . For two hours I had met no living soul, and was not surprised to find myself footing softly, as one afraid to disturb so benign a solitude. It was in this mood that I came upon the house. It was some twenty yards to the left of the track I followed, and was approached by a path almost invisible and trailed across by brambles. The gate hung limp upon its hinges, and unlatched. One gable-window was overtilted by some slipped tiles, which formed a kind of heavy eyebrow;

most of the roof had fallen in; and through the broken windows, where the sunlight lit the walls, I could see the marks of fire. Over the doorway was an escutcheon, bearing arms and an almost obliterated date. I pushed through the gate and approached the entrance. The date, after some difficulty, I decided to be 1673. . . . I turned the handle of the door, and pushed; the lock gave way, and I stepped into the midst of ruin. The floor was strewn with tiles, charred woodwork, scraps of metal. The upper floor had collapsed with the fall of the roof, so that the blue sky looked in upon the place. Only one piece of flooring remained, and that was supported by an iron column and still partly enclosed, as though it had been a cupboard. In places ivy was busy hiding the desolation, and in one corner a patch of nettles flourished, rank and green. I turned over a heap of rubbish with my stick and disclosed the half-melted works of a clock. . . . I got into the outside air again with a sense of acute relief; but the spell of the place was upon me, and I made my way round to the back. A garden, overrun and wild, with roses degenerated to their briar stock, stretched to a little wood. Inequalities in the ground indicated where beds had been; in one corner a great yew stood, black. I reached the centre of the garden and turned. That side of the house was ruined, like the other; but, on the right, on the first floor, was a window that seemed to have escaped the fire. My breath caught for a moment, and then I struck quickly through the broken hedge and hurried away without once looking back. The window was barred."

St. Patrick's Cathedral, Dublin.

IT was discovered some time ago, on an examination of the fabric by the architect of the Cathedral Board, Mr. Thomas Drew, that the eastern end of St. Patrick's Cathedral, Dublin, was in anything but a safe condition. The two eastern buttresses became considerably out of the perpendicular, so much so that it has been found necessary to take them down and reconstruct them. But further, the Caen stone, which was extensively employed in all the dressings of the windows and other parts of the sacred edifice has crumbled away piecemeal by the action of the weather, and is to be replaced by Portland stone. Lord Iveagh, the liberal and constant friend of this historic and venerable shrine, on learning Mr. Drew's report of what it was essential should be done, forwarded £1,000 to the Dean, the sum requisite for erecting the necessary scaffolding so as to be able to make a thorough examination of the nature and extent of the decay. The same munificent donor is now defraying entirely the very large expense of the masonry work which is at present in progress. It should be stated, however, that the defects mentioned have not occurred in those portions of the cathedral which had been restored by Lord Iveagh's father. Some forty years ago Sir Benjamin Lee Guinness—a frequent visitor to the Cathedral—observing almost everywhere signs of impending ruin effected a splendid renovation out of his own private purse, at an outlay of no less than £150,000.

New Florentine Casts at South Kensington.

AMONG the more recent acquisitions of the Victoria and Albert (South Kensington) Museum are a series of casts from Florentine sculptures, which very happily complete the collection already surpassingly rich in this respect. Thus we have the somewhat rude marble figure, "St. John the Baptist," by Donatello, from the Museo Nazionale of Florence, and his sublime "St. Francis," from S. Antonio, at Padua—perhaps the most perfect representation of physical suffering dominated by spiritual serenity that Italian art affords. The "David Triumphant" of Verrocchio, also from the Museo Nazionale, is so familiar as to need no new description, and the same may be said of the charming "Giovannino" of Benedetto da Majano. Donatello's strangely-mannered and strangely-fascinating pupil, Agostino di Duccio—whose chief work is the façade of the Oratoria di San Bernardino, at Perugia

—makes his first appearance at South Kensington, casts being now exhibited of his beautiful "Madonna and Child, with Angels," from the little museum of Santa Maria del Fiore, at Florence, and from two interesting reliefs, "Agriculture" and "Music," which adorn the church of S. Francesco—otherwise, the Tempietto—erected by the tyrant Sigismondo Pandolfo Malatesta at Rimini.

An Old Village Cross.

NORTH LEN, a village about six miles from Okehampton, has a reputation for coldness and bleakness and, according to the local tradition, it was here that the Devil died—from cold—and was interred beneath the steps of the ancient preaching cross that was erected on the village green by the monks of Tavistock Abbey. This cross was broken during Puritan times, and it is now to be restored according to the designs of Mr. E. Fellowes Prynne, F.R.I.B.A. The three octagonal and moulded steps with the die on top of them are still happily intact. There will be a tall new shaft, a monolith of grey Dartmoor granite, square on base, octagon in section higher up, terminating in a moulded capital with a square abacus. Upon the top of the latter the original thirteenth century capstone will be set. The work of actual reparation has been placed in the hands of Messrs. Hems and Sons, of Exeter, and it is anticipated that all may be completed so that the re-dedication of this time-honoured, and for ages time-desecrated, old cross, may take place upon the festival of St. Thomas-a-Becket.

The Bosco Reale Frescoes.

THE verdict of the archaeologists and the special students of Roman and Græco-Roman painting with regard to the new discoveries at Bosco Reale, near Vesuvius (see page 115 of our issue for March 21st last), will be awaited with interest. On the same spot where a few years ago was found the unique treasure of Greek and Roman silver-smiths' work, the finest pieces of which were acquired by Baron Edmond de Rothschild, and by him presented to the Louvre, have been laid bare the ruins of a vast and splendid Roman villa. First there were found the mosaics of an atrium; then four chambers, preceded by a peristyle, decorated with frescoes as remarkable for their perfect preservation as for their extreme beauty. In one of the palatial chambers are no less than fourteen figures exceeding life-size by a metre and a half, and some of these would appear to be portraits. Should the information furnished prove to be exact in this particular, these frescoes would stand alone, as regards dimension, among extant paintings of the same type and epoch. In another room are groups of women in diversified attitudes, a citharist splendidly attired, a seated gladiator, and a female figure supporting a shield. The connoisseurs who have had an opportunity of seeing them pronounce these paintings to be the finest that have hitherto been discovered, whether at Pompeii or Rome.

What Becomes of Old London?

THE announcement that a large number of the stone balustrades of Kew Bridge, which is now being actively demolished, have been bought to decorate the terrace of a country house reminds us that, although old London is disappearing with mournful rapidity, there is at least some salvage from the wreck. The destroyed bridges of the capital have not, indeed, been doomed to disappear altogether. Bits of the extremely picturesque old Putney Bridge still exist, while one of the alcoves from the first London Bridge that was built of stone stands in Victoria Park, and another is in the grounds of Guy's Hospital. But objects more important and more interesting than these have managed to escape the wreck of centuries. Almost within sight of Kew Bridge is Sion House, and over its river front still stands, looking towards London, the stiff-tailed Percy lion, which so long kept watch and ward over Northumberland House at Charing Cross. The fate of Temple Bar is familiar enough. Another bit of old London which was familiar to all of us until the early

eighties was Bird's statue of Queen Anne in front of St. Paul's Churchyard. It is now in Mr. Augustus Hare's gardens at Holmhurst, Sussex. The sad case of the equestrian statue of the Duke of Wellington, which was deported from the arch at Hyde Park Corner to Aldershot, is too recent and too familiar to need discussion. In the early days of the century one of the most popular sights in London was the performance of the giants who struck the hours at old St. Dunstan's, Fleet Street. Time came when, seventy years ago, the universal fate befel them. The church was pulled down, but the giants, with their clock and bells, were bought by the Marquis of Hertford for 200 guineas and moved to the grounds of St. Dunstan's Lodge in Regent's Park, which Decimus Burton built for him. The house now belongs to Lord Aldenham, who also preserves there what is left of two of the statues upon Lud Gate.

Far-away Fragments.

MANY pieces of old London stand far away from their original habitat. The staircase of Brandenburg House, Hammersmith, where Queen Caroline lived for some years, is, with other relics of the building, in a house in a Northumberland village; portions of Ald Gate are at Rothley Castle; two of the monuments from the destroyed church of St. Dionis Backchurch are in Hawkstead Church, Lancashire. But the richest of all spots in the architectural flotsam and jetsam of the capital is the odd little town of Swanage. For the façade of its town hall it has the front of old Mercers' Hall which once stood in Cheapside, while close to the wooden pier stands the elaborately pinnacled clock-tower erected on the south side of London Bridge to the memory of the Duke of Wellington. Some minor relics are also to be seen at Swanage, having found their way there in consequence of the connection with the place of Messrs. Mowlem and Co., the contractors. Coming nearer to London we find Weybridge in possession of the real Seven Dials column, which was taken away from its original abiding place a century-and-a-quarter ago. It was not, however, until it had lain derelict for fifty years that the thrifty people of Weybridge bought it for conversion into a memorial of the Duchess of York. Mr. W. S. Gilbert possesses and cares for the statue of Charles the First from Soho Square; the splendid staircase from Baron Grant's short-lived house at Kensington is now at Madame Tussaud's; what was St. Mildred's, Poultry, lies awaiting re-erection in the park of a Lincolnshire country seat. And let us not forget that Clifton Suspension Bridge was constructed largely from the materials of old Hungerford Bridge. Thus we see that, making allowance for South Kensington and the Guildhall Museums, bits of old London are "scattered far and wide, by mountain, stream, and sea."

The Emperor's Cathedral.

WHILE a new cathedral is gradually nearing completion in the south-west of London, the scaffolding which for more than five years has enshrouded the Kaiser's Cathedral at Berlin has been removed, and we are now enabled to form some sort of notion of what this great church is to be like. It occupies the site of the old Dom, between the Lust Garden and the Spree, almost opposite the most ancient portion of the Royal Schloss, and probably the finest position in Berlin. The Kaiser intends it to be the finest Romanesque church in Germany. But the cathedral makes the worst of first impressions. The element of stateliness seems altogether lacking. Orders were given the architect that it had to be the highest church in Berlin, and this order had to be obeyed. The architect, Herr Raschdorff, cannot be blamed, except in so far as he has permitted his better judgment to be set aside by those more or less ignorant of the true canons of Renaissance architecture. The roof has been raised to such a height as to give the impression that the whole building is hampered, confined, squeezed in. The lines of curve of the cupola have been fantastically

interrupted in order that a platform might be built upon it, from which a slender lantern soars—the lantern, by the way, full of unnecessary points and summits—a grotesque ending to the smooth lines of the dome. The immense surface of the dome is, moreover, of an unspeakably ugly brown. When the copper, of which it is composed, becomes oxidized, the green may contrast harmoniously with the light sandstone of the walls; at present it is hideous. But above all else one cannot but condemn the pretentious and all too lavish ornamentation. The entrance on the south side is a notable example of elaboration in the worst taste. It is not yet definitely known when the Kaiser will have the cathedral consecrated. The interior decoration, which is also to be most elaborate, is being pushed on with speed, and it is possible that all will be ready somewhere in 1902. It is the Kaiser's wish to make the new cathedral the burial place of the Hohenzollerns and of those among German statesmen whose services for the Fatherland are of transcendent merit—a sort of German Westminster Abbey, but lacking the great broad national character of the renowned British fane.

Excavations in Crete.

THE Athens correspondent of the *Times* says: "The excavations recently instituted on the site of ancient Knossos, near Candia, under the joint direction of Mr. Arthur Evans and Mr. D. G. Hogarth, have already begun to furnish important results. On the hillside opposite the famous palace site at Kephala a Mycenaean building has been discovered by Mr. Hogarth, which, so far as it has been cleared, seems to consist of three halls, in two of which stand square pillars—a feature not hitherto apparent in structures of this period, except in a rude form at Phylakopi, in Melos. The walls were faced with thin slabs of white gypsum, many of which remain in their places, and the floors are paved with similar slabs. The masonry presents novel features, among these being masons' marks in the 'Cretan script.' In what was apparently the tank of the house were found about forty vases, mostly capable of restoration, and all of the pre-Mycenaean period. The building, which is perhaps a temple, contains no trace of anything Roman or Greek."

Mr. Belcher's New Building.

THE foundations of a great building for the Eastern Telegraph Company are being laid at the corner of South Place and Finsbury Pavement. This will be from the designs of the newly-erected A.R.A., Mr. John Belcher, architect of the neighbouring Institute of Chartered Accountants' building, and will be of an imposing nature. Meanwhile, the demolition of the old Ophthalmic Hospital and the Roman Catholic Church of St. Mary, Moorfields, goes on apace. It is stated that the site of the church has been sold for £202,000, and that a large portion of this sum will be applied to the building fund of the Roman Catholic diocese of Westminster, whose new cathedral is now being erected behind Victoria Street.

Architecture at the Royal Scottish Academy.

THE architectural section at the Royal Scottish Academy this year is very disappointing. There are forty-eight exhibits, nineteen of which were done for competitions or are "proposed" erections, leaving twenty-nine representations of actual work. Of these again, to carry the analysis a little further, a good dozen are gate-lodges or other works of quite minor interest, leaving some eighteen frames in this national exhibition of the Fine Arts to chronicle the year's output. Further, of the architect members and associates (nine in all) four are absent, namely, Dr. Rowand Anderson, Mr. Leiper, Mr. Washington Browne, and Mr. David Robertson, while of the remainder, only two, Mr. Burnet and Mr. Kinross, are at all worthily represented. Of the competition and "proposed" drawings no fewer than seven frames are devoted to various solutions, with

a remarkable similarity to each other, of one subject—the Mid-Lothian County Buildings. Of public buildings erected or in course of erection, only two, and these of minor importance, are shown—the Carnegie Free Library, Dumfries, and the Public Hall, Edinburgh. It is the more to be regretted that commonplace is the mildest epithet that can with truth be applied to both. The examples of ecclesiastical art exhibited require little comment, with one notable exception, that of Greyfriars, Elgin, as restored for the Marquis of Bute by Mr. John Kinross, shown in two frames, Nos. 533 and 549, the former containing a plan and general view of the exterior, the latter a perspective of the chapel interior and one of cloisters. The only examples of office architecture are Mr. J. J. Burnet's Waterloo Chambers and Atlantic Chambers, Glasgow, Nos. 511 and 521, which show a bold and careful treatment; but Mr. R. S. Lorimer's "Hallyards," Peeblesshire, No. 547, is quite the best design for a house in the room. It may be mentioned in closing that, unlike all modern exhibitions of importance—with the sole exception of its sister academy, the R.A.—the Royal Scottish Academy refuses to admit photographs of architectural work.

The Late M. Falguière.

M. FALGUIÈRE, one of the most famous of French sculptors, died last week at his Paris residence after a painful operation for an intestinal malady. He lately fell ill at Nîmes, where he insisted on going in order to be present at the unveiling of the statue of Alphonse Daudet, which was the last completed work of his hands. The deceased artist was born at Toulouse in 1831 and obtained the Prix de Rome in 1859, after having already exhibited in the Salon. In 1875 he gained a medal for painting, but his claims to celebrity rest chiefly on his statuary work, such as the Corneille Memorial, for the Théâtre Français, his Ophélie and the Diane. M. Falguière was also commissioned to execute the La Fayette Monument for the city of Washington, United States. He was brought into much prominence of late years owing to the agitation over the Balzac Memorial. His friend, Rodin, made a Balzac who appeared to be suffering from elephantiasis, and the figure was subjected to so much ridicule that the horrified members of the Literary Society refused it. Then M. Falguière executed a sculptured presentment of the voluminous novelist which was accepted. In order to show that he had no animosity against his brother in art, Falguière started a bust of Rodin, and the latter returned the compliment. The Rodin bust still remains unfinished in M. Falguière's studio.

The Salon.

THE Society of French Artists has opened its annual exhibition a good deal earlier this year than usual (it used to open on May 1st); the Exhibition may probably have something to do with this. There are fewer pictures shown this year, though they are better in quality than those shown at the last Salon. It is an unfortunate fact, but there appears to be a mechanical repetition being practised by the majority of the exhibitors and a consequent lack of originality, in which faults M. Bouguereau, M. Dupré, M. Bail Joseph, M. Jules Breton, Mme. Romano and Mme. Demont-Breton all share. These painters have produced a certain type of picture and seem to copy it, probably because they find it pays, for there is a decided absence of art for art's sake at the Salon this year. There are, however, exceptions; M. Benjamin-Constant is one of them and his portraits rank high. Another feature of the exhibition is the prominence of the works of foreign artists and subjects. Brozik's "Proclamation of George of Podiebrod as King of Bohemia" is a very fine treatment indeed, and Wertheimer's picture, "The Waves," is strikingly original. But, as a whole, the exhibition is greatly lacking in spirit and power, which have perhaps been carried off to the Grand Palace to form a vis-à-vis to the productions of foreign rivals.

Surveying and Sanitary Notes.

Institute of Sanitary Engineers.—At a meeting of the Election Committee held on April 11th the following gentlemen were elected:—As Members: Mr. S. Crawshaw (India), and Captain C. H. Vasturme (Woolwich). As Associate: Mr. F. B. Patch (London).

The Death is announced of Mr. Robert Russell, who was surveyor of the Government of New South Wales of the shores of Port Phillip Bay in 1836, and in the following year assisted in laying out the town of Melbourne. He was ninety-three years of age when he died.

A Bradford Improvement.—The Parks Committee of the Bradford City Council have purchased about 1,500 sq. yds. of land in Bramley Street, at 5s. per sq. yd., as a recreation ground. The space is well paved, drained, and flagged, and will come under similar regulations as other recreation grounds in the city.

Another Open Space for Harrogate.—The Harrogate Corporation have received the sanction of the Local Government Board to a loan of £2,100 for the purchase of land in East Parade at present used as a bill-posting station. It is proposed to keep the site as an open space and to convert it into a miniature pleasure ground.

Street Works and New Buildings at Pembroke, Dublin.—A Local Government Board enquiry has been held into an application by the Pembroke Urban District Council for sanction to loans of £1,400, £10,200, £9,032, and £3,000 for the purpose of constructing street crossings, paving pathways, erecting working-class lodging-houses under the Housing of the Working Classes Acts, erecting a fire department station, and for alterations and additions to the Town Hall.

Local Government Board Enquiry at Bootle.—A Local Government Board enquiry was recently held at Bootle into the application of the Corporation for a provisional order to enable the Town Council to carry out the work of altering the levels of and widening Lineacre Lane, altering the levels of Litherland Road and New Street, widening the corner of Strand Road, and putting in force the powers of the Land Clauses Act in respect to the purchase of land otherwise than by agreement.

Leeds Improvement Schemes.—A Local Government Board Enquiry has been held into the application of the Leeds Corporation to put in force the powers of the Land Clauses Acts with reference to certain properties required for the widening of Cookridge Street, and for the construction of a new street between Albion Place and Briggate. The City Engineer (Mr. Hewson) mentioned at the enquiry that the bottom of Cookridge Street was now 34ft. 5in. wide. They would be able to make it 85ft. wide. They desired to acquire from the Roman Catholic authorities 14,625 sq. yds. of land. What was now used for the improvement would, no doubt, be afterwards sold as surplus land. The width of the proposed new street to Briggate would be 45ft.

Duck's Foot Lane, E.C.—The City Corporation proposes to abolish the name of Duck's Foot Lane, Upper Thames Street, and to incorporate the lane with Laurence Pountney Hill, and an application has been made to the London County Council to sanction this alteration. Duck's Foot Lane is a corruption of Duke's foot-lane, the Duke of Suffolk's private way to the river from his house in Suffolk Lane, the scene of the conversation alleged to have been overheard by the Duke of Buckingham's surveyor, as related in the first act of Henry the Eighth. "The Duke, being at the Rose, within the parish St. Laurence Pountney, did of me demand what was the speech among the Londoners concerning the French journey." The proposed alteration appears to be unnecessary and will obliterate an interesting landmark of ancient London.

New Companies.

Argillite Slab Company, Limited.

This company was registered on April 10th with a capital of £2,000 in £1 shares to carry on the business of marble, stone, slate, brick, timber and hardware merchants, &c.

Steam Ovens and Tile Company, Ltd.

This company was registered on April 9th with a capital of £5,000 in £1 shares with objects as indicated by the title. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers.

Nyewood Brick and Tile Works, Ltd.

This company was registered on April 11th with a capital of £10,000 in £1 shares to acquire and carry on the brick, tile and pottery works at Nyewood, Harting and elsewhere, now owned by H. Hutchinson. The first directors are H. Hutchinson and H. Wade.

Medley Road Syndicate, Limited.

This company was registered on April 14th with a capital of £1,000 in £1 shares to carry on the businesses of builders, contractors, land and property owners, sawyers, joiners, stone merchants, &c. Registered office: 84, Colmore-row, Birmingham.

Wootton Pillinge Brick Co., Limited.

This company was registered on April 10th with a capital of £12,000 in £1 shares to acquire and work brickfields and other property in Bedfordshire or elsewhere. The first directors (to number not less than two nor more than seven) are J. E. Allen and T. C. Moleworth.

North London Cartage Company, Ltd.

This company was registered on April 9th with a capital of £5,000 in £1 shares to acquire certain premises at Belle Isle, York Road, N., to adopt an agreement with A. W. Tooley, and to carry on the business of cartage contractors. The first directors are A. W. Tooley and F. G. Oliver.

Cropley Brothers, Limited.

This company was registered on April 17th with a capital of £3,000 in £1 shares to carry on the business of brick and tile makers, porcelain and earthenware manufacturers, &c. The first directors (to number not less than two nor more than four) are John Cropley, C. Cropley and James Cropley.

Hook Brick and Tile Company, Limited.

This company was registered on April 11th with a capital of £10,000 in £1 shares to adopt an agreement with A. F. Woodwell, and to carry on the business of brick, tile and artificial stone makers, &c. The first directors (to number not less than two nor more than six) are W. Cambden, H. A. Woodwell and A. F. Woodwell.

Birmingham Incandescent Lighting Company, Limited.

This company was registered on April 9th with a capital of £1,000 in £1 shares to manufacture, work, sell, let on hire, and deal in burners, meters, wires, and other gas and electrical accessories and appliances. John Wilson is the permanent managing director, with £150 per annum and 20 per cent. of the net profits. Registered office: 230, Market Place, Dudley.

Isaac Gould, Limited.

This company was registered on April 9th with a capital of £20,000 in £1 shares to acquire the business carried on by Isaac Gould at Hartshead Works, Hunslet, Leeds, and to carry on the business of contractors, brick and tile makers, &c. The first directors (to number not less than five nor more than ten) are W. C. Williams, G. Franklin, A. Barrett, A. Mountain,

H. Season, S. Macfarlane, J. Gordon, Marmaduke Chaplin and I. Gould.

Park Lane Brick and Tile Company, Limited.

This company was registered on April 10th with a capital of £10,000 in £1 shares to acquire the business carried on by J. C. Dean, at the Park Lane Brick, Tile, and Terra-cotta Works, Bryn, near Wigan, Lancashire, and to carry on the business of brick, tile, and pottery makers, stone merchants, &c. The first directors (to number not less than three nor more than seven) are P. Pinnington, J. Morris, D. Houghton, J. Graham and J. Shaw.

Tunstall Coal and Iron Company, Ltd.

This company was registered on March 31st with a capital of £100,000 in £1 shares to carry on the business of coal and iron masters, &c., and generally to carry on in all or any of their respective branches the businesses of engineers, brass, iron, copper, and zinc merchants, builders and contractors, ironmongers, bar fitters, lock and bolt makers, gas engineers and gas fitters, manufacturers of tanks, cisterns, gas fittings, stoves, grates, and all kinds of heating apparatus, &c. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the signatories, Messrs. W. T. Ellison, F. B. Heywood, H. A. Glover, R. B. Cowley, H. Bertin, H. W. Clayson, and J. Baker.

James Latham, Limited.

This company was registered on April 7th with a capital of £80,000 in £10 shares (4,000 preference and 4,000 ordinary) to acquire the business of timber merchants, manufacturers of and dealers in every description of veneers, mouldings, &c., as carried on under the style or firm of James Latham at 124, Curtain Road; Mahtal Wharf, Grove Road, Victoria Park; at 80, Boundary Street, Bethnal Green; and 1, Virginia Road, Bethnal Green; and generally to carry on the businesses of timber and wood merchants, sawmill and moulding mill proprietors, packing-case makers, box manufacturers and dealers, carpenters and joiners, &c. The first directors (of whom there shall be not less than three nor more than five) are J. Latham (permanent managing director and chairman), J. Latham, junr., E. L. Latham (deputy-chairman and assistant manager) and E. Latham.

Walton, Goody and Cripps, Limited.

This company was registered on April 4th with a capital of £225,000 in £10 shares to acquire the businesses of marble quarrymen, &c., as carried on under the style of W. Walton and Nephew, at Carrara and elsewhere in North Italy, the business carried on at 14, Graham Street, Islington, N., and the businesses now carried on at Canon's Marsh, Bristol, and 17 and 19, Parliament Street, Liverpool, and elsewhere, as Goody, Cripps and Sons, Limited; and generally to carry on the businesses of marble quarrymen, manufacturers and merchants, proprietors of sawmills, and other businesses carried on at Carrara and elsewhere in Northern Italy, &c. The first directors (of whom there shall be not less than three nor more than eight) are H. Goody, H. K. Cripps, S. B. Cripps and G. Salvini.

W. F. Stanley and Co., Limited.

This company was registered on April 10th with a capital of £120,000 in £5 shares to acquire the business of manufacturers of and dealers in optical, geodetic, surveying, mathematical, drawing and philosophical instruments of every description, carried on by W. F. Stanley at 4 and 5, Great Turnstile, Holborn; 13, Railway Approach, London Bridge; and 8, Victoria Street, Westminster; and the factories at 10, Great Turnstile, Holborn, and 8 and 9, Tichborne Street, W.C., and the optical works at South Norwood. The first directors (of whom there shall be not less than three nor more than seven) are J. Stanley, W. T. Stanley, G. I. Gray and W. W. Cobbett. Registered office: 4 and 5, Great Turnstile, Holborn.

Keystones.

Mr. R. A. M. Stevenson, the well-known art critic, and cousin of Mr. E. L. Stevenson, died last week.

A new Fountain at Dunoon has been erected within the bandstand of Pier Road. It is of Aberdeen granite with brass mountings.

Public Baths for Leyton, Essex.—The Local Government Board have sanctioned a loan of £25,643 for building public baths at Leyton.

For a Proposed Nurses' Home at Woolwich Workhouse the designs of Mr. C. W. Brooks, of 63, Finsbury Pavement, E.C., have been accepted by the Woolwich Guardians.

Kew Gardens and Old Deer Park.—The Government has decided to erect a large National Physical Laboratory in Old Deer Park, at the side of the Queen's Cottage grounds at Kew. This is regretted by many.

Millais Memorial.—A meeting of the Millais Memorial Committee was held on Saturday, when Mr. Brock's design was adopted. The statue will be placed in the space to the front of the right wing of the Tate Gallery.

Explosion at a Varnish Works.—An explosion occurred last week at the varnish works of Messrs. Mander Bros., of Wolverhampton, when three men were injured. The explosion is supposed to have been caused by the fumes from some boiling oil or varnish becoming ignited.

The "William Dawson" Memorial Chapel, Barwick, Leeds.—This building has been erected from designs by Mr. G. F. Danby, architect, of Leeds, and provides accommodation for 200 persons. The principal contractors were Mr. J. Richardson, of Chapeltown, and Messrs. H. Atkinson and Sons, of Leeds. The total cost has been £3,014.

The Ancient Castle of Chillingham, which is to be let by the Earl of Tankerville, was erected in the reign of Edward the Third, and has characteristic features of all the styles of architecture in vogue during its existence, the modern part, in Renaissance style, having been designed by Inigo Jones. It has a beautifully wooded park of 1,500 acres.

New Church at Harrogate.—A new church, dedicated to St. Mark, is in course of erection in the southern part of Harrogate. A portion of the edifice was opened last year by the Bishop of Ripon for public worship, and the remainder will be proceeded with as funds are received. The additions include a chancel, side chapel, organ chamber, vestries, and tower. When complete the church promises to be a handsome building. The architect is Mr. J. Oldrid Scott.

New Admiralty Buildings.—The second block of the new Admiralty buildings, though fast approaching completion, will probably not be in a condition for occupation for another three months. Externally the building is practically finished. This new block, erected at a cost of about £200,000, will be taken possession of by the Accountant-General of the Admiralty, for whose department it has been specially designed. A third new block is still under consideration. The dome on the summit of the new building is a handsome piece of work, and is seen to great advantage from the Horse Guards Parade.

Discoveries in Babylon.—The German Oriental Society has heard from the director of the Babylonian excavations, Dr. Koldewey, that three gates have been discovered, besides a canal built with Aramean bricks, which is supposed to be the long-sought-for East Canal, so often mentioned in inscriptions. A temple called "Ernach of the Goddess Ninniach" has been laid bare, the stones bearing inscriptions dating from the time of Nebuchadnezzar, and it is worthy of special notice that, though all the excavators' discoveries date from or before the reign of Nebuchadnezzar, yet little or nothing has come to light that can be attributed to the anterior times of Sardanapalus.

Ruskin's Turner Water Colours are to be again exhibited in London at the Fine Art Society's premises.

At the Manchester Corporation Art Gallery the spring exhibition of water colour drawings has been opened.

New Conservative Club at Settle.—The contracts for a new conservative club at Settle, amounting to about £2,300, have been let.

Dedham Bridge.—The old wooden bridge over the Stour at Dedham is about to be pulled down and replaced by a new bridge of less picturesque appearance.

For Erecting a Statue of General Gordon on the pedestal already finished at Khartoum, £2,000 are wanted. The "Morning Post" has opened a subscription list.

A new Conservative Club at Ripponden has been erected at the corner of Royd Lane from the designs of Mr. C. F. L. Horsfall, of Halifax. The total cost will be about £3,500.

Fall of a Wall at Manchester.—In the course of some demolition work at the corner of Port Street and Dale Street, Manchester, three men were injured last week by the fall of a wall.

A Working Men's Club at Gosforth, Newcastle-on-Tyne, has been erected. The building fronts West Avenue, and on the ground floor there is a room capable of accommodating 150 persons.

New Workhouse Infirmary for Retford.—The tender of Mr. C. Jones, of Retford, amounting to £3,292, has been accepted for the erection of a new workhouse infirmary. Messrs. Sanders and Taylor's tender of £300 for hot-water heating, &c., has also been accepted.

The Memorial of the late Dean Vaughan, the Master of the Temple and the Dean of Llandaff, takes the form of a marble statue. It has been executed by Mr. W. Goscombe John, and will be exhibited at the Royal Academy before being removed to Llandaff Cathedral.

Christian Archæological Congress.—The second international congress on Christian archæology began its sittings at Rome on April 17th in the Grand Hall of the Roman Seminary. Cardinal Parocchi delivered a speech in Latin, in which he welcomed the congress and conveyed the best wishes of the Pope for its labours. Mgr. Duchesne, president of the congress, delivered his inaugural address.

A new Mission Church at Ossett is being built in Junction Road. The cost will be about £1,200. The architect, Mr. A. S. Marriott (Messrs. Marriott and Son), has designed a structure entirely of stone on the outside, with ashlar dressings from the Holmfirth quarries; the doors and windows in the front elevation having Tudor heads. The building will measure 50ft. by 22ft., and will be dedicated to St. Aidan. The chancel end can be separated from the rest of the building by a movable screen, leaving a room to be used on week-days as a school, with accommodation for seventy desks. Two classrooms adjoining will seat thirty and thirty-six scholars respectively, and there are other usual accessories.

Alleged Vandalism in Cyprus.—In the Milan "Corriere della Sera," a sarcastic attack appears on the British authorities in Cyprus for the alleged destruction of the ancient Famagusta and other archæological remains in the island. After recalling the outcry made by English lovers of ancient monuments at the restoration of St. Mark's in Venice, the writer asks if those who then protested against what was described as vandalism in Italy are aware that the ancient city of Famagusta is being systematically destroyed in order to provide stones for building at Port Said, and that the old walls of the city with the fort, still surmounted by the lion of St. Mark, are about to be demolished and the material used for a tramway. The writer animadverts upon the difference regarding the fate of the monuments of Hellenic art in Cyprus displayed by the British archæological societies which protest against the removal of similar relics of the past in Greece and other foreign countries.

A new Wesleyan Church at Darlington is being built. It is in the Gothic style and will cost £3,000, exclusive of the organ.

Addition to All Saints' Church, Harworth, Rotherham.—A new chapel of ease has been added to this church. It is dedicated to St. Mark and has been erected by Messrs. Kelsey, of Goole, from the designs of Messrs. Hodgson and Fowler, of Durham.

Dublin Housing: Lord Iveagh's Gift.—A Local Government Board enquiry was recently held into the scheme promoted by Lord Iveagh for providing dwellings for persons of the labouring classes who are to be displaced under the Dublin Improvement (Bull Alley) Act, 1899.

Clerical Definition of a Keystone.—A contemporary prints the following:—"One of our readers sends us a mixed metaphor which he heard the other day in church. The preacher, referring to some special aspect of religion, described it unhesitatingly as 'the keynote of the Christian arch.'"

Memorial to Mr. Gladstone.—Mrs. Drew, wife of the Rev. Harry Drew, vicar of Buckley, Flintshire, and Miss Helen Gladstone have offered to erect a memorial chancel in Buckley Church to their father, the late Mr. W. E. Gladstone, and the parishioners having gratefully accepted, a faculty will be applied for shortly. The cost of the memorial, it is estimated, will be about £1,000.

A new Board School at Chesterfield is being erected at the corner of Ashgate Road and Foljambe Road. Messrs. Tiltman and Jackson are the architects. The school will cost £14,230, exclusive of site and furniture, and accommodation will be provided for 1,191 children. Under the central hall there will be swimming baths, cookery and laundry rooms, and a pupil teachers' centre. The contractors are Messrs. J. C. Kellett and Son, of Leicester.

The New Old Bailey.—A number of architects have forwarded plans for the rebuilding of the Old Bailey Sessions Court, and they will be considered at an early meeting of the Common Council. The present buildings, which were originally reared in 1773 and enlarged in 1808, are altogether too small, inconvenient, and ill-ventilated to suit present-day requirements. The proposal to demolish them and raise a new court-house was first made rather more than thirty years ago, since when the matter has cropped up on many occasions.

Scottish Building Trades' Federation.—The half-yearly meeting of the Scottish Building Trades' Federation was held at Aberdeen on Thursday last, when the chair was occupied by Mr. Alexander Beveridge, builder, of Perth, in the absence through indisposition of the president, Mr. Thomas Kay, of Glasgow. Members were present from all parts of the country. The secretary, Mr. James L. Selkirk, C.A., of Glasgow, read the report, which referred in detail to the principal matters that had been under consideration during the six months. The first of these was the question of organisation; a scheme for the appointment of a consultative committee was proposed and adopted. The committee will consist of six gentlemen from each of the four principal cities—Glasgow, Edinburgh, Dundee and Aberdeen—twenty-four in all—representing the different trades, whose duty it will be to meet from time to time to consider what steps are necessary in order to further the objects of the Federation, with special reference to wages and other conditions of labour. It was remitted to the Executive Committee to carry out the resolution. Reference was made in the report to trade disputes, and a strong opinion was expressed as to the by-laws being operative for three months instead of six—the three-monthly arrangement being already in satisfactory operation in Dundee and other places. The next annual meeting was appointed to be held in Edinburgh in October next. The next quarterly meeting of the executive will be held in Perth in July, when reports will be given in by the consultative committee.

Masters and Men.

Dumfermline Painters' Strike.—The employers have agreed to give the advance of wages from 8d. to 8½d. struck for, but with the proviso that future agreements should terminate at the end of December each year, and that any alteration of rules should come into force on the first of February of each year if mutually agreed to.

Masons' Strike at Kilbirnie and Beith.—The master builders of Kilbirnie, in conjunction with those at Beith, having given notice to the men that they would reduce the wages on the 23rd inst., the Beith men left off work last Saturday week and the Kilbirnie men last Monday week. The employers wish to reduce the rate from 9d. to 8d. per hour.

Disputes at Glasgow.—The strike of joiners that took place last week has been settled by the masters withdrawing their proposal to reduce the wages by 1d. per hour, and agreeing to continue the present wage of 10d.—The master masons have also intimated to their workmen a reduction of a half-penny per hour in wages. The men have decided to adhere to the standard wage of 9½d.

The Dundee Masons' Strike has come to an end, the men agreeing to return to work on condition that no reduction of wages should take place until May 15th; that wages should then be reduced by ½d., and remain stationary for six months; that no further reduction or advance should take effect unless after three months' notice on either side; and that there should be no victimising of individuals on either side for the part they had taken in the dispute.

Labour Disputes at Tamworth.—The application of the bricklayers' labourers for an advance of ½d. per hour has been referred to arbitration, and pending the result the men will remain at work.—The master painters have again offered to consider the application of the workmen for an advance of ½d. favourably next year if the men will return to work on the old terms. This offer has been rejected by the men, who have expressed their willingness to submit the dispute to arbitration. The masters' reply to this proposal has not yet transpired.

Disputes in Edinburgh and Leith.—The master joiners proposed to reduce the men's wages from 9½d. to 8½d. per hour, but have agreed to a compromise making the wage 9d. A strike, however, took place last week upon the question of when alterations in wages or any of the working rules should come into force. The master builders proposed that at the beginning of June—at which date the present arrangement comes to an end—a reduction in wages should take place. At present the operative masons are in receipt of 9½d. per hour, with ½d. extra in cases where there is no shed shelter, and the proposal of the employers was that the wage should be reduced to 9d. per hour, the reduction to take effect in three months. Along with this proposal was one that the yearly agreements which at present exist between masters and men should terminate, and that henceforth any agreements as regards wages, rules, &c., should last for only three months. The men decided to resist the proposals of the masters both as regards reduction of wages and the termination of the annual agreement system, and, if necessary, to come out on strike at the beginning of June in the event of the employers insisting upon their proposed terms. There are about 2,000 joiners in Edinburgh and district, but by the action of the conceding firms 700 men have been freed from participation in this trouble. The masters agreed eventually to allow the men's terms.—A largely-attended meeting of Edinburgh and Leith masons last Wednesday received an intimation from the masters that on the termination of the existing agreement on 5th June a reduction of wages would take place from 9½d. to 8½d. per hour. By 298 votes to 48 the men resolved to adhere to the present arrangement, and they also resolved against a proposal by the employers to substitute a quarterly for an annual agreement.

Trade and Craft.

Private Electric Lighting.

It is a great pity that the proper illumination of homes is commonly neglected. The building may be an architectural perfection outside, the interior may be adorned with valuable pictures and statues, but unless the illumination receives proper consideration the whole internal effect will be marred. As a useful, handy and economical illuminant, the electric light has for many years been gaining in favour, both when supplied from public and private sources. With regard to the latter, we now wish to refer to the Westinghouse gas engine, which can be operated by gasoline, so that the owner becomes independent of coal and gas. One of the great advantages of electric lamps, with their shades or ornamental glass, is that they can be clustered in any manner to give the most artistic effects, and are readily fixed in any nook or corner, which is not possible with gas. Above all, electricity is a safe means of lighting, a most important consideration for owners of country and suburban places far distant from fire stations. As regards economy, a gas or gasoline engine involves a much smaller expense for fuel than a steam plant, and one man of ordinary intelligence and mechanical experience can operate the whole installation. The serious problem in the past in providing electric light for country houses and other isolated buildings has been an economical and mechanically satisfactory means of driving the dynamo. This problem the Westinghouse Company, of Westinghouse Buildings, Norfolk Street, Strand, W.C., now claims to have solved, and they contend that theirs is the only gas engine which can be direct-connected to a dynamo and give an absolutely steady light. Whenever floor space has to be economised, the Westinghouse direct-connected outfit is most suitable, and it requires far less space than where a belt is used. A Westinghouse gas or gasoline engine and dynamo can be applied to many useful and labour-saving purposes, for not only will it afford the illumination, but it can be used for elevator service, driving sewing machines, ventilating fans, pumps, lathes, sawing, preparing fodder, and driving ice freezers, dairy and laundry appliances. The current may also be utilised for cooking and warming the house. All these and many other forms of work are possible. Mr. George F. Gould's plant at Lakewood, N.Y. (an illustration of

WESTINGHOUSE GAS ENGINE GENERATING SET, NO. 909.

which is seen on this page), consists of one 85 horse-power and one 28 horse-power Westinghouse gasoline engine placed in a detached building, each of the engines being direct-connected to a Westinghouse "Engine Type" dynamo. The electric current provides light for the house and grounds, power for a refrigerating plant, and for pumping water to the house and stables. Electricity also operates the laundry, and is used for other purposes. The charming summer hotel known as the "Kirkwood Inn," at Scarborough Beach, Maine, is lighted by electricity generated by a Westinghouse plant, which affords one of the best illustrations of the advantages of Westinghouse practice. A 30 horse-power Westinghouse gas engine is connected to a generator, and also to a "triplex" pump. The generator furnishes light to the hotel and grounds, and the pump supplies all water required on the premises. This plant was installed in the spring of 1893, and its successful and economical operation, its freedom from noise and odour, have led to the installation of similar plants in various parts of the country. The installation at the residence of Miss E. J. Clark, Pomfret, Conn., which consists of a 30-horse power Westinghouse gasoline "Engine Type" dynamo, illustrates the great utility of the gasoline engine, for no coal gas could be obtained on the estate, and the introduction of a steam plant, with boilers requiring coal, and the accompanying smoke, dirt, and ashes would not have been considered for a moment. Enough has been said to show the economical qualities of the Westinghouse plant, qualities which are important enough to receive a first consideration.

INTERIOR OF MR. GEORGE GOULD'S POWER HOUSE, SHOWING WESTINGHOUSE PLANT.

ARCHITECTURE

AT THE

ROYAL ACADEMY,

1900.

THE demand in former years for the series of Special Supplements dealing with Architecture at the Royal Academy, has shown the Proprietors of the "ARCHITECTURAL REVIEW" that there is a desire to preserve in permanent form a record of current architecture and design.

The pre-eminent position of the "ARCHITECTURAL REVIEW" has enabled the Editor to secure the right of reproducing all the Architectural drawings exhibited at this year's Academy. Nearly 400 photographs of the best designs have been secured, and a list of some of the leading Architects whose designs will appear, is given below.

Instead of publishing, as formerly, special supplements in succeeding monthly issues, the whole of the May issue of the "ARCHITECTURAL REVIEW" will be devoted to Academy Architecture, and this issue, which will be largely increased in size, will form the most complete and permanent record of current architecture and design.

LIST OF ARCHITECTS AND CRAFTSMEN WHOSE DRAWINGS WILL APPEAR IN THE SPECIAL MAY ISSUE.

CONTRACTS OPEN.

CITY of WINCHESTER. TO BUILDERS.

The Corporation of the City of Winchester invite TENDERS for the ERECTION of PUBLIC BATHS, consisting of Swimming Bath, Slipper Baths, and Turkish Baths, on land facing North Walls and Lower Brook-street, Winchester.

The drawings, specification, and conditions of contract can be inspected between the hours of TEN a.m. and FOUR p.m. (Saturdays until One p.m.), on application either to the Town Clerk, at the Guildhall, Winchester, or to the Architects, Messrs. LANSDALE and HARRISON, 38, Bow-lane, Cheapside, London, E.C., from either of whom bills of quantities and forms of Tender can be obtained, upon depositing the sum of £5, which will be returned to the depositor upon receipt of a bona-fide Tender.

Tenders (upon the printed form) must be signed, enclosed in a sealed envelope, and endorsed "Tender for Public Baths," and addressed to the undersigned and delivered at the Guildhall, Winchester, not later than TWELVE o'clock noon, on FRIDAY, APRIL 27th.

The builder whose Tender is accepted will be required to enter into a bond with two sufficient sureties for the due performance of the contract.

The Corporation do not bind themselves to accept the lowest or any Tender.

WALTER BAILEY,
Town Clerk.

Guildhall, Winchester.
April, 1900.

COMPETITION.

BERKHAMPTSD GIRLS' GRAMMAR SCHOOL BUILDINGS' ASSOCIATION. TO ARCHITECTS.

The Board of Management invite COMPETITIVE PLANS for the ERECTION of a SCHOOL to accommodate 150 girls.

Premiums of £50, £35, and £15 will be awarded to the authors of the Designs placed first, second, and third respectively, and in the event of the selected Design being carried out, the premium will merge into the commission.

The President of the Royal Institute of British Architects will be asked to appoint an Assessor to advise upon the design. A copy of the conditions and instructions, together with site plan, may be obtained upon application to A. W. VAISEY, Solicitor, Berkhamsted, the Secretary to the Association, to whom the drawings must be delivered under cover not later than JUNE 16th, 1900.

Berkhamsted,
April, 1900.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BLACKBURN.—For the erection of shop and house, Eldon-street, for the Blakey Moor Co-operative Society. Messrs. Simpson and Duckworth, architects, Richmond-chambers, Blackburn:—
R. Hatton ... £1,151 15 6
R. Webster ... 1,139 0 0
Ginger & Cooper ... 1,124 6 8
Willson and Sons ... 1,109 0 0
Jas. Parker ... 1,078 0 0
Lewis and Sons ... 1,065 0 0
Jas. Holden ... £1,035 0 0
W. J. W. Cronshaw ... 1,028 0 0
J. Gill brand, Blackburn* ... 1,020 0 0
* Accepted.

CREDITON (Devon).—For the choir stalls in oak for the church of the Holy Cross, Crediton, Devon. Messrs. Tait and Harvey, Fellows R.I.B.A., architects, Exeter:—
W. Berry ... £350
W. Dart ... 350
T. Norbett ... 335
Harry Hems and Sons, Exeter ... £320

HUNSLLET.—For the erection of the proposed new work-house, for the Hunsllet Board of Guardians:—
Joseph Howe and Co. ... £63,923 17 11
John R. Stott, Sunderland ... 63,986 18 0
Sam Warburton, Miles Platting ... 63,870 0 0
George Oakes and Co. Hunsllet ... 63,799 4 4
W. Storrs, Sons, and Co., Ltd., Staley-bridge ... 62,639 10 0
J. E. Johnson and Son, Leicester ... 62,201 0 0
Walker and Slater, Derby ... 61,930 0 0
W. Nicholson and Son, Leeds ... 61,496 0 0
Harold Arnold and Son, Doncaster* ... 59,490 0 0
* Accepted, with £1,656 extra for Westmorland slates, making a total of £61,026.

LONDON.—For the Children's Receiving Home at Tremar-gardens, for the Guardians of the Poor of Paddington. Mr. J. Wallis Chapman, architect, 11, Sutherland-avenue, W.:—
J. O. Richardson ... £5,536
Barrett and Power ... 5,379
Kingerlee and Sons ... 5,379
Sniffin Bros. and Co. ... 5,316
Falkner and Son ... 5,255
John Appleby ... 5,244
Holliday & Greenwood ... 5,154
Godson and Sons ... £5,145
F. and H. F. Higgs ... 4,973
W. Gibson ... 4,918
B. E. Nightingale, Albert Embankment ... 4,793

LONDON.—For putting in foundations up to damp course of St. Thomas's Church, Telford Park, Sreatham Hill, for the Vicar and building committee. Messrs. Sidney R. J. Smith, 14, York-buildings, Adelphi, and Spencer W. Grant, 63, Finsbury-pavement, E.C., joint architects. Quantities by Mr. Money Marsland, 68, Great Tower-street, E.C.:—
Contract No. 1.
G. H. & A. Bywaters ... £2,354
and Sons ... 2,591
A. Porter ... 2,525
F. G. Minner* ... 2,070
Contract No. 2.
For the erection of part of the superstructure.
F. and H. F. Higgs ... £2,343
Holloway Bros. ... 8,575
A. Porter ... 8,449
Higgs and Hill ... 8,334
Higgs and Hill ... £2,354
Candler and Sons ... 2,195
Smith and Sons ... 7,945
Gregory and Co. ... 7,845
F. G. Minner ... 7,800
* Accepted.

LONDON.—For erecting two pairs semi-detached villas, Clapham Common, S.W. Mr. Herbert Bignold, architect, 212, Lavender Hill, S.W.:—
Heather ... £2,200
Jewell ... 3,714
Jenkins ... 2,880
Dickson ... £2,750
Cane accepted ... 2,730

LONDON.—For the erection of St. John's Institute, Larcom-street, Walworth, S.E.:—
Higgs and Hill ... £5,995
Lorraine and Sons ... 5,854
Holloway Bros. ... 5,738
William Shepherd ... 5,700
Edwards and Medway £5, 95
Johnson and Co. ... 5,569
Holliday & Greenwood 5,449
John Marsland* ... 5,415
* Accepted.

LONDON.—For erecting the first block of new Works Depot at Brompton Green, for the Vestry of St. Matthew. Mr. R. Stephen Ayling, architect, 19, Old Queen-street, Westminster:—
Perry Bros. ... £2,587
Jarvis and Son ... 2,797
Johnson and Co. ... 2,790
Sheffield Bros. ... 2,777
Ashby Bros. ... 2,748
G. E. Todd ... 2,720
F. and F. J. Wood ... 2,683
Chessum and Sons ... £2,679
Harris and Wardrop ... 2,637
Thomerson and Son ... 2,578
W. Gladding ... 2,512
Gough and Co. ... 2,484
Joseph Hay ton* ... 2,169
* Accepted.

LUTON.—For the erection of a highway depot, &c., St. Mary's-road, for the Town Council. Mr. A. J. L. Evans, borough engineer, Town Hall, Luton:—
Miskin and Sons ... £5,817
S. Redhouse ... 4,911
T. and E. Neville ... 4,811
G. Smart ... £4,848
W. G. Dunham, Luton* ... 4,693
* Accepted.

MAESTEG (Wales).—For the erection of school's, &c., Caerfan, for the School Board. Mr. E. W. Burnett, architect, Tondu, near Bridgend:—
W. McGaul ... £2,893
P. Gaylard ... 2,820
W. Francis ... 2,791
J. Battary ... £2,493
E. Evans, Maesteg* ... 2,398
* Accepted.

MORTLAKE.—For the erection of forty-two workmen's dwellings, South Worpole Way, for the Urban District Council of Barnes. Mr. G. Bruce Tones, C.E., High-street, Mortlake:—
B. E. Nightingale ... £13,285 0 0
Lorden & Sons ... 12,883 0 0
F. Tingley ... 12,867 2 5
W. S. Beaton ... 12,511 8 1
Soole and Sons ... 12,100 0 0
A. H. Harris ... 11,800 0 0
C. R. Gurr ... 10,530 0 0
S. Dockerill ... £10,496 0 0
J. Wilford ... 10,300 0 0
D. Pitt, Holly Lodge, Mortlake* ... 9,947 0 0
G. W. F. Bates ... 9,854 18 7
Jones Bros. ... 9,833 11 7
* Accepted.

SPEKE (near Garston, Lancashire).—For the construction of a river wall, for the trustees of the late Richard Watt, of Speke Hall, Messrs. Charles H. Beloe and Frank E. Priest, M.M.Inst.C.E., engineers. Quantities supplied:—
John Taylor, Garston, Runcorn stone ... £3,000 0 0
Speke stone ... 3,700 0 0
Charles Burt, Liverpool, Runcorn stone ... 2,950 0 0
Speke stone ... 3,000 0 0
Elwy Williams, Rhyl, stone to be quarried by trustees ... 3,584 6 6
Holme and King, Liverpool, Runcorn stone* ... 2,359 7 11
* Accepted.

WORKING.—For the erection of bottling stores and stabling, for Messrs. H. and G. Simonds, Ltd., of the Brewery, Reading. Mr. William G. Jones, architect, Woking:—
J. Whitburn ... £1,625
J. Harris and Son ... 1,773
G. Allard* ... 1,685
Drowley and Co. ... £1,606
* Accepted provisionally.

MORRISON & INGRAM'S SANITARY APPLIANCES.

SIZES: Basin, 27in. by 19in. Bowl, 18in. by 13in.

THE new pattern of Lavatory Range here shown is made in strong fire-clay, highly glazed in white. It includes H. & C. taps and quick waste, patent clear way accessible overflow, 1½in. clear-way brass trap, cast-iron, porcelain enamelled waste pipe, and supporting brackets.

Price 74s. per person.

If without brass trap and interior of waste pipe not porcelain enamelled,

Price 64s. per person.

An Architectural Causerie.

Woes of a Picture Hanger.

THE ordinary visitor to a picture show has no conception of the thankless and exhausting labours of the committees of selection, and of those on whom the duty of hanging the selected pictures falls. It is to enlighten the public upon some of the difficulties which these bodies encounter that this little article is written, thrown into narrative form, but not describing anything which actually happened in the way described; and it will be of special interest in view of next week's opening of the Academy. There were four of us on the Hanging Committee, and we had been selected with the intention of giving as catholic a flavour to the Exhibition as possible. One was a Decadent, one a High Art man, one a "Market Produce" man—by which I mean one of those sane painters who consider first whether a subject is likely to be saleable when an idea occurs to them, and if they decide that it is not, throw it aside in favour of another which does not please them quite so much but which is less likely to be left on their hands—and as all these were figure painters, a landscapist was thrown in, just "to keep the balance true."

The Committee of Selection was quite another body, with whose proceedings we had nothing to do. Our duty was to make the best of what they passed on to us. We were turned loose one morning into rooms stacked with pictures with their faces to the walls, and with a number of carpenters under our orders, who were to handle the pictures and whom we had to keep supplied with work. The first thing, of course, was to turn the big pictures face outwards and settle which should form centres around which to group other less important works, and now our troubles began. The Decadent immediately fixed on an empty-looking canvas covered with crude colour, much of which was laid on with the palette knife, and purporting to represent the interior of a *café chantant*. When it was objected that the colour was crude, coarse, and unfeeling, he said it "sang." When the subject was voted unpleasant by the rest of us he shrugged his shoulders and expressed his contempt for "subject," but maintained that we were not likely to find another work so individual. We rather hoped not, if that was what the word meant. Meanwhile the Landscape man lugged out a canvas which was nearly as black as night, and swore it would give distinction to the Exhibition if hung in the best place, and called on us to admire its sobriety of colour and excellent and impressive tone. And the Market Produce man dug out a large picture of two children and some puppies which he said was certain to sell, "and, mind you, that's a thing we ought to think of, because of the commission the Society will get, and one picture marked 'sold' often helps to sell others." The High Art man all this time was looking round with a dissatisfied air, as if there was nothing visible which met with his full approval, until a large picture was turned

round which was all blue and green and had some dubious forms silhouetted against a lighter ground, the outlines of the various patches of colour being well defined and everything treated flatly. This he pounced upon at once, and said with decision: "This picture will be the making of the Exhibition. Let us put it in the middle of the wall over there." The secretary now approached us with a deferential air, and suggested that

stimuli from the carpenters) where the big pictures should go, until at last the Market Produce man, who was, perhaps, the most practical of us, said: "Look here, you fellows, there isn't the least chance of our agreeing yet; let's go to lunch, and afterwards divide the rooms among us, and go on each one alone." But it was objected that there were only three rooms and there were four of us. "Well, then," he said, "let's divide

THE CENTRAL TOWER, COUTANCES CATHEDRAL. DRAWN BY J. A. WOORE.

the carpenters were wasting their time while we were discussing, and could: we give them something to go on with? So we all turned round on him at once, and said in chorus: "Let them get these four pictures ready, and put them up for us to look at"; and for the rest of the morning we discussed, and tried to decide (under occasional

the big room into two, and let the Decadent and the High Art man each do half of it. And then we can revise each other's work, and pull the Exhibition together at the end." And then we went to lunch. This arrangement saved time by economising the opportunities for disputes, which now generally occurred over the demand for

carpenters—but the progress made was rather slow. The High Art man got along rather faster than the others, because he had more idea of what pictures would look like when hung together, and how they would affect each other; and every now and then, too, the other men would miss a favourite picture and discover it in a prominent place in his room! which he explained by saying that everything which had any decorative quality in it had a natural affinity for his room, and necessarily gravitated towards it; and then there were ructions! But he had time to spare every now and then, which he utilised for standing behind the others and giving them good advice, and then there were ructions again. The Market Produce man, being, as I have said, on the whole the most reasonable of the four, took his remarks in good part, and sometimes even acted upon them, and thus discovered that a yellow-green landscape and a blue-green figure did not mutually improve each other, and that scarlet and purple was not a combination quite satisfying to the eye. This was a thing which the Decadent could not be brought to see, and every time the High Art man stood behind him, with his hands on his hips and a quizzical look in his eye, he began to snort and stamp about even if he didn't open his lips. When he began to give good advice the room suddenly became darker, and a bluish tint obscured the colour of the pictures near. On the other hand the Landscape man treated him with the loftiest contempt, and assured him that he knew nothing about atmosphere and natural effect, and advised him to confine himself to "Arrangements," and "Nocturnes," and "Symphonies," and the like.

It was scarcely to be expected that there should be much "unity" about an Exhibition hung in this way, although there was plenty of variety. But the High Art man became very uneasy, particularly over the big room (with which he had nothing to do!), and was observed to be frequently holding consultations with the Market Produce man. One morning, when the other two arrived to complete their labours, they started back in surprise. Had there been a hurricane in the night, which had shifted the pictures from their places? Or had they somehow strayed into an unfamiliar gallery? It was true that they seemed to recognise some of the pictures, but others looked quite strange, being hung so differently. The larger works had been regrouped, and some of the most impossible combinations of colour had been put away into inconspicuous places, while in every case the effect of a picture upon its neighbours had been thought of, so that they improved each other. Their first feeling was bewilderment—the next, anger at the presumptuous mortals who had dared to interfere with their cherished arrangements. And then there was half an hour's heated discussion, after which the Landscape man was brought to see that there had been some improvement effected, and the Decadent, being outvoted, had to succumb.

It may be thought that our troubles were now pretty well over? Not at all. The Selecting Committee, which was of quite a varied a complexion as the Hanging Committee, came again on the scene to revise what we had done, and long and fierce were the discussions that ensued. The Hanging Committee, having arrived at a compromise which was accepted by them all, fought tooth and nail for everything which had been done by anyone of them, while the Selecting Committee, having forgotten how difficult a matter it is to satisfactorily hang a number of pictures brought together by chance, looked at the matter rather from a purist point of view, each individual member having in his mind what he thought to be the absolute best, and practically ignoring that Spirit of Compromise.—JUDGE.

On Reflection.

The Ottawa Fire. THE terrible calamity which has befallen the Canadian capital has sent a thrill of sympathy throughout the English speaking world. The destruction of 3,600 buildings, rendering thousands of people homeless, and entailing a loss of property estimated at three and a half millions sterling—besides the even more lamentable loss of life—mark the conflagration as one of the most extensive and destructive of which we have any record. The first impulse of all humane persons at such times of calamity is to adopt at once such means as may be possible to alleviate the distress that has been caused. But when this first duty has been discharged there will be two questions to be asked and answered. The first is: How is it that, with all the skill and study that has been devoted in recent years to the work of fire prevention and fire extinction, it should be possible for such a calamity to overtake one of the most progressive communities in the Empire? The second question is: What measures can be taken to make the recurrence of such a calamity virtually impossible, not only in Ottawa, but in every city in the world? As regards the first question, the character of the quarter in which the fire originated would sufficiently explain its development without any need to suggest the work of Fenian incendiaries. Given a dense agglomeration of wooden dwellings, huge timber stacks, and manufactories using combustible materials a hurricane and any of the hundred and one accidents from which small fires originate every day, and we have all the elements of a very serious disaster. The second question admits of many answers. One thing is quite obvious; when the devastated area comes to be rebuilt the new buildings must be subject to stringent regulations as regards materials and methods of construction.

Local Authorities and Fire Prevention.

THE safety of a city from fire depends in no small degree upon the energy and forethought of its governing body. Many local authorities (notably the London County Council) exercise the most careful control with a view to preventing the loss of life and property by fire, but others are too much inclined to leave things to chance, regarding the provision of a fairly efficient fire brigade as the beginning and end of their duty. There have just been published by the British Fire Prevention Committee two volumes (the second and third volumes of the Committee's transactions) which should be carefully studied by all who are interested in methods of fire prevention. These volumes contain a great deal of information on the fire-resisting qualities of various forms of building construction, including ordinary methods and those which claim "fireproof" qualities. The information is thoroughly reliable, being based upon scientific tests carried out by the Committee at its testing station, and it is almost superfluous to point out the extreme value, from the point of view of fire prevention, of the mass of facts that have been collated. In view of the Ottawa fire, a paper of very special interest is that in which Mr. Charles E. Goad reviews the history of the greatest fires of the past ten years, pointing out their causes, and showing by diagrams the progress and extent of the fires. This paper is full of suggestiveness, and the hints and warnings it contains would—if universally regarded—go far towards making such vast conflagrations impossible. The pity of it is that men will not take warning until calamity has come very close to their own door. Chicago is built on sound lines as regards fire prevention, because thirty years ago

Chicago was almost entirely destroyed by fire. Ottawa, we doubt not, will be rebuilt on the most approved principles, now that it has had such startling evidence of the dangers of wooden buildings. But there are many other towns where measures for the prevention of fire seem to be almost entirely overlooked. It is a poor policy to wait until the steed is stolen before shutting the stable door.

The Paris Disaster. ANOTHER warning—and a very sad one—of the danger which may result from slipshod or careless work on the part of architects, builders, or engineers, reaches us from Paris. At the time of writing the exact causes of the collapse of the footbridge at the Exhibition last Sunday, with the disastrous loss of life resulting from it, are involved in some uncertainty. The bridge was a temporary one constructed of wood, iron, and concrete; whether there was anything defective in its construction does not appear, but it seems certain that the work had not been properly completed at the time of the accident. The shores supporting the structure are stated to have been prematurely removed in opposition to the advice of the chief architect. It is further stated that M. Picard, the director-general of the exhibition, who examined the bridge the very morning of the disaster, gave orders that no one was to be allowed on it, as he did not consider it safe; yet, notwithstanding this prohibition, one report states that the bridge was crowded at the time of the disaster, and it is certain that no precautions were taken to prevent people passing underneath. If these statements can be substantiated there has been something not far removed from criminal negligence on the part of those who, in the mad rush to get the Exhibition ready at or near the appointed time, disregarded the most obvious precautions for securing the safety of the public. The report that the Prefect of Police had been inspecting certain buildings of doubtful solidity, and had ordered one of them to be closed, seems to indicate that no proper survey of the Exhibition had been made before it was thrown open to the public. It should be obvious that a structure to be used by thousands of people, though only for the shortest time, needs to be subjected to as stringent tests as if it were designed to last for centuries.

Trade Agitators. THE paid agitator is the person who is responsible for a good many of the strikes that are now becoming a regular feature in the trade programme. The ball is set rolling by him, sometimes in a bad cause, and sometimes in a good one. But, putting aside the merits and demerits of trade unionism, one cannot but deplore that there should so often be this discord between master and workman, this feud which must and does injure the work in which both are interested. What are the general labour relations to-day? Simply those which form a basis of agreement for so much money to be given for so many hours' work. The quality of the work itself receives only slight consideration. Who is to blame? Both the master, for not trying to raise the level of the work that is done for him, and the workman, for caring about nothing but wages and hours. And this is one reason why modern handicraft is so degenerate. What is wanted is a higher standard to be set up, and in this connection the paid agitator, who now so zealously pleads the cause of the monetary and physical, might very well be supported by an equally zealous advocate of the ethical. It is well that working conditions should be improved, but it is also well that the standard of the work itself should be raised, though at the present day the former consideration is pushed so much to the front that the latter has only the smallest chance of success.

BUILDING IN THE WEST INDIES *

By JOHN T. REA, F.S.I.,
SURVEYOR, WAR DEPARTMENT.

AS one who has spent four years in the West Indies as a Government official, the writer has thought that a short account of building and architecture in those islands would be interesting and uncommon to the members of the profession in this country. A century and a half ago the West Indies were thought to be of the greatest value to Great Britain, and the history of these sunny islands is nothing but a succession of fierce fights by sea and land. In those days sugar was king, and planters were prosperous and wealthy, and, imitating the merchant princes at home, they erected splendid houses for themselves on their country estates. But all this has changed and foreign subsidies on beet-root have ruined these island colonies, so that building opera-

wildernesses of mighty peaks, intersected by valleys, ravines and rivers, the hills and land being densely clothed with forest and bush. Barbados and Antigua, on the other hand, are almost flat, and afford ample building ground.

Geology.—It is supposed that the West Indies were formerly a part of the continents of North and South America, which extended at a remote period towards the south-east and north-east respectively. They are nearly all of volcanic origin, as the ever-active sulphur springs attest. The rocks are igneous, and are either crystalline, in which case they exhibit much variety of structure; or uncrystalline, composed of volcanic ashes, constituting tufas. Of the former many resemble basalt and greenstone, whilst some are an approach to granite or syenite. These rocks are Tertiary or Post-Tertiary. Barbados and Antigua are of coral formation, resting on a volcanic base. This coral stone is so soft that it can be cut with a hand saw, but hardens on exposure. The building stones are therefore limited in character.

Hurricanes.—Hurricanes form one of the principal factors against which special precautions must be taken in the erection of buildings. They are an extraordinary phenomenon in the West Indies, and it is computed that more than 130 have taken place since the days of Columbus. Their violence is usually confined to the months of August, September, and October. No less than twenty-two have desolated Barbados, and that of August, 1831, was especially remarkable. Buildings were lifted from their foundations and hurled across the streets. A lump of lead, weighing 400lbs., was lifted by the wind and carried 560yds.; and heavy guns were dismantled and shifted great distances. St. Lucia has been laid waste by six hurricanes, and in that of October, 1817, Government House was blown down and the Governor killed. In St. Kitts in 1871, an ox was cut in two by a sheet of iron blown from a roof many yards distant, and in St. Vincent a year ago several people were beheaded from the same cause, and 30,000 rendered homeless. The velocity

CASTRIES, ST. LUCIA.

tions on any respectable scale have now stopped, except in the islands of Jamaica and St. Lucia, where the War Department is erecting large barracks. The writer was stationed in the latter place, but during his stay abroad he visited Barbados, Martinique, Dominica, Antigua, Nevis, St. Kitts, and other islands, so that his observations have been fairly extended. The differences between home and West Indian practice are mainly due to the causes set forth under the following half-a-dozen paragraphs, the rest of the paper being a description of the buildings themselves and of the materials used in their construction.

Nature of Country.

Hurricanes.

Geology.

Earthquakes.

Rainfall and Landslips. Climatic Influences.

Nature of Country.—The nature of the country in most of the islands is very hilly, rendering transit of materials most difficult and making the selection of the site an extremely hard task. This is particularly the case in the more mountainous islands, such as St. Lucia and Dominica, which are simply

Rainfall and Landslips.—Owing to the mountainous and wooded nature of the land, the rainfall is very heavy, being on an average 90in. to 100in. per annum. When we compare this downpour with the average 32in. of the United Kingdom it will be seen that some extra provision must be made in buildings to meet this excessive discharge, and to lead off the rain quickly, which falls in sudden torrents out of a clear sky, choking the gutters and downpipes.

Because of the undermining action of this superabundant rain-water and the steep slopes of the clay-covered hills, landslips are of almost every-day occurrence, and are sometimes of alarming dimensions, destroying roads, carrying away houses, trees, and boulders, and materially altering the general aspect of a district. Great care must therefore be taken in selecting sites for buildings, especially as there is scarcely a level plot of ground to be had and the slopes are sometimes so great that while the doorstep is flush with the road in front a complete basement may be formed beneath, which can be economically utilised for such accessories as lavatories, bathrooms, storerooms, &c.

of the wind was estimated at 105 miles per hour. In the West Indies hurricanes seem to take place in cycles of four years. The author was one of a Government Committee appointed to enquire into the damage done in St. Lucia by the hurricane of 1898.

The experience of the Barbadians has taught them to construct their houses with deep foundations, and with cellars, where the inmates can take refuge. A good protection is a thick hedge of bamboos on the windward side, which breaks the force of the tempest, and partially diverts it. Long rows of quick-growing trees may also be planted. Generally speaking, a well-built house has less to fear from a hurricane than from earthquakes, which we shall next consider.

Earthquakes.—On account of their volcanic origin, almost every island possesses some sort of a crater, and hence they are subject to terrestrial eruptions of more or less violence. A terrible earthquake demolished Port Royal, Jamaica, in June, 1692, and St. Vincent was the scene of a terrific volcanic explosion in April, 1812. Eruptions also occurred in Guadeloupe, and in February, 1843, the capital was engulfed. This city has passed through

* A paper read before the Architectural Association of Ireland on February 6th, 1900.

STREET IN CASTRIES, ST. LUCIA.

so many vicissitudes in the form of hurricanes, earthquakes and fires, that the bewildered residents have now adopted a system of construction with strong iron frames filled in with brick or composition; but it has not yet been put to the test.

It is a notable coincidence that in the West Indies the ground is severely shaken during hurricanes. Thus, shocks, not unlike those of earthquakes, have occurred during the hurricanes in Martinique, Barbados, Havannah, and Guadeloupe, thereby creating a double source of danger to erections of every sort. Structures of wood undoubtedly resist earthquakes better than those of brick or stone, and most of the houses are of this material. The following are useful hints on construction in earthquake countries:—Marshy, wet ground, which is popularly supposed to absorb earthquake motion, is notably a bad foundation, and low soft ground suffers very much more disturbance than the hard, solid places. Steep slopes are also bad situations. Buildings should be founded on the firmest sites, which, if soft, may be consolidated by piling, or by a thick bed of concrete. A platform of masonry or concrete may also be formed, which must extend beyond the base of the house. Foundations should be made continuous. Another method is to give the building free foundations, resting on rollers or balls. Cellars and basements are admissible, and in these vaulting is allowable; but for storeys above ground arched construction should be suppressed because of its outward thrust. Thus vaulted cathedrals and churches have often been overthrown while other houses were saved.

Roof trusses ought to be light and rigid, with a low pitch, and resting freely upon their supports, as it is their thrusting action which tends to overthrow walls when a shock takes place. Walls should be long, thick, and low, and well tied together by means of cross walls and partitions, while the outside corners should be well united; the foundations should be deep, and the upper portion light. Hence the system of building with an upper storey of wood resting on, and not built into, the supporting wall, and a light roof, produces good results. It is on this principle that Government House in St. Lucia is built, its superstructure being a comparatively light framework of timber.

Masonry should be built in lias lime, which has the valuable property of resetting in any slight damp, so that when a building is fissured by earthquake the cracks will speedily close again and still be of a yielding nature. Caverns, wells, and quarries retard the disturb-

ance of the earth, and protect works in their neighbourhood.

Climatic Influences.—For a long time past it has been a matter of notoriety that the West Indies and yellow fever have been synonymous terms, and in certain parts, through bad sanitation, the pestilence still lingers. In earlier years a great deal of the mortality among our troops in foreign stations was caused by improper and unwholesome diet and by the effects of intemperance. Another cause which operated in the same direction was the injudicious selection of barrack sites, a notable instance of which occurred in Trinidad about seventy years ago, where, after a million of money had been spent in new forts and barracks, it was discovered that they could not be inhabited even by Africans. A similar condition of things prevailed at Fort Augusta, Jamaica, where regiment after regiment was swept away by the malarious exhalations of an adjacent morass, until the spot was at last abandoned and left for a powder magazine. Such unhealthiness was due to the vicinity of large tracts of uncultivated land and marshes, from which the poisonous vapour rises as a dense cloud and penetrates into every valley and up every hill-side. The mortality amongst our white soldiers less than fifty years ago ranged on an average from 5 to 25 per cent. per annum; now it is little greater than that of British troops on home service.

The poisonous effects of the vapour arising from the decaying animal and vegetable matter with which the soil in hot countries is particularly impregnated are now well understood, and profiting by the experience of the past, all modern barracks in the tropics are constructed so that the ground floor is raised several feet above the level of the soil and the whole area of the site underneath covered with a layer of concrete, having a deep air space between.

Confined and defective barrack accommodation, however, was the main cause encouraging disease, and in Grenada troops were formerly housed in casemates beneath the forts, such chambers being devoid of windows and having thick walls, vaulted ceilings, and no means of ventilation. The death-rate was about twenty-two per thousand. The seasons are not distinctly marked, and drought, rain or heat seem to have no particular rotation throughout the year.

Planning and Construction.

General Design.—Houses in the West Indies are planned very much alike, and may be divided into three classes—(a) bamboo and

grass huts; (b) wooden houses; and (c) stone or brick buildings.

(a) These are merely one-roomed hovels, about 16ft. by 8ft., forming the abodes of the poorest class of natives who live in the bush. The framework is made of wood cut from the nearest plantation, roughly squared and fastened together with wooden pins. The walls are constructed of horizontal strips of split bamboo, between which the blades of coconut leaves are vertically interlaced. The roof is of steep pitch, hipped at both ends, and thickly thatched with the "thrashed" or stripped ribbon-like tops of sugar cane; the floor is of bare earth, and square apertures take the place of windows. These choice and picturesque specimens of rural villadom are thus referred to as "trash huts," a title that may be interpreted in more senses than one.

(b) Some of the wooden shanties to be seen in the towns are not much better, but in St. Lucia they are limited by a building by-law to 16ft. by 16ft. as a minimum size on the streets. They are most frequently built in semi-detached fashion, with one or two rooms each, and very narrow passages between leading to courtyards behind, where the space may be sub-let by the dwellers in front for smaller tenements. This consequently leads to "overcrowding in unsanitary areas," that bugbear of medical officers of health, though it is said that the authorities intend to prohibit this practice. The framework is of pitch-pine covered with weather-boarding; the floors are of wood, while the roofs are also hipped at both ends and covered with shingles, and a bell-cast being invariably given to the eaves aesthetically satisfies the eye. Split bamboos not infrequently form a substitute for eaves-gutters, and walls are often patched up with the sides of old tin cans—a ludicrous sight indeed. These "packing cases," as they are jeeringly termed, are of the most flimsy construction, and it would not be difficult to knock a whole house down, especially as the structure rests on four or more big stones by way of piers, looking as if with open arms they were inviting a gentle breeze to blow them all over. It is no uncommon spectacle to witness one of these negro huts being carried through the streets by less than a dozen men for the purpose of being deposited on a fresh site. "Where they put 'em" is a mystery that surrounds the occupants, but this can be partly explained by the fact that the people spend most of the day in the open air, only resorting to their cabins at night as so many sleeping berths.

There is a considerable step between the dwellings of the poorer classes and those of the planters and wealthier citizens. These again seem to be much of a pattern, for they are generally of a simple rectangular shape, or bungalow type, one or two storeys in height, with a 6ft. or 8ft. open verandah all round, the whole being raised above the ground on piers. As the verandah acts as a passage the rooms open into each other, and if the house be of one storey, open roofs take the place of ceilings, leaving trusses and rafters exposed to view. Creole builders seem to have little idea of the science of construction, for beams are run into walls anyhow without templates, and they as often as not rest over openings, while lintels have unequal bearings. Joists are spaced at 2ft. apart, and as there are no ceilings the underside is bared, making the floors very noisy to the people beneath. Partitions inside are only carried up some 8ft., leaving a clear space above, and this, together with the fact that everything is of wood, enables every sound to be heard throughout the building, so that in West Indian houses there is no real privacy. Double partitions and double-boarded walls are seldom put up, as the space between harbours ants, cockroaches, and other insects. Instead of windows there are jalousies (or louvred shutters), hung folding, and the verandahs and balconies are sometimes enclosed by fancy patterns of treillage. Roofs are covered with galvanised iron, and if they are of shingles there is the usual hip and bell-cast at eaves. The style of architecture is of the finicking American order, with fret-work patterns and restless ornaments, the initials of the owner being conspicuously carved as a

monogram in front. Kitchens, servants' quarters, &c., form separate out-buildings, this being a distinctive feature of the domestic life in this part of the tropics. A good house of this type, with two storeys and an attic, and containing two living rooms, six bedrooms, verandah, closets, and outbuildings, will cost £700, or less than 4d. per foot cube to build.

(c) Stone and brick buildings are only erected when they are of a public character, the difficulty of obtaining and dressing the local stone, and the necessity for importing bricks, lime, and cement, no doubt acting as deterrents in this direction. Such foreign building materials are necessarily more expensive on account of the heavy import tariff levied upon them, as well as the cost of freight in addition. Articles for the public service are exempt from duty.

There are many passable, if not fine, public buildings in the West Indies, and among those that I am personally acquainted with may be mentioned:—Codrington College and The Mutual Assurance Company's Buildings, Barbados; Government House and Roman Catholic Church, St. Lucia, both recently erected; the Roman Catholic Cathedral in Fort de France, the capital of Martinique, which is a magnificent structure, erected almost wholly of iron, and, indeed, the finest building in that material I have ever seen. The style of the whole is most harmonious, and free from any crude attempts at that imitation of stone ornament which usually mars all such works. The Cathedral in Antigua is a substantial edifice, with unpainted woodwork inside; but hard times press upon it and are leaving the fabric out of repair. A splendid Colonial Bank has just been put up in Trinidad, from the designs of Mr. L. Mallet-Poret. Stone and brick buildings are usually characterised by architectural neatness rather than by any pretensions to architectural beauty, but some of them possess features enough to make one gasp. These, of course, are trifles, and neither does such an anachronism as the proposal to put a Gothic spire on a Classic church ruffle the artistic susceptibilities of the worthy West Indians.

Military Works.—British and native troops are now concentrated in those positions which are of vital importance—that is, at Jamaica

and St. Lucia, leaving these islands the two military headquarters of the West Indies. In St. Lucia the more important barrack buildings are almost wholly built of imported materials. The foundations and verandah floors are of Portland cement concrete; dwarf walls, foundations, and plinths, of rubble stone or brickwork in cement; the superstructure of English bricks laid in Portland cement mortar, 1 to 3; pitch-pine is used for ordinary woodwork; white pine for scaffold planks, sheeting, and centering; native hardwoods supply fencing, posts, and outdoor work; and galvanised corrugated sheet iron is the common roof covering. Rubble masonry is often built in lime mortar mixed with a little cement to strengthen it. Eaves-gutters and ridging ought to be of galvanized iron, as those painted will not withstand the corroding effects of the climate. Rain-water pipes and eaves-gutters must be of ample size—to carry away the heavy fall of rain. Roofs should be of timber or light iron trusses, according to the span, with boarded ceilings and ventilators where necessary. The buildings are of simple rectangular shape, generally two storeys high, with a verandah, at least 10ft. wide, round each floor to mitigate the heat and glare of the sun, and to afford a cool sitting place. As the verandah is used for a gallery, there are no inside corridors, the rooms being entered direct from the outside. The staircases are of iron and are often placed in the verandahs, which have concrete floors supported on a wrought-iron framework with columns and railings of the same material, except upon upper floors, where the two last may be of wood. As before stated, it is most important that all dwellings in the tropics should be on stilts, as it were, the ground floor elevated several feet above the level of the soil, with a layer of concrete underneath sloping outwards. The space between should admit of being cleaned out, and be kept free from wet, refuse, or dirt of any kind. Doors are about 8ft. high, with fanlights or louvres above, and the casement windows have a similar arrangement, the idea being to get as much circulation of air as possible; with the same object in view rooms are lofty.

The aspect of the more important barracks must be carefully chosen, more especially with

reference to the prevailing winds and rain, which drive in from the north-east. This selection is often difficult because of the crumpled configuration of the country, which renders compulsory the good plan of short blocks with a free play of air all round them. The heavy penetrating showers necessitate all walls being built in cement mortar; and storm shutters, and even double doors, are sometimes required on exposed sites to resist the fury of the elements.

The artificer's work is entirely done by day work by the natives, without the intervention of a contractor, such a thing as a general builder being unknown in most of the islands. Of the tradesmen, it may be said that they are naturally inferior to British workmen, and extremely slow, but a few of them by dint of practice on War Department buildings have come quite up to the home standard, and no doubt the others will improve. Masons can undertake only the roughest description of rubble work, and will persist in building walls with two outer skins filled in anyhow with spalls, and without bond. Bricklayers can lay only 300 to 325 bricks per day at the utmost, and when the military works were started nine years ago there was not a man who could lay a brick; some can now build a wall if the levelling and plumbing of each course is checked and corrected for them. Native carpenters and joiners are pretty good, but it is necessary to give them a great many explanations. Women do most of the labourer's work, and carry everything on their heads, from a bucket of water to an empty bottle. The men are lazy, and many of them will not exert themselves unless the eyes of the foreman are upon them. Procrastination is one of their chief faults, and "Never do to-day what you can put off till to-morrow" is their motto. Knowing these characteristics, the system of piece-work is found to be of service, for the negro will hurry up with his set task in order to idle for the rest of the day, careless of the extra pay he would otherwise earn. Wages are, for timekeepers, 3s. 6d. to 5s. per day; for skilled tradesmen, 3d. to 5d. per hour; for labourers, 2d. to 3d. per hour; and for women, 1s. to 1s. 2d. per day.

Though workmen are only paid about half English rates, yet the cost of labour is con-

NATIVE HOUSES, ST. LUCIA.

STREET IN BRIDGETOWN, BARBADOS.

siderably higher than at home, as the men are naturally slow and indifferent. This, together with the increased price of imported materials, runs up the cost of erection to something like 25 or 30 per cent. above that in England. The value of labour, especially, is very fluctuating, and it is found that the cost of works depends almost wholly upon the closeness of supervision and upon the energy and dominant power of the foreman. Prices cannot but be empirical, and estimating must be largely a matter of conjecture, which no amount of experience will render altogether reliable.

Colonial Works.—All the more important islands of the West Indies possess a Public Works Department presided over by a Colonial engineer, for the execution of the public works of the colony, such as Government buildings, roads and bridges, harbour works, waterworks, telegraph lines, etc. Persons who desire to practise as private land surveyors must serve a three years' apprenticeship with the Colonial or other commissioned surveyor, and must pass a qualifying examination.

Sanitary Arrangements.—The dry earth system is usually adopted, the soil being removed nightly and carried out to sea in the early morning by a hopper barge. Water is mostly obtained by collecting the rainfall from roofs into cisterns, or from wells or regular waterworks. For drinking purposes this water is afterwards filtered and boiled. Legislation is provided in various Public Health Ordinances for securing the health of the inhabitants generally: for regulating the width, and insuring the cleanliness of streets and public places; for controlling the erection of houses, buildings, and structures of all kinds; and for the suppression and abatement of nuisances. The pollution of rivers and streams is forbidden, washing clothes in them being one of the principal causes of fouling. It is needless to add that there are very stringent quarantine regulations, strictly enforced.

Building Materials.

Stone.—As previously stated, the building stones are rather limited. They are mostly greenstones and basalts, trachyte lava, coralline and dolomitic limestones, quartzites, sandstones, and porphyrites. The first are dark, close-grained, and compact, and very durable. The limestones are soft, apt to fly under the chisel, and more suitable for internal than external work. There are scarcely any proper quarries, and stone is mostly obtained by breaking the huge boulders found in river beds and valleys. Owing to the difficulty of working, and to avoid the unnecessary dressing, concrete blocks have been used as quoins, voussoirs, sills, and copings, in place of stone, in Government House, St. Lucia, as well as in recent military and other buildings.

Bricks and Tiles.—Military buildings in St. Lucia are mostly built of bricks imported from England. These are Gaults, hard and of a light-yellow colour, weighing 6lbs. each, and

absorbing $\frac{1}{10}$ th of their weight in water after twenty-four hours' immersion. Bricks should be sent by sailing ships, as these generally deliver them with much less breakage than steamers do, and the charge for freight is less. Many buildings are covered with red tiles, which are manufactured in Martinique and other places. But tiles are being superseded by galvanised iron, which gives a light appearance to the large buildings, especially as these are generally plastered and coloured on the outside.

Timber.—The most important West Indian woods are mahogany, green-heart, purple-heart, mora, angelin, balata, cedar, cocoa-nut, fustic, galba, gri-gri, groo-groo, iron-wood, laurel trees, lignum-vitæ, locust, logwood, mangol mangrove, mastic or gum tree, palatuvier, rosewood, sapodilla or naseberry, satinwood, simaruba or bitter ash, tamarind, torch wood, and yellow sanders. Of the foregoing mahogany, green-heart and balata are the most valuable for general purposes, and are most common. It would be too tedious to enumerate the characteristics and uses of all these woods, but those of mahogany and green-heart are well-known to us all.

It is very difficult to determine the classification of West Indian trees, as the names of perhaps the same tree vary in different islands, while the variations of patois titles also lead to much confusion. Specimens of some of these woods were sent to the Colonial and Indian Exhibition of 1886, and were then permanently housed in the Imperial Institute, where they may now be seen, as well as a

collection of specimens from all the British Colonies. Various compilations on West Indian timbers have been made, but these are not always easy to obtain. Gum and resin-yielding trees abound, and commercially valuable fibres may be stripped from quite a number of them. The barks, leaves and berries of others furnish well-known drugs, dyes and spices. White pine and pitch-pine are largely imported in sawn scantlings and boardings for all common work. The former comes from Canada, and the latter from Florida.

Attacks of Ants, Worms, &c.—With the exception of some of the bitter and hard woods, most of the timber is liable to the attacks of "white ants," commonly called woodlice, and this is especially the case with white pine and white oak. These ants do not attack sound wood, but only that which has first been permeated by the mycelium of a fungus, which has probably found entrance to its tissues at some point of injury, as, for example, any spot which is rendered damp by leakage from the roof or other cause. The insects thus follow the attack of the fungi, and as they eat away the heart an apparently healthy piece ultimately becomes nothing but a mere shell, which suddenly collapses without warning. To escape their depredations the builder must therefore first of all prevent the attack of the fungus by insisting upon conditions which will ensure perfect ventilation and dryness, which are well known to be antagonistic to the growth of this form of vegetable life. One cure is said to be a treatment of calomel, or of molasses and arsenic, but the pests often reappear. Kerosene is effective whilst its smell remains.

Seasoning.—Timber may be cut down at any time of the year, but it is preferable to do so during the dry season, and before the wet months commence (on the same principle as felling at home in the winter, when the sap is down), as the trees then become extra sappy with the absorption of the moisture. Native wood-cutters have an idea—which may be laughed at, but which is believed to be right—that if the trees are not felled during certain phases of the moon, the timber is almost certain to be attacked by woodworms or borers, and the months of February and March are generally preferred by them for hewing. Practically this has been found to be correct, and the period between three days after new moon and three days before full moon is the time selected. Trees should be squared and cut up immediately after felling, and the wood should not be worked for six months, or even a year, during which period it ought to be stacked and well covered in sheds, with a free circulation of air round the several pieces, otherwise it will warp and twist when used. Owing to the readiness with which it is attacked by ants, all wood in store,

STREET IN CASTRIES, ST. LUCIA.

especially unwrought spars, should be stowed away so as to admit of easy and frequent inspection; this liability to attack is greatly increased if the bark be left on.

Roofing Materials.—These are: shingles, tiles, galvanised iron, zinc, concrete, and vulcanite. Shingles are mostly used, as they are cheap and light. The best are Cypress and Wallaba, imported from Carolina and Demerara, respectively. They last about twenty-five years, but require frequent repair, and promote vegetable growth. The largest size is 22in. by 6in., and they are sometimes painted to imitate tiles. Tiles are made in Martinique, but they are heavy and absorptive, and are unsatisfactory unless bedded in mortar. I have seen a red tiled roof repeatedly covered with long grass, owing to the absorption of moisture in so humid a climate. Corrugated galvanised iron has proved by far the most satisfactory material. It is quick and easy to lay, and light, but must be well secured from hurricanes. It should be boarded and felted underneath, or this covering will be hot, and noisy from rain. Zinc has the same qualities as galvanised iron, but it expands and contracts considerably, and is not often employed.

Flat concrete roofs have proved very unsatisfactory owing to cracks repeatedly occurring. The reason appears to be the very rapid change of temperature, caused by brilliant sunshine being frequently followed, without any transition, by torrents of rain. Vulcanite roofing has been tried as an experiment in St. Lucia, and as it is flat it minimises the resistance to the wind. So far it has been very satisfactory, and is being further adopted. It is supplied by an Irish firm from Belfast. Slates are rarely employed, and they suffer much from breakage in transit. Thatch is only resorted to on the lowest class of negro huts.

Metals are imported, and I am not aware of any West Indian foundries.

Paints, varnishes, &c., are all imported. R. Gay and Co.'s "Impenetrable" paint has been extensively used on military buildings in St. Lucia, and has the advantage of being sent out ready mixed for use. But it rubs off in dust and powder within a very short period of application, from exposure to the sun. Torbay paint behaves in a very similar manner, and in fact most paints perish rapidly when employed externally. They likewise become sticky from the combination of hot and damp atmospheres. The experiment has been tried of sanding over external painting to protect it from heat, a mode of work that has been adopted in America. Pitch and asphalt can be obtained from the famous Pitch Lake in Trinidad, which is more than a hundred acres in extent, and a mineral tar comes from Barbados. Native sulphur can be picked up at the various sulphur springs, and pumice is likewise to be found. The majority of things purchased locally are inferior and expensive, and this is especially so with ironmongery, roofing iron, &c., which are of very flimsy make; glass is particularly dear. It may be said that the islands generally possess good resources in building materials, which require developing, but for this capital and enterprise are necessary, which do not seem to be forthcoming on account of the poverty of the inhabitants since the decline of the sugar industry. Let us hope that brighter times are coming for these islands of romance, which long ago stirred the imagination of the great Columbus and his long train of succeeding adventurers, but which now stand as deserted outposts on the wider rim of our advancing Empire.

South Library, Liverpool.—There is every probability that the erection of the promised South Library, Liverpool, will be proceeded with before long. Operations were postponed some time ago owing to lack of funds at the disposal of the Library Committee, but after a good deal of consideration a reduction in the cost of the proposed building has been effected. The city surveyor has now been instructed to prepare new plans for a library, the expenditure on which is not exceed £12,500.

STENCILLING TOOLS AND THEIR APPLICATION.

IN studying stencilled work it must be remembered that connecting and supplementary lines are a very essential part of the design. Connecting lines are better executed with a flat fitch or lining tool and straight edge than by the lining pencil, unless the lines are curved and irregular or are broken in short lengths by stops, or are curved or irregular in shape, when they may either be cut in the stencil pattern or done by specially-cut stencil lines of the exact curve or shape required. In lining with the fitch and straight edge, a good lining fitch or tool and a perfectly straight-edged lath are obviously necessary. Some scene painters and decorators prefer a long hair fitch, so that it will hold a larger modicum of colour, thus enabling the painter to run a long stretch with one dip of colour; but others prefer a short hair fitch. The long hair fitch is a useful tool, but requires great skill in order to keep the line of one uniform thickness throughout, and the slightest inequality of pressure will cause the brush to spread, thus rendering the line irregular; for if the extreme ends of the bristles are used without direct pressure the line will be of the same thickness at the end of the tool. The fitch should be held by the extreme end of the handle, so that the pulsation will not cause it to waver, as it may do if held too tightly, the pulse controlling the motion of the fitch along the straight edge. A good lining fitch will form throughout a line of exactly the same width as the width of the end of the brush. Such a fitch should be fixed in tin, secured in the ordinary way to a flat wooden or round handle, the bristles extending from the tin about $\frac{3}{4}$ in. The bristles should be close and compact and firm in the body, so that they will not spread to any appreciable extent except when pressed very hard. A tool of this kind will run a line of the exact width, or nearly so, of the thickness of the bristles it contains. In use we require to have them of different widths and thicknesses to run lines from $\frac{1}{16}$ in. to $\frac{1}{2}$ in. in width. When lines of more than that width are required it is best to run two lines on the outside edges of the width of the line or band required, and to fill up the space between with a fitch or other tool. With a good tool of this description, filled with colour and laid with its side against the straight edge, with the ends of the bristles touching the wall or ceiling, it only requires to be kept steady and drawn carefully along to form a perfectly straight line of uniform thickness throughout. Both on the walls and ceilings chalk lines should always be struck as a guide to place the straight edge to avoid mistakes. The colours to be used in lining with a fitch should be so mixed as to work freely; thick colours, besides not running freely, will not leave a sharp cut line. Use thin colour, either in water or oil. In lining, it is best to draw the lining tool along the straight edge with a quick and steady motion, avoiding the pulsative motion before mentioned, when the line will be truer than if it is drawn with a slow graduated motion. The straight edge should be from 2in. to 3in. wide, and about $\frac{1}{2}$ in. thick (if very long, a trifle thicker), both edges being bevelled to about $\frac{1}{4}$ in. in thickness. The most useful length is about 3ft., as it can be held by the workman with one hand while he uses the fitch with the other. The straight edge should be wiped frequently. Fitch lining and pencil lining differ in the fact that in running light coloured lines on a dark ground the pencil will leave a much heavier and more solid body of colour than is possible with the fitch, but for lining on walls and ceilings the fitch is decidedly the better tool. Lining pencils differ from all other pencils in having a square end, being made with hair considerably longer than any other kinds. Those not having a straight edge and used for striping are generally about 2 $\frac{1}{2}$ in. long in the hair and of various thicknesses. Sable hair, of which the best pencils are made, is obtained from a species of marten, but it differs from the marten hair proper in having a strong spring and fine soft point.

Cheap sable pencils are usually made of sable and marten hair mixed, or sable and dyed camel hair. The red sable is obtained from a different animal. It is a much stronger hair than the others, but being less pliable is not so reliable for making good pencils. It is, however, of great service in manipulating heavy pigments, such as white lead, vermilion, &c. Red sable is obtained from Russia and Siberia. The high price of sable pencils arises from the fact that it is only the hair on the tails of the animals which can be used for the manufacture of pencils. For running lines with a straight edge the best hog-hair bristles are indispensable, but ox hair makes a good pencil for most purposes. In stencilling a short brush is best and cleanest. W. N. B.

"THE BUILDER."

Who's sent for when the pipes are "bust,"
Or when a crack lets in the dust,
And tell him come at once he must?

The Builder!

Who on the roof tops has to get
To find out wherein comes the "wet,"
And finds it's but a jug upset?

The Builder!

Who's blamed about the copper flue
(The bricks blown out by Poll and Sue
Don't count), and told his work won't do?

The Builder!

From church on Sabbath morn who goes
To meekly settle cooking woes,
And show them how the "damper" goes?

The Builder!

Who sets a drain all "spick and span,"
Is told, "your drain's a fraud my man,"
Then finds a boot-brush down the pan?

The Builder!

And if the parlour door won't fit,
And folks in comfort cannot sit,
Who's called in "just to ease a bit"?

The Builder!

Who must not sleep by night or day,
But close attention always pay,
Is told for thanks he's "in the way"?

The Builder!

And when he's done his best to please
And dares to claim a well-earned ease,
Is frowned at when he asks for fees?

The Builder!

The only respite he can crave,
The rest and quiet of the grave;
For him a meed of pity save—

The Builder!

G. D.

Proposed Baths for Rotherham.—The Town Council of Rotherham propose to borrow £2,000 for improving their public baths. An enquiry has been held.

Canklow Mission Church, Rotherham.—This new building consists of a nave only, 80ft. by 36ft., with a temporary vestry and parish room at the east end. When completed, there will be in addition a chancel, north and south aisles, organ chamber, and vestry. The architect is Mr. E. Isle Hubbard, M.S.A., of Rotherham, and the cost up to the present has been £1,850. Mr. W. H. Trehern, of Parkgate, is the general contractor, and Messrs. W. Truswell and Son, of Sheffield, have had charge of the heating arrangements.

Edinburgh Architectural Association.—The Edinburgh Architectural Association recently visited Ravenscraig, St. Serf's Tower, and Dysart House, by permission of Mr. Michael B. Nairne. The party drove first to Ravenscraig, when Mr. J. A. R. Inglis, A.R.I.B.A., in describing the castle, said that, built in 1460, its plan was of much interest, and that, unlike many similar Scottish buildings of the period, the name of its builder, the date of erection, and even the cost of much of the material were still on record. The members then walked to St. Serf's Tower, when Mr. Inglis pointed out that the north aisle had been wholly sacrificed to form the new road.

Views and Reviews.

GAS, WATER, AND ELECTRIC LIGHTING.

Mr. Lawrence Duckworth has produced a very handy little volume on the Law relating to Gas, Water, and Electric Lighting, so far as it affects consumers. We cannot lay too great a stress on the importance of having a knowledge, such as this book affords, of the Law relating to these burning questions of the day, so constantly before the public in municipal and private affairs. The amount of useless litigation over these questions, due to inadequate knowledge of the most simple outline of the Law, is immense, and it reflects, therefore, considerable credit upon Mr. Effingham Wilson, the publisher, that he has sought to remedy this source of worry and loss by providing a series of cheap hand-books upon various sides of the Law, such as this one gives. The usefulness of the book is further enhanced by particulars of the authorised rates of charges for water supplied by the different metropolitan water companies. Reference has also been made to the Electric Lighting (Clauses) Act, 1899, and a good index is provided.

"The Consumer's Handbook of the Law Relating to Gas, Water, and Electric Lighting." By Lawrence Duckworth, Barrister-at-Law. London: Effingham Wilson, Royal Exchange, E.C. 1s. 6d. nett.

LONDON BUILDING ACT APPEALS.

This book is written with but one object, to enable an intending applicant or, say, his architect or surveyor, wishing to exercise his rights of appeal to the Tribunal to do so personally without employing counsel, solicitor, or agent, and no doubt there are many who will find the information given of the greatest use to them, as everyone is delighted to escape legal fees if it is in any way possible to do so. The Tribunal constituted under the London Council (General Powers) Act of 1890 consisted of three members, severally appointed by the London County Council, the Council of the Royal Institute of British Architects, and the Council of the Surveyors' Institution. This Tribunal gave such satisfaction in working that it was decided to continue it, with certain alterations and with extended powers, under the London Building Act of 1894, and the gentlemen who now represent it are Mr. Arthur Cates, chairman (appointed by the Council of the Royal Institute); Mr. John Wornham Penfold (appointed by the Council of the Surveyors' Institution); and Mr. Alfred Arthur Hudson, barrister-at-law (appointed by a Secretary of State). The author has dealt with the matter in a most practical and lucid manner, which, considering his position as clerk of the Tribunal, is only to be expected. Nevertheless, we have here a compact book which will be much valued by those applicants who desire to use their powers without the aid of a legal gentleman, though the latter, of course, can hardly be expected to regard it with enthusiasm.

"The Tribunal of Appeal under the London Building Act." By Charles H. Love. London: P. S. King and Son, 2 and 4, Great Smith Street, Westminster. Price 3s. 6d. nett.

ST. PAUL'S CATHEDRAL.

This volume, like the former numbers of the series, is a handy little guide book, and we presume that that is its only aim. This volume is perhaps more disappointing to architectural students than others of the same series have been, for although there is given a good deal of what is generally known about Wren and his great work, fifty-four pages out of the 148 are devoted to Old St. Paul's—interesting matter in its way but purely antiquarian. The consequence of this is that the matter relating to the present cathedral is not by any means so full as it could have been with advantage—and we are not now speaking from the architect's point of view, but generally. Perhaps it is too much to expect any ordinary clergyman to treat a book on an architectural subject architecturally and give us something new on the subject, still less to give any valuable original

criticism, and it must in fairness be recognised that there are popular handbooks in which a modicum of architectural lore is all that can be looked for. The illustrations to the volume cannot, of course, be expected to be of great value, owing to their small size, but this is not anything against the book, for it would have served its purpose as a guide-book almost as well without them. There are a few short accounts of the monuments in addition to those of greater length on the building itself, but the greater number of these memorials are merely catalogued, which is, of course, purely ridiculous in a book of this character, for the information can be obtained more easily from the monuments themselves as one is going through the cathedral. Unless some interesting narrative or criticism can be given these notices of monuments had better be left out, and reserved to large works on the subject that may be consulted as catalogues. Again, the appendix containing lists of bishops and deans is of little general interest. The book is a cheap one, and will, perhaps, be of use to country and foreign visitors who require a convenient guide to the points of interest.

Bell's Cathedral Series: "The Cathedral Church of Saint Paul: An Account of the Old and New Buildings, with a short historical sketch." By the Rev. Arthur Dimock, M.A. London: George Bell and Sons, York Street, Covent Garden, W.C. 1s. 6d.

STEAM LAUNDRIES.

In this little book it is only the first part, dealing with construction, that is of special interest to the architect, and though the information given savours somewhat of the layman, it is good so far as it goes. The remainder of the book, that is to say, nine-tenths of it, describes the various washing machines, ironing machines, and other laundry appliances, and supplies much that would be useful to a prospective manager of one of these establishments. As the most important considerations, the author places first the proximity of labour, then the water supply, next the coal supply, and then the disposal of sewage, and points out that a niggardliness in first cost will entail much inconvenience and prove to be a false policy. The laundry should also be near the gas supply, on account of the number of standard machines that are heated by this means, electrically-heated irons and ironing machines not having yet proved a commercial success, however clean and handy a power electricity may be. To show that the author does not approach his subject exactly from the standpoint of an architect, we may cite the following passage, which speaks for itself:—"The nature of the ground upon which the laundry is to be built is of some, but not very great importance, so long as a good foundation can be obtained without excessive cost. A site running along a railway line is not advisable, as the vibration of the trains injures the foundations of the building and the seatings of the boilers; but if any of the principal items before noted are available on such a site, for example, 'a good water supply,' this position need not be considered detrimental to the site, but great care should be taken in laying out the foundations, and an extra thickness of brickwork should be given to the boiler seatings." The author points out that architects, when designing the roof of a single-storey building, should not place the principal beams more than 8ft. to 10ft. apart, on account of the shafts which these beams usually have to support. The case given for the drain-layer is rather difficult and amusing. No straight length of drain is to be more than 20ft. without an inspection chamber, because "it is no unusual thing for bundles of towels, body linen, and lumps of waste, coal and coke, scrubbing brushes, and pieces of wood to find their way into the laundry drain, in spite of each drain having a grate on it," and "laundry employees as a rule are not very particular as to what they throw down the w.c." In this case, we think it is the employees and the gratings that want looking after, though we are at one with the author in demanding the best drainage work for laundry purposes. The book is produced in a handy form and includes a small

plan of a model laundry "to wash £100 per week, family work," which should be useful to some of our readers.

"The Steam Laundry: its Construction, Equipment and Management." By John Taylor, A.I.M.E., &c. London: Heywood and Co., Ltd., 153, Holborn. Price 7s. 6d.

Correspondence.

Mitchell's Building Construction.

To the Editor of THE BUILDERS' JOURNAL.
LONDON.

SIR,—The criticism by A. R. J. on page 155 of your issue for April 4th is most excellent. It is a pity there are not more of such reviews. In my short career I have had occasion to dive into many of these so-called text-books to prepare for several examinations, and I have mostly bewailed the absence of the whys and the wherefores of the particular subject treated; and I must avow that to enable me to be successful in those many examinations I had to obtain the whys and the wherefores from other sources than text-books. May I ask, cannot we have these whys and wherefores embodied in the text-books, and obtain practical experience as well as theoretical?—Yours faithfully,
F. F.

Building Stones Around Liverpool.

To the Editor of THE BUILDERS' JOURNAL.
36, DALE STREET, LIVERPOOL.

SIR,—My attention has been drawn to an article in your issue for April 18th last on "Building Stones Around Liverpool," by Ernest C. Aldridge. On page 187 he states that he is afraid we will have to speak of Stourton in a past tense. You will observe from the circulars I am sending you that I have taken over the Stourton Hill Quarries from Messrs. J. D. and W. Bulcock for a term of years. It is my intention to re-lay the railroad from the quarries to the L. and N. W. and G. W. joint railways, and to forward through Port Sunlight and Bromborough Pool. I think Mr. Aldridge will find that if this is done I shall be able to make a greater output than has been done by any of the previous lessees.—Yours truly,
J. SIMPSON.

A new Congregational Church at Olton is being built from the designs of Mr. John P. Osborn, of Birmingham. It is situated in Kineton Road, and Mr. J. A. Turton, of Birmingham, is the builder. The style of the buildings, which will be of red brick, with stone dressings, is Perpendicular Gothic, and the block will consist of chancel and vestries, with a commodious schoolroom, already erected at the rear of the church. Accommodation will be provided for 350 worshippers, and the cost of the work will be about £3,500.

The Temple of Karnak in Danger of Demolition.—At the conclusion of an article on "Archaeological Discoveries in Egypt, 1899-1900," which appeared recently in the "Times," the Cairo correspondent refers to the fall of the nine columns in the Temple of Karnak last year and says: "Two of these columns fell against the pylon and dangerously unsettled that huge mass of masonry, the whole of which now threatens to topple over inwards and knock down like nine-pins the famous rows of columns of the hypostyle hall. Every precaution that can be devised to avert this catastrophe is being taken by M. Maspero and his staff, whose workmen, by the erection of a scaffolding between the north and south sides of the pylon, and supports of iron, wood, and earth, are endeavouring to hold the masonry in its place. The critical period will be during the Nile flood this year, whose subsidence may cause dangerous movement of the soil. After that a attempt will be made to take down the wall of the affected angle of the pylon and rebuild tier by tier; but unless and until this can be done the European public must be prepared to hear of an unparalleled disaster which no human science or effort may be able to avert."

ARCADE OF ST. AGATHA'S ABBEY, EASBY.

ARCHITECTURAL STUDIES IN YORKSHIRE.*

BY G. BERTRAM BULMER, F.R.I.B.A.

THE theme of the present paper is not a great one, nor one that commands the grand, the majestic, or the colossal, but a more simple one dealing with little bits and details of architectural interest in Yorkshire, details that have a peculiar charm of their own which is just as attractive as that of the larger works.

Porch of St. John's Church, Adel.—Adel is situated about six miles from Leeds. It derives its name from the Saxon "Ada," and was the site of a Roman station called Burgodunum, indications of which have been discovered from time to time. The existing church is a fine relic of the Norman period. The south porch, shown in the accompanying illustration, with the sculpture over the archway, is a splendid specimen of the art of that period. These sculptures, it may be noticed, are each on separate stones, wedged in or fitted to the irregular space formed by the gable and outer line of the arch, and not carved on the courses of masonry, a practice often followed in later and modern work. The interior shows a fine chancel arch of Norman work. The church was renovated by the late George Edmund Street, R.A. There is a dragon's head carved on the apex of the porch gable, with curious eyes of inlaid work. Some of the original narrow round-headed windows remain. The curious corbeling to the parapet is indicated in the drawing, as well as the flat pier or buttress usual to the period. The window shown is a modern insertion. The dimensions of the porch are: Width, 14ft. 6in.; height to eaves, 10ft.; and height to apex of gable, 18ft. 6in.

Arcade of St. Agatha's Abbey, Easby.—St. Agatha's Abbey is situated near the River Swale, which winds round the base of the massive cliff on which stands the famous Castle of Richmond. It is distant about one mile from the town, and rises with varied outline from the undulating meadows which slope gently towards the edge of the river. The abbey was erected about 1152 and is a specimen of Early English architecture retaining the Norman method of interlacing the arches. By this treatment the two single lights (which were once the windows of the abbot's house) are made an imposing centre to a handsome façade, and the careful student will not fail to observe the clever treatment of the interlaced arches, which are struck from varying centres to suit the narrower width of the two blank arches. There is also to be noticed a peculiarity in the

string mould above the arcade, which is worked out of the solid course of ashlar, and not in a thin course of stone as usual. The

circular caps and bases are an indication of the period, and the style of the carving, imitated from natural foliage, displays the guiding hand and eye of the skilled workman. The remaining portions of the building are very varied in design, even in cases where the work is evidently of the same period; and parts may be selected which are in themselves excellent examples of the diversified treatment of which our ancient English architecture is susceptible. The abbey gate-house is a pleasing specimen; adjoining it is the village church. The dimensions of the arcade illustrated are: Width between shafts of centre lights, 4ft. 7in.; width between side compartments, 4ft.; height from sill to springing line of arch, 4ft. 9½in.; depth of caps, 10½in.; and thickness of wall, 3ft. 3in.

Stall End at Holy Trinity Church, Wensley.—Not far from Leyburn Station (which is on a branch line of the North-Eastern Railway) stands the Church of the Holy Trinity in the charming village of Wensley. The building is of early date. Among the interesting objects in its interior is the bench or stall end illustrated on this page. It is a well-executed and carefully-designed piece of work, and was saved from destruction on the dissolution of Jervaulx Abbey. The large heraldic panel bears the arms of Scrope and Tiptoft, with helm and two Cornish choughs as supporters. The stall fronts shown in the drawing are dated 1527. The visitor to Wensleydale should not omit to see this church and its fine remains of

PORCH OF ST. JOHN'S CHURCH, ADEL.

* Portion of a paper read before the York Architectural Society.

STALL END AT HOLY TRINITY CHURCH,
WENSLEY.

ecclesiastical woodwork. The following are the dimensions of the stall end illustrated: Width across widest part, 1ft. 4½ in.; width across narrow part, 11 in.; height, 4ft. 10½ in.;

height to underside of dragon, 3ft. 3½ in.; height to eaves of gablet, 2ft. The thickness of the wood is 4 in.

Rood-loft at St. Michael's Church, Hubberholme.—Hubberholme may be approached from Skipton by post-cart, or from Settle or Ribbleshead Stations on foot, a distance of fourteen miles. This rood-loft, singing loft, or music gallery is over the screen dividing the nave from the chancel, but is apparently not exactly in its original position, as modern alterations have wiped out all trace of the stair or other approach which it must formerly have possessed, and there is no mode of access to it at present. The surfaces of oak, which are bare, betray no signs of stain or varnish, and colour decoration remains in many parts. The tracery panels are tinted a mustard yellow, and the uprights between are of a dull red, with white margins, enriched with black scrolls and dots. The top rail has traces of colour in a pattern of black and yellow lines. The bottom rail has a black scroll pattern on the oak ground, with lines of black and yellow; on the bottom edge is a bead mould of dull red, with hollows of black, and the soffit is white. The floor is decayed, and the woodwork of the gallery has a more ancient appearance than the woodwork of the screen. The dimensions are: Height of screen, 8ft. 6 in.; height of gallery front, 2ft. 6 in.; width of gallery inside, 5ft. 10 in.

The Courtyard at The Castle, Skipton.—This castle was built by Robert de Romille, and is quadrangular on plan, with several circular towers for purpose of defence. It was many times besieged in the Wars of the Roses, and in the reign of Charles the First it was held against the Parliamentarians for three years,

but ultimately surrendered. In 1649 the Countess of Pembroke restored it and made it habitable, and it is now occupied by the steward of the Earl of Thanet. The present entrance is a comparatively modern building, having an archway between two circular towers, and the portion above the arch is finished with a parapet formed of the letters "Des-or-mais." Internally, many portions of the building are in ruin. The accompanying illustration shows a doorway above which is a large bas-relief of the arms of Clifford. Its dimensions are: Height of door, 6ft. 6 in.; height to panel, 10ft. 6 in.; height to top of panel, 16ft. 6 in.; width of door, 3ft. 3 in.; width between windows, 7ft.; width of bay windows, 12ft. 6 in.; width of window lights, 1ft.

ROOD LOFT AT ST. MICHAEL'S CHURCH,
HUBBERHOLME.

DOORWAY AT THE CASTLE, SKIPTON.

Principal Entrance to King James's Palace, York—Now known as the "Wolverforce School for the Blind," in Bootham, York, this building was erected by James the First as a Royal abode for his use when travelling northward. The present building is a more or less heterogeneous mass of various dates and styles, but the entrance illustrated is a fine example of the free classic treatment of King James's time. There are two doorways of this design opening into the entrance court, one only, however, with the Royal arms, and in the interior are some excellent details of the period, notably a fine arched stone fireplace, with carved vou-soirs and a plaster ceiling and frieze. In examining the design of the principal entrance the reader will not fail to notice its delicacy of detail, and the richness of the carefully studied ornament which covers its surface. The caryatides at the side are supposed to be representative of the king and his consort. The panels on the dado beneath bear the Royal initials, "J. R.," under a crown, and the spandrels of the arch have been enriched with well-modelled symbolic sculpture. The whole is surmounted by a bas-relief of the national arms; the "supporters" are holding erect two bannerets. The ground-work of the panel is diversified with an enrichment of the rose, shamrock and thistle. The dimensions are: Width of frontispiece, 7ft.; width of door-opening, 4ft. 6 in.; width of heraldic panel, 6ft. 9 in.; height of pedestal, 3ft. 3 in.; height to spring of arch, 6ft. 6 in.; height of entablature, 9ft. 4 in.; height to top of entablature, 11ft. 4 in.; height to top of heraldic panels, 15ft. 6 in.

Chimney-piece at the Swan Inn, Knottingley.—In the main street of Knottingley is the Swan Inn, an ancient residence of a branch of the Ingram family. It is now in the possession of

PRINCIPAL ENTRANCE TO KING JAMES'S PALACE,
YORK.

Mr. Benjamin Atkinson, who resides in a portion of it, and by whose permission a reproduction is given of the finely-sculptured stone chimney-piece which has decorated a large room on the chamber floor, now divided into smaller apartments. In some of the rooms the old mantels still remain, as well as a considerable amount of wainscot panelling. The dimensions are as follows: Width of chimney-piece, 7ft. 10in.; width of fireplace, 5ft. 10in.; height of fireplace from floor, 4ft. 7in.; height from floor to top of cornice, 7ft. 3in.; height to top of sculptured panel from floor, 10ft. 6in.; height of room, 13ft. 4in.

Entrance Gates to the Old Hall, Knowsthorpe.—The village of Knowsthorpe, or Knostrop, situated about $1\frac{1}{2}$ miles to the east of Leeds, has an old Hall which was once the mansion of the Baynes family, who possessed it up to 1843. The gateway shown in the drawing is immediately opposite the front entrance, and is a picturesque, carefully-studied feature, with its flight of semi-circular steps, massive square piers, and its unique "chairs" of solid stonework, exhibiting an independence of thought on the part of the designer worthy of the present day. At one side of the building is to be seen the remains of a handsome porch, with open arches on two sides, and panels in the haunches bearing shields; right and left of the entrance arch are two rudely-carved statues on pedestals; in consequence of frequent alterations, however, it is difficult to ascertain its exact relationship to the main building. The dimensions are: Width between piers, 8ft.; width of pier, 4ft. 4in.; height of pier, 8ft. 7in.; height of plinth, 1ft. 5in.

FIRE TESTS WITH PARTITIONS.

THE British Fire Prevention Committee send us Nos. 44 and 47 of their publications, dealing with partition tests. An account is given in the former of a fire test with a partition made by the Mural and Decorations Syndicate, Limited, having an area of about 75ft. super. and a width of 10ft. Seven weeks (winter) were allowed for construction and drying. Whilst the heat was being applied a portion of the setting coat on the fire side of the partition fell, and hair cracks, from which steam escaped, appeared from time to time on the passage side of the partition. On the application of water to the fire side of the partition a considerable portion of the setting coat was washed off. The temperature of the outside face of the partition during the latter part of the test was too hot to bear the hand, although not sufficient to

ignite a vesta by contact. The fire did not pass through the partition, though the highest temperature recorded was 2,130 deg. F. The test lasted an hour and a quarter. Publication No. 47 gives the result of a fire test with a matchboarded partition filled with silicate cotton (slag wool) made by Messrs. D. Anderson and Son, Ltd., and Messrs. J. C. Broadbent and Co., Ltd., both of London. The partition had an area of 75ft. super., with a width of 10ft., and the object was to record the effect of a fire of forty-five minutes' duration commencing at 300 deg. F. and increasing to 1,800 deg. F., followed by the application of water for one minute on the outside and two minutes on the inside. The following is a summary of what happened:—The internal boarding was completely destroyed. The slag wool was fused and blackened on the inside face and a narrow strip down the side of each stud was blackened; it was damp from the water applied, but otherwise good and clean. The studs were burned about $\frac{3}{4}$ in. deep on the inner edge, the wire-netting was sound and not loose, and the studs were sound, white and clean for a distance of $2\frac{3}{4}$ in. from the outer edge. The outside boarding was sound, white and clean, both on the fire and passage side. The fire did not pass through the partition. The temperature on the face of the partition next to the passage remained the same during the test. The following are the arrangements of the British Fire Prevention Committee for May. To-day the tests will comprise partition tests between matchboarded partitions of non-flammable wood and ordinary wood. Other tests during the month will include investigations with a "Mack" partition by Messrs. King and Co., and with another partition by the Fireproof Partition Syndicate, as well as several tests with doors and a fire blind; whilst a number of private experiments will also be undertaken. Reports will shortly be issued on a floor of wood joists with concrete filling and a match-boarded ceiling; and one of wood joists with concrete filling and plaster ceiling on expanded metal lathing. Reports will also be issued on a test with a floor by the Mural and Decorations Syndicate, Limited, some fire screens by Mr. R. Bugge, and a number of doors constructed in three thicknesses of deal, oak and teak. It will thus be seen that the Committee's programme this month includes a considerable amount of work. Regarding the question of obtaining some international basis for tests with fire-resisting materials with a view to arriving at comparative results, there are still considerable difficulties in the way. Mr. Edwin O. Sachs, the Chairman of the Committee, who has been inspecting, by invitation, the new Government fire-testing grounds at Berlin, finds that the proposed assimilation of the testing arrangements is the more difficult as the plant and methods of the Committee

are so far in advance of anything to be found on the Continent, where this form of research work is still carried on in a very incomplete and primitive manner. It is, however, to be hoped that in some of the technical details, such as measurements, recording temperatures, &c., the metric system and the centigrade system can be shortly adopted by the Committee, together with the usual figuring in feet and Fahrenheit.

SURVEYORS' INSTITUTION.

ANNUAL CONFERENCE AT LEEDS.

ON Wednesday last the annual conference of the members of the Surveyors' Institution was opened in the Council Chamber of the Leeds Town Hall. There were present

CHIMNEYPIECE AT THE SWAN INN, KNOTTINGLEY.

more than 100 members from various parts of the country. This Institution was incorporated by Royal Charter in 1881, and now has a membership of 3,100 Fellows, Associates and students, so that it is one of the largest professional societies in the United Kingdom. It has been invested with powers under various London Building Acts for many years past,

ENTRANCE GATES TO THE OLD HALL, KNOWSTHORPE.

and its leading members are frequently called upon to discharge important public functions in connection with Royal Commissions and Committees of both Houses of Parliament. Besides this members of the Institution are responsible for the management of nearly all the landed estates in England, as well as most of the great urban estates throughout the country. The Institution has erected a new building in Great George Street, Westminster, at a cost of nearly £40,000. Prior to three years ago its meetings were all held in London, but it was then determined to pay occasional visits to the provinces, and already successful gatherings have taken place at Manchester and Bristol.

An admirable feature of last week's proceedings was an exhibition in one of the rooms of the Town Hall of old plans, books, photographs, &c., relating to old Leeds, and showing the development of the city. It was arranged by Mr. Hepper, whose paper suggested the appropriateness of such an exhibition, and it was arranged so that the visitors might form some idea not only of the Leeds of the present but of the past. The Thoresby illustrated volume, recently purchased by the Leeds Corporation for £175, was on view. There were also some very interesting views of old Leeds, plans of buildings long since demolished, two views showing the elevation of both sides of Boar Lane before any street improvements were effected; a valuable book of plans of the Free School, Leeds, dated 1792; and views of Kirkstall Abbey, the old parish church, and other features of Leeds.

In welcoming the delegates, the Lord Mayor (Alderman Gordon) said the Corporation of Leeds recognised the importance of the profession in which their visitors sought employment. They knew from their own local experience how complicated and intricate the work often was with which surveyors had to deal. They also knew that, although the profession was an accurate one when it came to measurements and questions of that description, in many respects it was vastly a matter of opinion, especially when it came to a question of value. They knew how vastly surveyors could differ in their views upon the question of value, but they were also aware it was quite impossible for a man to rise to eminence in his profession unless he possessed a very strong will and a very high character, so that he might be unmoved in his views either by fear, favour, or even by fees. They also felt that probably no city in the kingdom of similar size was doing so much for surveyors as Leeds. People said several surveyors if they were not making their fortunes ought to be, by reason of the vast enterprises in which Leeds was engaged. Personally he was pleased and proud to welcome the members of the Institution, and hoped their gathering would be an immense success. The president returned thanks to the Lord Mayor, as representing the Corporation, and the business of the meeting was then commenced.

Old and New Leeds.

Mr. John Hepper, of Leeds, contributed the first paper, in which he dealt with the past and present history of Leeds. He pointed out that Leeds was described in the Domesday Book as having been a farming village in 1080, and then traced the various charters and gradual progress of Leeds down to 1893, when Queen Victoria, by her Royal charter, conferred upon the borough the title of "city." The superficial area of the city is now 21,572 acres, and the circumference thirty-one miles. "The city is almost entirely freehold," said Mr. Hepper, "and the instances of copyhold and leasehold and of freehold ground rents are so infrequent that we are sometimes in danger of overlooking them, and so unpopular are they that building societies and mortgagees are chary of lending upon them, and buyers discount them." Mr. Hepper next placed before his hearers some statistics to enable them to obtain a grasp of the progress and possibilities of the city, and enumerated the undertakings which the Council had under its control.

The rapid growth of the city had rendered necessary street improvements, transformation

of localities, and rebuilding to an extent previously unknown in its history. So far as street improvements were concerned, it was satisfactory to know that the plan of buying a greater depth than was actually required for dedication to the public user had had successful results; indeed, in one case, Vicar Lane, where the width had been increased from about 29ft. average to 75ft., the surplus land resold had almost recouped the great cost of the improvement, and a similar result seemed likely to accrue in other instances, without taking into account the enhanced ratable value which the improvements would occasion. The city improvements had in recent years been undertaken on a bold scale and with despatch, a matter of great importance to public convenience, minimising cost, ensuring larger returns of capital, enabling a quicker settlement of localities, and the earlier creation of ratable value. He had witnessed all the public improvements in Leeds for nearly fifty years—some executed in a tardy, niggardly spirit, others without a just appreciation of the immense potentialities of the city, and latterly with an enterprise and breadth of view which were conferring great benefit, with the result that business premises everywhere were being enhanced in appearance and generally in value, and were becoming more consistent with the requirements of a wealthier and better-educated population than that of former days. Of all the methods he had seen, he most approved, and heartily commended, the vigorous and broad-minded method now obtaining in the city, which he hoped would be continued on even grander lines for some years to come.

Back-to-Back Houses.

Dealing next with the subject of sanitation, Mr. Hepper showed the immense amount of work which had been done in this direction of recent years, and explained that the Leeds Corporation was now engaged in acquiring the property of an insanitary area of about 16½ acres on the east side of the city, which would probably cost £200,000 more than could be realised by resale, unless more than was at present intended were devoted to business uses. It was occupied by a population of about 3,800, for 2,000 of which it was expected provision would have to be made on the cleared area. The Board of Trade regulations did not allow back-to-back houses, which were so prevalent and popular in Leeds; blocks in flats on the London principle were contrary to Yorkshire habits and predilections. Upon the land at such prices as the Corporation was likely to want, and with such conditions as it would probably impose, speculators would not be able profitably to build; philanthropists did not seem inclined to venture on the field; the Corporation was unwilling to engage in a great building scheme; investors objected to public money competing with private capital; the people displaced were mostly poor and unable to pay the increased rents which would be required, and groaned at the hardship of being removed from their old haunts and contiguity to their spheres of work; and it was foreseen that the overcrowding of neighbouring districts would create other areas as insanitary as that from which they would be expelled. "I hope," said Mr. Hepper, "our Corporation will see how necessary it is in framing future by-laws to insist that streets in which back-to-back houses are to be built shall be more than 36ft. wide, or, better still, that they shall be 36ft. wide with a 6ft. area on each side, so that the houses shall be further apart and have more privacy than they possess when abutting upon the causeway. Of course, the effect of this will be not so much to increase the rent as to reduce the price which the landowner will receive for his land; and it seems to me that the increment of value to the land caused by the increase of population should not go altogether to the land-owner, but that some of it should be shared by the people in the form of increased open space, so that they may have more sun, more air, more room for movement, and so have better and more healthy conditions of life." The

death-rate for 1899, Mr. Hepper pointed out, was 19.1 per 1,000, or less than Edinburgh, London, Birmingham, Sheffield, Manchester, Liverpool, Glasgow, or Dublin. That which did so much to ensure the stability of Leeds and its freedom from sudden collapses of trade and employment was the large number and variety of influential manufactures which it possessed, and which kept all families more or less employed.

The cordial thanks of the members were passed to Mr. Hepper on the motion of Mr. W. J. Clutton, York, seconded by Mr. A. M. Fowler, Manchester.

Later in the day Mr. Hepper said many members of the Institution had spoken to him on the subject of the back-to-back houses in Leeds. Unless an Act of Parliament compelled them to withdraw them, he believed they would be compelled by the people to go on building them, as they were useful, healthy and cheap. Mr. Fowler said he was thoroughly convinced that the artisans' dwellings as now constructed in London and elsewhere were a great mistake. They were rookeries in the strict sense of the word. Having been engineer for Leeds for several years, he was thoroughly acquainted with back-to-back houses, and he was strongly of opinion that these were much preferable to the so-called artisans' dwellings elsewhere.

Nuisances and Sewage Purification.

Mr. Arnold Statham, barrister-at-law, contributed an exhaustive paper on "Nuisances and Noxious Trades." It was a résumé of the law relating to those manufacturing industries and trade operations which either vitiate the atmosphere, disturb the serenity, pollute the water supply, or otherwise invade the right of private individuals or the public to live or co-exist under conditions where they shall be free from molestation or annoyance. Whatever pride or interest they as professional men took in the interests of their respective clients who were seeking to expand their manufactories, they must not lose sight of the fact that they had other larger interests to consider, namely, to safeguard as far as possible the towns and cities of the United Kingdom from becoming little hells upon earth, and to the best of their humble ability to preserve untainted currents of air in public thoroughfares and unpolluted currents of water in urban watercourses, bearing in mind that if they were too freely sacrificed in the interests of the private manufacturer the British manufacturing products, of which they were all so justly proud, might be a curse instead of a blessing to humanity.

In the course of a discussion on the paper, the question of the purification of sewage came under review. The treatment of trade effluents, Mr. A. M. Fowler (Manchester) said, was becoming a very serious question. There were twenty methods of treatment which would purify sewage, but the cost of purifying and making the effluents passable into the river, to satisfy any Rivers Board, was so enormous in its cost, as Leeds found out in their early troubles, that it was simply beyond all reasonable means to carry such work out. Mr. J. H. Hanson (Huddersfield) said £300,000 was the very least sum that it would cost the manufacturers of the West Riding who were not connected with public sewers to deal with their trade waters. If the question of dealing with trade waters was to be carried out, it should be dealt with, first of all, through the law. All should be put upon one footing. If the manufacturer was to deal with his own trade waters, his mill premises, as such, ought not to be rated for treatment of domestic sewage. Mr. T. Blashill (London) said if a man could not get rid of his refuse, then it struck him that the site was not a fit one for a factory. But what were chemists for, if they were not able to devise some means of dealing with those waste products.

The members of the Institution and friends dined at the Hôtel Métropole, Leeds, on Wednesday evening. Nearly 120 gentlemen sat down to dinner, the president (Mr. Rickman) occupying the chair. The next day was devoted to excursions in the neighbourhood of Leeds.

ARCHITECTURAL ASSOCIATION.

COLOUR DECORATION.

By J. D. CRACE AND GERALD MOIRA.

A MEETING of the Architectural Association was held last Friday evening at No. 9, Conduit Street, Regent Street, W.; Mr. G. H. Fellowes Prynne, president, in the chair. The minutes having been read and confirmed, Mr. G. B. Carvill, hon. secretary, announced that the annual soirée of the association would be held on Thursday evening, May 10th, at 8 p.m., for which a play has been specially written by Mr. F. Dare Clapham, and music composed by Mr. Leonard Butler. The programme will also be given on the Wednesday evening for the special benefit of ladies. On his proposition a vote of thanks was then accorded to Mr. A. T. Bolton for presenting a bound copy of his paper on "The Dome as the Basis of an Architectural System," recently delivered before the association. Mr. Carvill then announced that the first meeting of the water-colour class would be held on May 12th, and that Mr. Forbes had been appointed successor to Mr. A. W. Weedon, who was unable to continue his position. Mr. J. D. Crace then read his paper on

"The Coloured Interior Decoration of Architecture."

as follows:—

When so large a subject has to be dealt with in so short a time it is necessary to select some one section or principle to which particular attention may be called, and in looking round to make such selection I find one upon which I have often laid stress before and which cannot be too often insisted on with regard to decoration. I mean its subservient relation to architecture; its duty of respect to the architecture it is to adorn.

Let us for a time put aside the average dwelling room with no features that can be classed as architecture. Colour can do much for it—can give it character, can give it proportion, and can make it lovely or unlovely; but the result after all is a matter which concerns only the owner and the decorator. They can try what experiments they are inclined to, or what fads they fancy, and they do no man wrong. If the result pleases their friends they have their reward; and if it does not they will be satisfied that this is due to want of culture in their friends.

But it is quite another matter if the building under treatment has other than domestic functions, or has received from its author some definite architectural expression—that is to say, bears some stamp of another man's thought.

When this is the case, it becomes the decorators' business to study that evidence of thought and to endeavour to enhance its value. In pursuit of this intention he has first to try to ascertain what lines or what features are really of the first importance in expressing structure and proportion. If he can find these he must never lose sight of them, for these are the features or lines with which nothing else must interfere.

However varied or however rich the decorative detail of the whole may be the final result of the coloured decoration of architecture should be lucidity of expression, and this is only to be obtained by allowing the due proportion of expression to each feature which has a place in the ideal scheme of structure. If such expression is really in due proportion, repose—that great element of beauty in all art, but most of all in architecture—is produced. For what is it that produces "repose" in art? It is the immediate satisfying of the mind's instinctive search for something; and in architecture that something is stability. Now, this stability which the eye and mind demand is not one of which scientific or practical evidence need be forthcoming. It is that of which an instantaneous conviction is borne to the mind by the continuity of suggested lines of strength in reasonable proportion to each other. And it is these lines of suggested strength which colour may do so

much to explain or to confuse. Nor is the explanation altogether so simple a matter. It is as harmful to over-accentuate any of them as to confuse them. The expression of each part must be relative. To exceed the due proportion of expression in any part is to disturb the balance. Blatant expression in colour is like shouting one's own language in the ear of a foreigner; it does not make things clear, and probably gives offence.

Another point which it is desirable to mention, because it is the subject of frequent misconception, is that lucidity of expression does not depend on the use or omission of detail. The most elaborate and delicate detail is compatible with perfect lucidity.

The one necessary thing in using ornamental detail is to take care that it does not interfere with the main scheme. Used with proper skill and knowledge, it should be able to assist materially in its development. On the one hand, it should assist to explain surface or to accentuate line; on the other, it is invaluable as a means of lowering tone and softening effect, without sacrificing purity of the individual colours. Further, it facilitates harmony by giving the opportunity of small "recalls" of colour—of importing, as it were, fragments of one colour into the field of another—one of the most essential conditions of complete success in harmony. This should be carefully noticed by students in examining the pictures of the best masters.

I have said just now that it is the first function of colour, when used in architecture, to assist in producing that "repose" which results from an instantaneous impression of stability. This means that the eye must be encouraged to recognise at a glance such features and proportions as indicate or suggest well-balanced structure, whether that be expressed in the architecture or not; for it must, and in fact does, often happen that structure is not outwardly expressed—at any rate, not to the extent that allows instantaneous conviction of its sufficiency. A flat ceiling is one example. In such cases colour steps in and suggests constructive lines of some sort, which, though they have possibly no relation to the actual invisible structure, suffice to satisfy the eye in a moment as to the balance and stability of the surface, on which it must otherwise have hesitated in doubt. Moreover, lines of some kind are indispensable to assist the eye and mind to travel over the surface of the building; and, whether by mouldings or by colour, it is the disposition of these lines upon which depends the impression of "repose." If simple, and suggesting the relation of one part to another, the eye grasps the meaning quickly and is at rest.

But if the lines expressed (whether by mouldings or colours) are inconsequent, purposeless, and without proportion, the eye becomes puzzled, restless, and dissatisfied. The eye demands a clear path, not a broken wilderness.

To touch on another branch of decoration, and a most important one, the use of pictorial art in connection with architecture. We are accustomed to hear the most transcendental talk over the idealism or symbolism of the subjects to be painted in this or that building. I am far from underrating the value of this quality in art. What I want to point out is that it is the building, as a whole, if it be a worthy building, which first has to be considered, and that it is the form, the tone, and the treatment or style that affect the building, not the "subject." For the harmony of the building it would not matter a jot whether the subject were "Cupid and Psyche" or "Moses in the Bulrushes."

But it may ruin the whole effect if the picture is in a badly proportioned panel, painted in too cold a key, or executed in a style too crude or too complicated for its surroundings. Not one in fifty of even very able English painters has been trained to look at art from this side, or to consider the necessity of keeping the whole tone of his own work in relation to the decorative result in the whole building. Look at the paintings in the Royal Exchange. Not one, or perhaps but one, is in tone with its surroundings; nor any two in tone with each other. I regret this

the more because I first suggested, in a report to the Gresham Committee dated October 9th, 1890, that these panels should be painted historically.

Undoubtedly painting in the studio instead of on the wall itself tends to enlarge the risk of want of harmony with the whole surroundings, though it certainly presents some advantages. To take one disadvantage alone, the difference of light; this is almost certain to be different in degree and quality, and more than likely to differ in direction. This being the case, there is only too much probability of a general difference of tone between the picture and its surroundings when finally brought together. Even the design or cartoon of the picture—colour apart—will often need some change, when tried on the spot, from what seemed satisfactory when viewed in the studio.

The coloured bands or margins, which in coloured decoration are so valuable, are more than ever useful when pictorial treatment is adopted in the panels. They afford the means of connecting the more forcible colouring of the picture panels with the rest of the work, and so preventing them from appearing as detached patches.

Apart from this function, they greatly facilitate and direct the passage of the spectator's eye over the whole work, and aid that prompt grasp of form and surface which I have already spoken of as inducing the sense of repose.

The matters which I have mentioned are practically "axioms" which are absolutely independent of style or fashion. The building may be ecclesiastical or secular, Classic or Gothic, simple or elaborate; it matters not. The general principles which should guide decoration are true for all. And it is this main point which it seems useful now to insist upon, because we find so many persons ready to substitute particular arrangements of colour or pattern for any real knowledge of art or principles.

Be sure of this, that just as sound principles are independent of style or fashion, of any special harmonies of colour or of any character of design, so no design, no arrangement of colour, no excellence of skill, can really enhance the value of the architect's work if the decorator does not carefully think out and follow those immutable principles which, whilst they allow of an infinite variety of treatment, have for their base the expression of the repose and stability of the architecture.

Mr. Gerald Moira then read his paper on

"Colour Decoration"

as follows:—In dealing with a subject like the one we have before us this evening is a very difficult matter, as there is always so much to say and equally so little. Decoration is a thing about which everybody from the very earliest period has had something to say, and, therefore, as there is nothing new under the sun, I am afraid nothing new will come from me; but, as you have kindly asked me to speak on this subject, I will endeavour to give you my ideas. There are one or two points I would like to put forward, especially about outside decoration, and more so about outside colour decoration, about which I feel very strongly.

Firstly, let us take the Greek work. I do not think it is necessary to go further back. Take the Parthenon, for instance; it was a great marble edifice. Now, the frieze round the building was in low relief and—I think I am right in saying—was coloured. And I fancy the capitals of the columns were also coloured or gilded, and that colour as an enrichment was, no doubt, used on other parts of the external ornament. If I knew more about the building, or as much as some of us present, I could tell you exactly what parts were coloured; but that is not what I want to point out at present. What I want to point out and what we want to know is—was the result when new a success? I say when new, as we all know what a delightful painter Old Time was and always will be. Well, was the result a success when new? I think it must have been, and principally why I think so is because of the glorious climate and perpetual sunshine, and that perpetual sunshine and clear atmos-

phere wants colour. You may be surprised to hear me say this, but I feel I am right. Why? Because the shadows are so cold, the sunlight so dazzlingly white, that there is practically nothing of variety of colour in the noon-day heat. As we all know it is only when we feel hot in the sunshine that we know it is hot, by that I mean the more dazzling the sun the more deadly white the building becomes and the more uncompromisingly blue the shadows are; the sky one expanse of pitiless azure, the trees in the landscape one uniform blackish green, and even the earth a parched grey monotony. Well, all this is cold in colour, is it not? and the old Greeks took this into consideration and recognised it, and I am certain that is why they put colour on their buildings. Do not think I am running down the sunshine; I am only trying to point out that where there is no cloud (and therefore scarcely any atmosphere) the less colour the landscape has. That is my reason for believing that the buildings required colour. If we come a little further north we see less colour on buildings, and when we do see it, it is not quite successful. Why? Because nature has more colour in it, and, therefore, a white building with a zinc roof comes as a relief. In the latitudes that embrace the greater part of Northern Europe we do not find so much colour outside buildings; but, again, higher up towards the Arctic, your coloured wooden reliefs have been and I believe are still used. This is no doubt for the same reason, only in this case it is the perpetual snow that requires relief. In medieval Italy, Spain, Portugal, Southern France, and even in Southern Germany, we find a great deal of colour, especially in Italy and the Peninsular. I attribute this to the Church as much as to the sun. The reason I do so is because the Roman Catholic Church has so many holidays and feast days. On those days the people come out in their best garments, and these best garments were always bright, nay, brilliant in colour, and then the art world of the day found that grey and white buildings did not suit so much bright colour, they wanted a note of it somewhere, and it was this that led to such buildings as Venice possesses, and to some in Spain and Portugal that one could no doubt name. Even in the present day the people of those countries do not look amiss because they are still in a great measure a holiday-making people in an everlasting sunshine. We in work-a-day England do not get much sun and precious few holidays, and therefore do very little else but work. Our wearing apparel naturally becomes natural tint, and as such we could not stand our buildings being highly coloured, they would be out of key. It is the commonplace things that have their effect even on art. It is the man's mode of living that rules his household, and a nation's mode of life that rules everything around it, and it is necessity that rules the world. Had I said this in the beginning, I need not have troubled you all this time. These are my ideas why colour was used on the outside of buildings. The inside is different and is therefore more uniform all over the world; that is, the same amount of colour and same treatment can be used in the north as in the south. Of course, one finds places that ought to have been decorated left undecorated, and *vice versa*; but this sort of thing is sometimes unavoidable. Take a church, for instance, that has been decorated in this period and in that from time to time. It looks well—at least, it hangs together. I believe it is dirt that does it, because it is the most dangerous thing to put a new painting or mosaic in an old building. Why? Because they are out of tone. The former has the best chance, as it will go down, but will not look well for at least half a century. The latter, like all materials that have a glazed surface, has no chance in a stone building, old or new, and therefore ought not to be used. It will remain blatant and bright for hundreds of years when the stonework around it is becoming yearly more toned down and mellowed. When we see an old church abroad that perhaps may have the roof painted some hundred or so years after it was built the man who painted the roof made no attempt to keep his work in the same style as the architecture, but to-day it looks

well, taking for granted that the man who painted it was an artist. Now that brings us to two questions: the first one is, "What is Style?"—the second, "Do we work for to-day or for the time to come?" Firstly, to my mind too much is thought and said about style to-day. An architect comes to the painter and says I have a Gothic building and want some Gothic decoration for such and such a part. Now that seems to me ridiculous; to start with, I don't believe the building is Gothic. We live in the twentieth century and when Gothic art flourished railway trains and quick-firing guns and a thousand and one other things did not exist, and all these things help to influence the Gothic building of to-day. It may be exactly right in proportion, even down to the very smallest moulding, but it won't have the spirit of the Gothic times. This is not quite the architect's fault, though, perhaps, he ought not to have tried it; the fault lies as much with the men he is obliged to employ, the stonemason and so on who only work with their hands, and whose one idea is either the dinner-bell or the bell for knocking off work. And it is the influence of the present-day times that prevents an architect being able to procure from the painter a Gothic decoration. The painter may be able to paint knights on horseback and saints in a way that perhaps to-day look mediæval, but in fifty or eighty years' time they will say, "There is one of those queer things painted at the end of the last century, which in those days was supposed to be quite mediæval," and to us now what was built sixty years ago and looked upon as pure Gothic, to-day we call it Early Wesleyan or Victorian and Albert, and there is every reason that in another sixty to-day's Gothic will be put down to to-day. So to my mind it makes very little difference in painting a decoration for the said Gothic building whether you dress your figures in the costume of the Gothic period or in the clothes of to-day. In fact, to-day's garments would be more honest and more in keeping with it, and if such a work be done by an artist it will keep its place and will look well for ever. I think the last words answer the second question. I have only said Gothic for the sake of a name.

I have just returned from Paris and while I was there I went to most of their public buildings that have been so lavishly decorated with great frescoes within the last thirty years, and I came still more to the conclusion that they have had one great decorator, Puvis de Chavannes. He was a man who thoroughly understood that his decoration was to be part of the building it was to be placed in, and he always regarded the wall he was dealing with as the flat surface it is, and in this way preserved the architectural features and the proportions of the buildings; and these are the points that go make a great artist. The rest of the men who have covered large walls in such buildings as the Panthéon and the Hôtel de Ville have had nothing else in their minds, it seems, but to do a *tour de force*, a thing that in some instances it is impossible to be in the same room with. One I remember very well; it was a ceiling with rolling clouds and blue sky, on which some cavaliers and ladies are dancing a minuet or something of the sort. To begin with, I should say it would be a most uncomfortable thing to dance on, leaving alone that it entirely throws the proportion of the room out, as it makes the ceiling an indefinite height. This is the style of work that makes architects very chary of giving decorative work, and goes to show that a man may be a very good portrait painter or landscape man, who has no idea of the qualities that go to make a decorator.

There also seems to me to be a common misunderstanding as to what is true decorative painting. The art of painting embraces three distinct styles: firstly, the purely pictorial or the representation of Nature in colour—realism; secondly, the decorative picture; and lastly, decoration pure and simple. We need not deal with the first or realistic style, but I think we should arrive at a definite comprehension of the difference between the two latter forms of painting, for I imagine that it is owing to this lack of understanding that much so-called decoration at the present time fails

in its intention. A picture is complete in itself, and has nothing whatever to do with its surroundings. This is proven by the fact that it is possible, with no worse effect than a bad headache, for one to go to an exhibition where some hundreds of pictures are jumbled together, each having not the slightest relation to each other, but no one has ever suggested that such treatment of a wall as employed, say at the Royal Academy, is a successful form of decoration. It is necessary for one to lay stress on this point to prove what I wish. The decorative picture, however good in itself, remains always a picture. And, as if by instinct, the artist feels himself when painting it more trammelled than he ought to be when engaged in decorative art. He takes, perhaps, an historical scene, and treats it in however peculiar a way he may feel. He may be a Burne-Jones, Rossetti, Ford Maddox Brown, Leighton, or any similar stylist, but the mere fact of his having to deal with a piece of canvas having no ultimate relation to any particular site, instinctive conventions, be he conscious of them or not, will cramp his power and for ever prevent his creating other than a decoratively pictorial effect, however fine in its way. It is, I conceive, hardly possible for a picture painter to break these bounds, try as he may (the only notable instances are perhaps the finest Japanese prints), and this, I feel, shows that a picture can never be successfully hung except on an easel, apart from anything else, and not placed to ornament a wall which it was never designed to decorate. A true decoration should be absolutely a decoration, and nothing else. That is to say, it should be the most appropriate enrichment of the space requiring it. That is what I meant when I said what I have of Puvis de Chavannes' work. Hence it is agreed that in *method* as well as in intention there should be little or nothing in common between the picture and the applied decoration. The best realism is that which, amongst other things, suggests atmosphere. In mural decoration the absence of any sense of atmosphere is its finest quality. There should be neither atmosphere nor any forced perspective to mar the effect of flatness, which should be the first aim. The wall is a constructional flat plane, and nothing should be done on it which will create an illusion that it is not flat. One has seen decorations painted on walls which give the idea that the painter had objected to the wall, and desired that the weight overhead should be supported by a hole through which one saw some scene or landscape, and this error was found by the analytical eye to be more or less entirely due to the introduction of atmospheric and perspective effects in the painting. Such work could never be accepted as true decoration, and the bare wall in these cases would better satisfy the eye of anyone who had the slightest education in architecture and its demands than any such painting, however clever in paint technique or strong in colour and subject. The Sistine Chapel painting, by Michel Angelo, certainly one of the finest accepted works of its kind, loses greatly, to my mind, by the introduction of violent perspectives and shadows, which destroy the flatness of the spaces, and cast a blemish on otherwise perfect work.

The decorative painter should find himself less trammelled than in any other branch of the art, yet one seldom finds that the opportunities afforded are made use of or even realised at all. He has, of course, certain rules and conditions to conform to, such as uniform scale, etc., but in the main he is a free agent. While he should conform to the laws of nature, he is not bound by nature in the photographic sense. The old sculptors and painters went to nature for their foliage, and yet each one in translation impressed his own individuality to a very marked extent, so that we find a large number of carvings and decorations by different men of, say, the vine-leaf, yet while each one is totally different in treatment to the next, they are all undoubtedly vine leaves. And here let me remark that in every case the spirit of the age—the date of the work—is indelibly marked. So it should be now and in the future. The decoration, no matter what subject or however

treated, should be contemporary in feeling. It is quite a false idea to imagine the twentieth century artist can possibly feel and work with the intention of the fifteenth-century painter. We live under entirely different conditions, and we must work in sincerity to our feelings if we wish to do honest and convincing work. I hope I have expressed what I mean by the few limitations only which are set to the decorative painter. For the rest, he has an entirely free hand to evolve beautiful shapes and use the richest schemes of colour, while his choice of subjects is seldom limited by conditions which render them impossible for the pictorial painter to translate into paint. A good design, first of all, should be the object of the decorator—fine line, happy placing, big masses, and equally fine empty spaces. Then the treatment of his figures, draperies, and accessories with beautiful outlines. For outlines form one of the chief difficulties and are one of the most important features in decoration. The realist may lose an outline here and there to a mere impression, but the decorative painter has to deal with hard-and-fast outlines, which the absence of atmosphere insists on. It is in this respect that I quarrel with what I term the pictorial decorators, and there are unfortunately many such who are engaged on buildings at this present time. Another error I think is to imagine that a richer decorative effect is obtainable by the employment of an intense, high-pitched key of colour. There can only be one really successful scheme for each one particular place, and it is the first object of the artist to discover what that is, what style of work, what scale of drawing, and what scheme and key of colour. This is where careful study and training as much as natural instincts will tell. For the rest it is not for me to say anything of my own methods; I doubt if I could. I have contented myself with dealing as far as possible with the main question as to what will and what will not lead to a successful decorative effect.

A discussion followed.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

R.I.B.A. Preliminary Examinations.

BRECHIN CASTLE.—THE DUFFER writes: "What is the usual age for those entering for the probationers' examination at the R.I.B.A.?"

The R.I.B.A. preliminary examination is usually taken at the first opportunity after entering an architect's office—that is, between sixteen and eighteen years of age.

G. A. T. M.

Book on Clerks of Works' Duties.

No Address—? PRETORIA.—KRUGER writes: "Kindly let me know the name of any book or book's dealing in a clear and concise manner with the duties of a clerk of works."

"The Conduct of Building Work and the Duties of a Clerk of Works," by J. Leaning, price 2s., will give our correspondent all the particulars he wishes on this subject. It can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.

Sun-Prints.

IPSWICH.—TRANSPARENT writes: "I shall be glad to know of a simple, inexpensive and practical method of making an inked-in drawing transparent for sun-printing; also of another method for bringing back the drawing to its original state without injury."

It is necessary to make a tracing of the drawing, using a perfectly black ink and a transparent blue (not yellow) tinted tracing

paper. There is no method known of rendering opaque drawing paper sufficiently transparent for the purpose.

G. A. T. M.

French Architectural Journals.

OLDHAM.—X. writes: "I should be glad if you would name the best French architectural journal, either weekly or monthly, for an English architect to obtain."

LONDON, S.E.—R. A. writes: "I should feel much obliged if you could give me any information as to the best and most reliable French-English and English-French technical dictionary for the building trade, etc., and of whom it may be obtained."

The answer given on page 116 of our issue for March 21st last will, we think, give both of our correspondents the information they seek.

Mild Steel Stanchions.

RICHMOND.—P. R. S. writes: "I should be greatly obliged if you would tell me how to calculate the strength of mild steel stanchions of H-section."

The catalogue issued by Messrs. Dorman, Long and Co., Ltd., Middlesbrough, gives, at pp. 143 and 144, sections of various built-up stanchions and a table of the strength of rolled joists used as stanchions. They can also be calculated by Gordon's formula, viz,

$$R_e = \frac{A r_c}{l + a \left(\frac{l}{d}\right)^2} \text{ where } R_e = \text{safe resistance to}$$

compression of the pillar in tons; A = area of cross section in square inches; r_c = safe resistance to compression of the material per square inch; l = length of pillar in inches; d = least diameter of the cross section; a = constant deduced from experiments on the actual breaking of long columns.

$$\text{Both ends fixed} \quad \dots \quad a = \frac{1}{2500}$$

$$\text{Do. rounded} \quad \dots \quad a = \frac{4}{2500}$$

$$\text{One end rounded, other fixed,} \quad a = \frac{1}{1000}$$

It is usual to calculate stanchions as having both ends fixed. HENRY ADAMS.

Whiting Falling off Ceilings.

STAFFORD.—F. E. AND SONS write: "What would you recommend to prevent whiting falling off ceilings? We believe that when the plastering was done, some four years ago, salt-water was used. The ceilings have been whitened three times, always being well washed off and first given one coat of strong preparation. The whiting commences to fall off after being done about eight weeks, and continues to do so until the ceilings are perfectly bare."

Doubtless the cause of the whiting falling off the ceilings is due to saline matter in the plasterwork. The most effectual remedy would be obtained by stripping the existing plaster, and replastering with carefully prepared coarse stuff and setting stuff, gauging both with good coarse plaster to save time in waiting for the various coats to dry. A quicker way is to use fibrous slabs, which are nailed on to the joists, and the surface finished then with a thin coat of gauged putty lime or setting stuff. Parian cement may also be used for the finishing coat. Finished face fibrous slabs may also be used on the joists, and, as indicated by their name, no setting coat is required. If they are carefully fixed, and the joints stopped, the surface can be distempered soon after the slabs are fixed. If it is undesirable to replaster the ceilings, wash them thoroughly, and after they are perfectly dry paper them with strong paper, or give them one coat of good oil paint, and then whitewash them in the ordinary way.

W. MILLAR.

Finishing Coloured Cement Work.

DUNDALK.—COLOUR writes: "I should be glad to have some information on finishing coloured cement work. It is specified to be brought smooth with a trowel in a finishing

coat about $\frac{3}{16}$ in. thick in imitation of red terra-cotta. I once saw a finishing coat evenly mottled with black particles and brought to a good polished surface. How can the mouldings and stop-chamfers, etc., be finished with this polished surface?"

Float the surface in the usual way, using the cement and aggregate in their natural colours, as colouring matter is too expensive if used for the whole thickness; besides, it has no effect on the final coat, technically termed the "fining." The colouring matter must be thoroughly mixed with the cement before gauging with water. The finer the colouring matter and the cement the finer the surface and uniformity of colour. Use metallic oxides for the colouring, earthy colours, like Venetian red and umber, soon fade and have an indefinite tint. The quantity of oxide to be added to the cement depends upon the strength of the oxide, as some are much stronger than others. Five per cent. of a strong oxide will impart a close resemblance of the desired colour to the fining coat, but a weak oxide will require from 10 to 15 per cent., and even 20 per cent. to obtain the same colour. Portland cements vary in their percentage of lime, and as an over-limed cement will require more oxide than an under-limed cement, therefore, in order to test the power of the oxide and the cement, it is a safe plan to try various proportions of colour and cement, and to gauge small parts, laying them on a smooth and impervious surface—such as glass—and when set and dry selecting those most suitable for the desired purpose. Some of the oxides range in colour from scarlet or Turkey red and gradually deepening to chocolate; so that a medium red oxide would be most suitable for the desired purpose. A black mottled surface may be obtained by gauging neat Portland cement, previously mixed with the black colouring matter, and then spreading or rolling the mass on a clean bench until about one-eighth thick, and when nearly set cutting the slab into small cubes, and allowing the whole to set. The coloured cubes are then mixed in due proportion with the coloured fining material, and then gauged and laid. Great care must be exercised in laying so that the cubes will not be broken, and also that they do not project beyond the finished line, otherwise if broken the mottled surface will be irregular, and if they project the trowelling off will be difficult. Another way is to first lay the red fining coat and then insert the black cubes by hand. In this case the cubes should be inserted while the stuff is quite stiff, but not set. This allows the both stuff, red and black, to be freely trowelled without fear of breaking the cubes. The trowelling must be carefully done, using little water, but simply wetting the trowel with a brush. Allow the work to stand until the external moisture has disappeared. Repeat this operation until the desired finish is obtained. Use matt cement, coloured as desired for running moulding, and if the running mould is cut true and smooth a fine finish will be obtained.

W. MILLAR.

Manchester Housing and Allotments Scheme.—A Local Government Board enquiry has been held into the application of the Manchester Corporation for power to borrow £36,000 to enable them to purchase 237 acres of land at Blackley for housing and allotment purposes.

Designs for Leeds Police Stations.—At a recent meeting of the Fire Brigade Sub-Committee of the Leeds Corporation the City Engineer (Mr. T. Hewson) stated that in view of the number of police stations that it was intended to erect in different districts of the city his staff could not give that personal attention to the work which he should like, and he suggested that plans should be obtained from outside architects. The Committee decided that in all future structures this course should be adopted. With regard to the Chapeltown and Dewsbury Road police stations, which will be the first to be proceeded with, it was resolved that competitive plans should be invited from Leeds architects.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Blessed is the man who has found his work."

—CARLYLE.

Our Inset Sheets.

THE screen for Seal Church, near Sevenoaks, in Kent, was designed by Mr. C. R. Ashbee, of Chelsea. It was constructed at the Guild of Handicraft, Essex House, Bow, E., and is meant to serve as a screen for the ringers in the tower. There are ironwork bars in the centre, surmounted at the junctions of the tracery with gilded bosses, the bars holding a dull-green glass, made for the screen by Powell, of Whitefriars.—The doorway illustrated is the principal entrance to the offices of a large limited company having premises in Old Street, E.C. The brickwork is in dark red salt-glazed bricks, and the stone is Portland; between is a deep cove in copper gold. Mr. H. V. Lanchester, of London, W.C., is the architect, and the sculpture has been executed by Mr. H. C. Fehr. Some particulars of Shakespeare's House will be found on page 235.

Improving Liverpool.

AT the present moment numerous street improvement schemes are being contemplated in Liverpool—perhaps there never have been so many before. Undoubtedly the most important of them is that connected with the George's Dock, a project which includes the filling-up of the dock, the carrying out of vast improvements in the approaches to the riverside by the continuation of Brunswick Street and Water Street to the Pierhead, and the doing away with that fruitful source of obstruction to vehicular traffic, including the tramway service, namely, the swing bridge over the entrance to the dock. And while considering the dock project, there is another improvement which seems to go hand in hand with it, if the river front is to be given that commanding appearance which the majority of people will agree ought to be obtained. Reference is made to the clearing away of the Goree Piazzas, which, while being practically an eyesore, are a great obstruction to the street traffic along the line of docks. Until these are removed, the improvement effected within the last twenty years in putting back the boundary wall of St. Nicholas' Churchyard and the demolition of certain buildings on the west side of what was then Prison Weint, remains incomplete. Passing from the George's Dock scheme reference may be made to the numerous improvements which it is desired to effect in the central portions of the city by the widening of thoroughfares at points where in many cases they are so narrow as to be a serious obstruction, and in fact a danger, to vehicular traffic. One of these schemes, which is to cost the city something like £100,000, is the widening of Berry Street and Renshaw Street, to meet the needs of the electric tram system. Nine other street improvements, rendered necessary by the introduction of electric traction in connection with the tramways, are included in the Bill now before Parliament, which it is expected will receive the Royal Assent in the course of a couple of months. The expenditure authorised by the Act for the purchase of lands and for the execution of the improvements is £280,000, of which more than one-half, or £150,000, will be swallowed up in carrying out that most necessary work of widening Scotland Road. The other improvements are too numerous to mention here, but enough has been said to show what changes the Liverpool Corporation proposes to make.

Italian Restoration Work.

MR. CHARLES L. EASTLAKE, writing to the "Times," from Perugia, says: "Much has been said from time to time by English critics respecting the injudicious character of architectural restorations in Italy. A few instances, perhaps, have furnished grounds for complaint. But there are

many others in which the necessary work has been executed with the utmost skill and fidelity. I have lately had an opportunity of re-examining that beautiful little example of Italian Gothic, the church of Santa Maria della Spina, on the Lung'Arno at Pisa, which some years ago was taken down in a dilapidated state and re-erected at a higher level, in order to protect it from the damp resulting from its original position. The task must have been a difficult one, but it has been admirably carried out. Not only has the masonry of the walls been replaced stone by stone in its proper site, but every fragment of the old carved work has been preserved and built in where it should be, while such small features as had entirely perished have been reproduced with an accuracy which should satisfy the most fastidious antiquary. Having drawn and measured the façade with most of its details more than thirty years ago, I gladly bear testimony to the excellence of this 'restoration' in Italy."

Ayr Town Hall.

IT is now about two years and a half since the Ayr Town Hall was burned down, and as it has not yet been rebuilt, a correspondent writes to a contemporary urging that the work should be proceeded with at once. The Town Council appear to be about equally divided as to the wisdom of rebuilding the hall in the old place, which was on an upper storey above two tiers of police cells, or building it apart from the municipal buildings on an entirely new site. A competition for plans was arranged for, and the strictest conditions were laid down as to limit of cost. Besides, the councillors who favoured putting the hall back in the old place have publicly pledged themselves that on no account shall one penny more than £9,500 be spent. Unfortunately, the Council limited the competition to local men, and also overlooked that the cost of building work since the old hall was burned has increased quite 35 per cent, and what could have been done for £10,000 two years ago will now cost about £14,000. Of the local architects, all but one withdrew from the competition, for one reason or another, but chiefly because the very stringent conditions as to cost foreshadowed the likelihood of the hall not being built at this time. The solitary plan was submitted to Messrs. Douglas, Hunter and Whitson, measurers, Glasgow, who estimated that to complete the buildings in a creditable manner would cost from £13,000 to £14,000. "Where now are the perplexed Town Council?" asks the correspondent. "They bring the only competitor and the measurer together, and try to talk the cost down, so that at any rate the building may be commenced even supposing the outlay ends at £15,000 and a shaky Common Good has to find the money." In reference to this letter another correspondent makes the suggestion that a smaller hall should be built on part of the same site, the remainder of the site being roofed in and used for municipal purposes.

A London Crypt.

AS has already been announced the crypt of St. John's, Clerkenwell, is to be restored. The crypt extends the whole length of the church, a plain building chiefly modern, but which stands upon the site of the choir of the church erected by the Knights of St. John of Jerusalem towards the end of the twelfth century. Of this building, however, little remains except the north and south walls and the fine crypt. The crypt is partly twelfth and partly thirteenth century work, and is the most important structure of its kind in London. It has been supposed that it formed the original church of the knights and was formerly above the ground level, but there are arguments against this theory. In the first place it has far more the proportions of a crypt than those of a church or chapel. The capitals of the columns or "responds" which support the vaulting are slightly below the level of the eye, which is very unusual in buildings erected above the ground level, and there does not seem to be any reason for supposing that the ground has risen to any remarkable extent in this neighbourhood. Fragments have also

been discovered of the bases of the upper building or church, which are of the same date (or nearly so) as the crypt itself. It is understood that the restoration will be strictly confined to necessary repairs, and that modern work will only be added where absolutely necessary. The upper church, as it now exists, is not interesting, and is mostly eighteenth and nineteenth century work. The nave has entirely disappeared.

Fearn Abbey Church, N.B.

THE Abbey of Fearn, which has just been restored, is one of the few pre-Reformation edifices in the north still in regular use for public worship. Originally it was erected by monks of the Præ-Monstratensian Order. A colony of these migrated in 1236 from a place now known as Mid-Fearn, in the parish of Edderton, to the present site of the Abbey of Fearn. The earliest buildings erected by them were of clay, but in 1337 a movement was begun for the erection of new buildings, which were completed in 1372. Subsequently to that date, additions were made in the shape of an aisle, known as St. Michael's Aisle, remains of which, containing a recumbent figure in stone of Finlay Macfaed, Abbot of Fearn from 1442 to 1485, still exist, as well as two memorial chapels built at a later date, one on the north, the other on the south side of the main building. These two chapels, though now roofless, might at no great cost be restored. In 1771 it was found that the new church, as it was then called, had become unsafe owing to the state of the roof and walls, and the heritors decided to use the material available from it for the repair of the old church. Since 1773 it has been the church of the parish. The present restoration has been undertaken in order to make the building more comfortable for the worshippers, and also with the view of restoring, as far as possible, the original architectural features of the church.

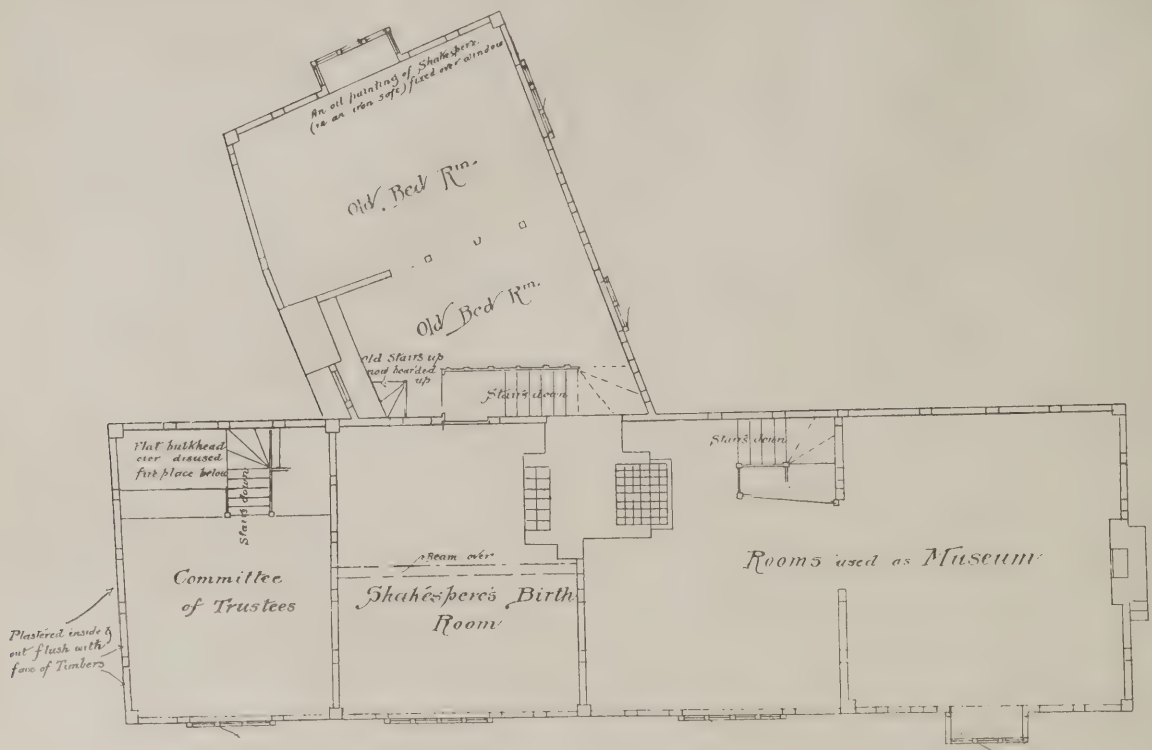

Joan of Arc's House.

DESPITE all protests, the municipal council of the City of Rouen have decided to destroy the house known as the "Maison Jeanne d'Arc," and to carry out further alterations in the Rue St. Romain (named after their city's patron saint) which will absolutely efface the picturesque and historical interest of this portion of the town. Since the fifteenth century these houses have given to the neighbourhood of the great cathedral its peculiar and distinctive charm, and the news of their demolition should appeal to every traveller in the most picturesque of northern French towns, and to every lover of the romantic past of English history. The houses that will now be pulled down have an intimate connection with our military history. They were standing when Henry V. starved Rouen into heroic submission. They were the dwelling places of most of the judges of Jeanne d'Arc. They sheltered also some of those workers in metal from Lorraine who originally lived within a few miles of the Maid's own Domrémy. The fatal passion for "alignment" has already ruined enough of the few ancient beauties that remain in modern cities. It is now rapidly destroying the whole meaning of the French cathedral architecture, an architecture which rose in springing lines from the houses that crowded round its closely decorated walls. But Rouen has still more claims upon our interest. It contains the only contemporary carving that exists of the Field of the Cloth of Gold. These invaluable records are peeling off the walls of the Maison Bourgtheroulde, and if the ediles of Rouen are bent on sacrificing the street that was under the protection of their own patron saint, we can scarcely hope that they will do anything to preserve a carving that is distinctively English in its associations, and that now forms part of the public courtyard of an estimable banking company. It is to be feared that nothing will save the house in question, though protests have been made from all directions, including one from our Royal Society of Antiquaries. Respect for beautiful old architectural work is fast dying out in a century of engineering novelties.

THE CITY OF OTTAWA.

THE inhabitants of Hull, a suburb of the city of Ottawa, the capital of the Dominion of Canada, which was destroyed by fire last week, number 12,000, and are there as the result of a settler named Wright building himself a house near the Chaudière, on the Ottawa River, towards the end of the last century. Ottawa was chosen as the administrative capital of Canada in 1858, and saw the assembling of the first Federal Parliament in 1865. Occupying a commanding position on the river—from which it takes its name—120 miles from its junction with the St. Lawrence at Montreal, Ottawa is nowadays a handsome, pleasant town, if it boasts no buildings of any extraordinary value from the architectural point of view. The most important of its public edifices are the Government Buildings, finely situated on Parliament Hill, looking over the broad river and distant scenery of much beauty. The foundation stone of this structure was laid by the Prince of Wales during his visit to Canada in 1860, and altogether, including the Library buildings and the Victoria Tower, 180ft. high, it constitutes a very handsome pile, the total cost of which amounted to more than £1,500,000. Other buildings of note are the Post Office, City Hall, and numerous banks, all of stone. The churches, too, are many. The Governor-General resides at Rideau Hall, an old-fashioned building of no architectural merits whatever, situated about a mile from the city. As one of the biggest centres of the lumber industry in the Dominion, it is not difficult to understand that a fire once started in Ottawa is likely to go far. All the lumber products of a huge stretch of country, extending as far as Lake Nipissing to the north-west, are carried down to Ottawa by means of the Ottawa River to the point at which the river forms the noble Chaudière Falls—these falls supplying the motive power for the numerous lumber mills, flour mills, factories, &c., along the banks of the river.

Gladstone Memorial at Liverpool.—

The new Gladstone Conservatory, erected by Mr. Henry Yates Thompson in Stanley Park, Liverpool, at a cost of £8,000, from the design of Mr. Bailie Mackenzie, of Edinburgh, was formerly opened on Monday in last week. The conservatory is 120ft. long and 50ft. wide.

SHAKESPEARE'S HOUSE.

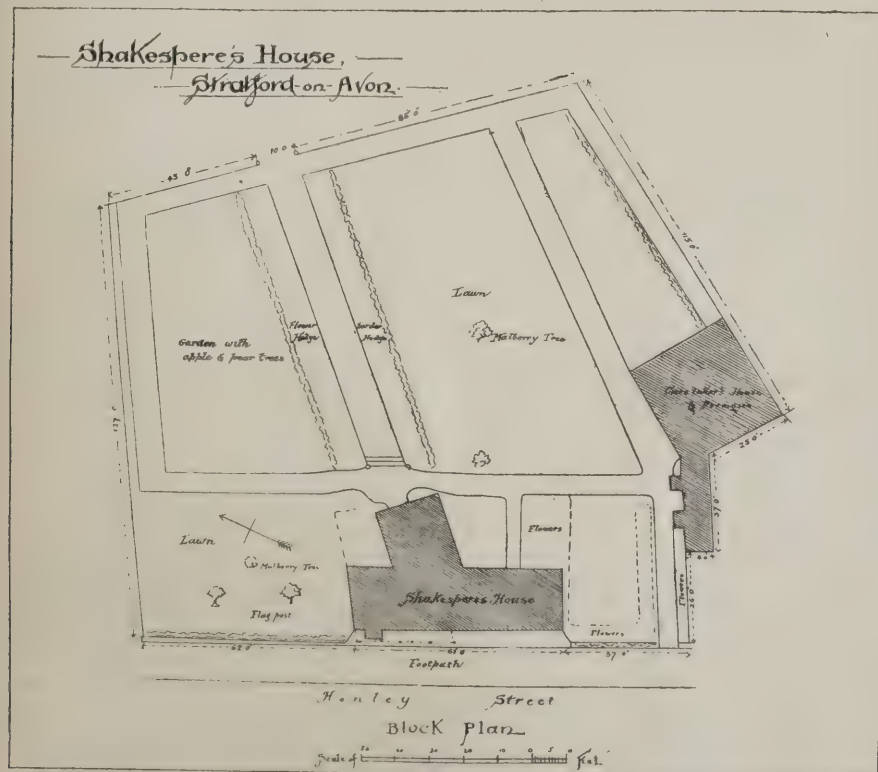

WE give on one of our inset sheets this week plans and elevations of the house at Stratford-on-Avon in which William Shakespeare was born (probably) on April 23rd, 1564, and on this page is shown a plan of the site. Most of the houses in Shakespeare's time had gardens at the back, and many at the sides also; and the space between the houses, combined with the unusual width of the streets, gave the town of Stratford an open, cheerful look, while the irregular line of gables and porches, of penthouse walls and garden palings, with patches of flowers and over-arching foliage between, still further varied the view. The house is plastered inside and out flush with the faces of the timbers. The measured drawings from which our reproductions are made were prepared by Messrs. Beazley and Burrows, architects, of 17, Victoria Street, S.W., for Sir William Ingram, Bart., who is the owner of the original drawings, and to whom we are indebted for the loan of them.

Professional Practice.

Belfast.—The new Mater Infirmorum Hospital, which was formally opened last week, has been erected from the designs (selected in competition) of Mr. William J. Fennell, M.R.I.A.I. The contractors were Messrs. Henry Laverty and Sons. The site has a frontage on the south of 230ft. to the Crumlin Road, and altogether contains an area of slightly more than one acre. It is composed of red boulder clay, with a gentle incline from north to south. The principal portions of the hospital may be said to consist of three distinct blocks facing the Crumlin Road, the centre one being the administrative building, flanked by a pavilion block on each side, that on the east being for males and the west one for females. These pavilions present their gable ends to the Crumlin Road, and extend backwards and parallel to the east and west boundaries about 146ft.; they are connected on the ground floor to the administration block by a wide corridor running east and west the entire length of the frontage, forming the main artery, so to speak, through the establishment. Each pavilion is three storeys in height, and contains two large wards on each floor, each of

these wards being provided with two sanitary chambers in towers, which branch off diagonally at the ends, and are separated by disconnecting corridors. The spaces formed outside the gable ends by the projections of these towers are utilised for verandahs for the use of convalescents. It might here be stated that the hospital is planned for 150 beds besides the cots for children, and that for each bed is allowed slightly more than 1,300 cubic feet of ward space, 9ft. of wall space, and 100 sq. ft. of floor space, some of the wards containing a little more. No provision is made for nurses' bedrooms near the wards. Once a nurse goes off duty she will proceed to the Home, where the nurses' beds and day rooms are, isolated from the scenes of hospital labours. The administration block contains on its ground floor the reception rooms, offices, and rooms of the resident medical officers. The first floor contains a number of rooms especially provided for patients who can afford to pay for special wards, and this has already been found to be a great boon, and is largely used. The top floor of this block is reserved for the use of the nuns who labour in the hospital. Behind the centre of the administration block, and separated from it by the main corridor, is the chapel for the use of the inmates and the patients. The chapel is flanked on each side by a corridor branching at right angles from the main corridor, off which are placed one-storey buildings containing the observation wards and "recovery" wards for patients' immediate use after operations. The east of these corridors also leads to the sacristy and the operating rooms, while the west one leads to the students' room and the lecture theatre and terminates in the disconnecting corridor between this portion and the kitchen range of buildings. This latter portion forms a complete range by itself, opening on the yard, and contains the usual kitchen appurtenances; off it are a number of stores filled with hospital necessities. It also contains dining rooms for the community and officials and members of the working staff. The buildings are of red brickwork with stone dressings, and will be heated by hot water and lighted by electricity; they have patent vulcanite flat roofing.

Birmingham.—Additions to St. Oswald's Church, Small Heath, consisting of west front, two adjoining bays, and south-east porch, have been made according to the designs of Mr. W. H. Bidlake, A.R.I.B.A., the sculptural work being executed by Mr. Martin, of Cheltenham. Mr. T. Rowbotham, of Small Heath, was the builder. It is now seven years since the eastern portion of the church, including the chancel and four bays of the nave and aisles, was erected on land given by Mr. C. Wriothesly. The new front contains a window of noble proportions and design, beneath which, on the inside, are five arched recesses. Two of these recesses are pierced by small lancet windows, and the centre one is filled with a memorial tablet in Connemara marble. The external doors are of massive oak, with wrought iron hinges of quaint design. The inner swing doors, the upper portions of which are glazed, are also of oak. The front is surmounted by a carved stone cross, beneath which, in a niche, is a life-size statue of the patron saint of the church—St. Oswald, Bishop of Worcester. When dedicating the additions, the Bishop of Coventry contrasted the beautiful with the simple in church architecture, and observed that it was at one time believed that the purest worship would be secured by the barest accessories, and we did ill if we spoke of those who so thought and planned as ignorant, or wanting in artistic feeling, or as men who grudged to give God their best. The spirit of Milton was quite as devout as the spirit of George Herbert, and Cowper was not less truly a worshipper of God than Keble. At the same time, it was equally unfair to speak of modern church restoration and adornment as a mere return to mediæval superstition. Beauty was not necessarily adverse to piety, nor was the love of it idolatry. Beauty was a reflection of the glory of God, and the beautiful could be, and ought to be, a help to devotion.

SHAKESPEARE'S HOUSE: PLAN OF SITE. FROM A MEASURED DRAWING BY BEAZLEY AND BURROWS, ARCHITECTS.

Dunston, Gateshead.—The Dunston Asylum is about to end its career, so far, at any rate, as its present purpose is concerned. In its place a new establishment has been erected at Middleton, between Darlington and Eaglescliff. Middleton Hall and the estate of 140 acres have been acquired, the Hall has been partly renewed, and extensive blocks of buildings have been erected on each side, all facing the south. The new institution has been designed by Mr. J. W. Dyson, of Newcastle, from whose plans was erected the new asylum of the Newcastle Corporation at Coxlodge, which is to be opened this month. A curious incident occurred during the reconstruction of the old Hall. While the roof was being removed the following sentence was found pencilled upon one of the timbers near the cornice: "John Lawson putt the cornish up, 24th July, 1815." That was just a month after the battle of Waterloo. The institution disposes of its own sewage.

Leeds.—The Freemasons of Leeds are about to provide themselves with a new hall, their old quarters at the back of the Town Hall having been sold. A limited company has undertaken the enterprise, and the estimated cost is about £6,000. The site selected is in Great George Street, opposite the new Pupil Teachers' College. There will be little distinctive in the architectural features. It will be a substantial building of three storeys in front and four at the rear, constructed of brick—brown glazed to the sills of the ground floor windows, red pressed to the first floor line, and buff pressed above—with red stone dressings. From a hipped roof, covered with green Westmorland slates, will rise an octagonal ventilating flèche or turret. The internal arrangement seems all that could reasonably be desired. The principal entrance in Great George Street will give access to an entrance hall, and this to two offices and a committee room, which, with the steward's room, will be situated in front. Behind will be a lodge room, 44ft. by 22ft. Such an institution would not be complete without dining accommodation, and of this there will be no lack. To that purpose the first floor will be devoted. Here will be situated a dining room 44ft. by 22ft., and another 61ft. by 30ft. with service room and lounge. On the second floor will be the principal lodge room, 61ft. by 30ft., and this, overlooking Great George Street, will have a circular ceiling with moulded ribs. Attached will be two committee rooms, an anteroom, and gentlemen's and ladies' cloakrooms. The kitchens will be located at the top of the house, and there also will be the caretaker's apartments. Lifts will likewise be provided. The accommodation, it is hoped, will meet the requirements of all the local lodges. Mr. J. Mitchell Bottomley, architect, of Leeds and Middlesbrough, has prepared the plans, and the principal contracts have been let as follows: Brick and stone work, Mr. J. T. Wright; joiners' work, Messrs. Craven and Umpleby; plumbing, Messrs. Braithwaite and Co.; plastering, Mr. J. Dobson; slating, Mr. James Season; and painting, Mr. A. Bateman. Twelve months will probably elapse ere the building is ready for occupation.

Mansfield.—The block of schools erected by the Mansfield School Board in Rosemary Lane, Mansfield, to meet the greatly increased demand for educational accommodation in the town, were formally opened on Wednesday last by Lord Belper. The land upon which the schools are erected was purchased from the Mansfield Grammar School Governors. In order to be thoroughly up-to-date, a sub-committee was appointed to visit the various modern schools in the neighbourhood, and after some consideration the Board, backed up by the sub-committee's report, decided to erect schools on the central hall plan to accommodate 800 children. The schools are arranged in two separate blocks, the larger (a two-storeyed building) finding room for 500 children (250 on each floor), and the smaller (a two-storeyed building) finding room for 500 infants; making the total accommodation 800, with an additional 120 in the

central halls of the boys' and girls' departments. The school is also provided with a small cookery department in the south-west corner, covered playgrounds, and garden. The various classrooms are arranged around the central hall, and in addition to the ordinary exits there are also provided doors for use in emergency. These open outwards and are fitted with patent panic locks. Special regard has, of course, been paid to the lighting and ventilation, the rooms being lofty and extensively windowed. The latest sanitary devices have been adopted; the rooms are floored with wood blocks having a foundation of concrete; and the classrooms in each block are separated from the central hall by movable glass partitions, which on special occasions may be thrown open. The architect is Mr. R. F. Vallance, F.R.I.B.A., of Messrs. Vallance and Westwick, and the contractors were Messrs. Gilbert and Gabbittas, of Nottingham, the amount of whose contract was £10,604.

Masters and Men.

The Carpenters and Joiners at Dudley have struck for an advance from 8d. to 8½d. per hour.

The Bolton Joiners have accepted a ½d. advance and abandoned the request for a reduction of hours.

The Tamworth Painters who recently struck for a ½d. advance have returned to work at the old rates pending the arbitrator's award.

A Joiners' Strike at Doncaster has occurred with the men employed by Messrs. W. S. Arnold and Son, contractors. The men number forty.

The Masons of Kilbirnie District have resumed work after being out on strike against a reduction of the rate of wages from 9d. to 8d. They have agreed to accept a reduction of ½d. till 1st July, when, if the Glasgow men are not then reduced, they revert to the old rate of 9d. an hour.

The Dunfermline Painters' Strike has been settled on the following terms: (1) That wages be raised from 8d. to 8½d. per hour. (2) That notice of any proposal to alter wages or rules should be given by December 31st. (3) That a conference be held on or before 1st February to consider the proposals made on December 31st. (4) That the settlement arrived at on February 1st come into force on April 1st.

Airdrie and Coatbridge Joiners' Strike.—At a meeting of the representatives of the masters and workmen held at Airdrie last week the following agreement was arrived at: That the men resume work at the old rate of 9d. per hour, that three months' notice be given on either side before 1st April for a conference, and that any rise or fall of wages then decided on should take effect on 1st June. A twelve months' agreement was signed to this effect, and work has been resumed.

Glasgow Masons' Wages.—A joint conference between the representatives from the Master Masons' Association of Glasgow and Neighbourhood and the United Operative Masons' Association of Scotland (Glasgow and Suburban Lodges) was held last week, when it was amicably agreed that the standard rate of wages for the ensuing year should remain the same as last year. The working agreement between both associations was also adjusted for another year, beginning on July 1st next.

Aberdeen Joiners' Strike.—At a conference between the masters and men last week it was agreed to refer the question of wages to arbitration, the point to be decided being whether there should be a reduction on the present standard rate of 8½d. The arbiters appointed were Mr. R. G. Wilson, architect, for the employers, and Treasurer Bisset for the men. At a previous conference it was proposed that wages should be reduced to 8½d. an hour. Pending the decision of the arbiters the men have resumed

work. Now the arbiters have failed to agree, Mr. Wilson being in favour of reducing the wages to 8d., and Treasurer Bisset in favour of 8½d. But ex-Lord Provost Mearns has been called in to decide between the two.

Joiners' Dispute in North-East Lancashire.—The six months' notice tendered by the joiners of Burnley, Nelson, Colne, Brierfield and Padiham for an advance of wages of from 8d. to 9d. per hour expired last Monday, and the men threatened to come out on strike yesterday, although the employers offered ½d. advance now and another ½d. in six months. The workmen demand a ½d. now, and offer to waive the other ½d. This the employers refuse, and also declined to submit the dispute to arbitration.

A General Joiners' Strike averted.—The dispute which has been proceeding in the building trade since November has been brought to an amicable conclusion. The branch of trade affected was the carpentry and joinery, and in November last the Amalgamated Society of Carpenters and Joiners notified to the Master Builders' Association that, at the expiration of six months, a general advance of 1d. per hour would be demanded, making the rate of payment 11d. per hour. The masters offered to meet the men half-way. This offer was eventually accepted. A conference was held between representatives of both sides, at which the offer was unanimously accepted on behalf of the men. At the same meeting a new conciliation clause was suggested.

Surveying and Sanitary Notes.

For Sewerage Works at Ruddington, the Basford Rural District Council desire to borrow £1,350.

Sanitary Institute Dinner.—Among the guests expected at the annual dinner of the Sanitary Institute to be held on May 11th; at which the Duke of Cambridge has consented to preside, are the Duke of Northumberland, the Bishop of London, Earl Egerton of Tatton, Earl Stamford, Lord Avebury, Mr. T. W. Russell, M.P., and the chairman of the London County Council.

Improvements at Rhyl.—A Local Government Board enquiry was held last week into an application of the Rhyl Urban District Council for sanction to borrow £37,000 for the purpose of establishing a complete installation of electric light for the promenade, streets, and private consumers, for erecting a refuse destructor, and for the further extension of the West Promenade.

Wood Paving for Edinburgh Streets.—The Streets and Buildings Committee of Edinburgh Town Council recommend that the following thoroughfares should be paved with wood:—The Pleasance in front of the Deaconess' Hospital (cost £477); Princes Street from Jenner's westwards to Castle Street, along the side north of the tramways, the beech blocks which have been in use for about ten or twelve years to be replaced with Australian hardwood on a prepared concrete bed (cost £4,800); Queen Street, east end, in front of the National Portrait Gallery, the south half with Australian wood and the north side with stone.

Destroying a Small-Pox Hospital.—All that remains of the small-pox hospital on the garrison site at Hull will shortly be reduced to ashes. This wooden and brick structure, which, in the recent outbreak at any rate, was an admitted centre for spreading the disease, has been already pulled down, and the materials are piled in stacks ready for the torch to be applied. Everything has been thoroughly sprinkled with bi-chloride of mercury, and more than twenty-five tons of coal have been requisitioned to assist the conflagration. The bricks, too, have been stacked in with the wood, so that they will be thoroughly calcined before removal.

Public Abattoirs for Yarmouth.—Last week a Local Government Board enquiry was held into the application of the Yarmouth Town Council for a loan of £9,000 for constructing public abattoirs and a stock market on Caister Road.

Problem of a Wheel Rolling upon a Road.—In the course of a lecture on "Road Locomotion" read before the Institution of Mechanical Engineers on Thursday last, Professor H. S. Hele-Shaw said that, when a wheel with a hard rim rolls upon a level hard surface, every point upon the wheel follows a curve as shown in (a) in the illustration given below, and since each point on the tyre comes

in succession perpendicularly upon the surface beneath, there is no appreciable resistance to the motion. When, however, the surface beneath is either soft (b), or irregular (c), the wheel no longer rolls in the same way, and the invaluable properties which it possesses are in a greater or less degree destroyed. Now it is difficult, from any data at present available, to separate the amount of resistance respectively due to each of the two foregoing causes. But in the accompanying table are set forth, from

Tramways
Asphalte
Tram Rails
Well laid Stone
Best Macadam
Paris Streets
Ordinary Macadam (a)
Ordinary Macadam (b)
Dry Meadow
Hard Dry Clay
Cobble Stones
Ordinary Road & Gravel
Ordinary Cobble Stones
Fresh Earth
Sand if dry & loose	

Telford and Babage's data, the resistances to traction on roads of various kinds, and here it would appear as if a soft road involved greater resistance than an irregular one, and was more to be considered.

Leeds Street Improvements.—The Improvements Committee of the Leeds City Council sat for more than three hours on Wednesday last considering various schemes for carrying out street improvements. For the purpose of widening Guildford Street, Meadow Road, East Street, and Jack Lane, it was arranged to purchase properties in these localities; and to make a continuation of Easy Road through to the East End Park. The estimated amount to be expended is about £25,000. It was also decided to form a new street commencing at New Briggate near Merriam Street, and passing into Brunswick Street, and thence into Camp Road. The street will be 42ft. wide. The City Council, at its next meeting, will be asked to sanction this scheme.

Sanitation of Hull.—At a recent meeting of the Water and Gas Committee of the Hull Corporation the report was presented by the engineer (Mr. Bancroft) with reference to the proposed substitution of water-closets throughout the city for the present system of dry earth closets. If the recommendations of the Sanitary Committee with respect to the substitution of water—for earth-closets—were adopted, he estimated the additional quantity of water required per day for flushing purposes at one million gallons at least, on the low basis of ten flushes per day for each closet. It would probably be half as much again, or double, due to waste and defective apparatus. The estimated cost of one million gallons of water per day in the city is £12 10s., this being equal to £4,562 10s. per annum. If this quantity of water were sold at 6d. per 1,000 gallons the receipts would amount to £9,125 per annum.

Builders' Notes.

Barnoldswick Building By-laws.—At the Skipton Petty Sessions recently Joseph Wild was summoned for encroaching 3in. beyond the building line with a window of some shop premises he was erecting. A fine of 1s. and costs was imposed.

Extraordinary Destruction of Chimney Pots.—At the Salford Hundred Quarter Sessions recently Walter Cooper, 43, builder, of Manchester, was charged with having done malicious damage at Chorlton-cum-Hardy to seven chimney pots, a number of roof and paving tiles, three coping tiles, and twelve panes of glass, to the amount of £35, the property of John William Wood.—The prosecutor is the owner of some houses at Chorlton-cum-Hardy. He engaged defendant to fix "Mansfield patent tops" to seven smoky chimneys over his houses on the basis of "no cure, no pay." The chimney tops were to be paid for at £3 each, £21 in all, but payment was not to be made until six months after the work had been done, in order that it might be ascertained whether the treatment had proved successful. Mr. Wood, however, paid £8 on account of October 18th, shortly after the chimney tops had been fixed. The treatment was unsuccessful and the tenants complained, and Mr. Wood made representations to the defendant, who tried to improve matters, but failed. Being again expostulated with and refused further payment, on February 28th the defendant went with an assistant to the houses and hammered down the chimney pots, threw the pieces into the street, and broke glass and paving stones. He shouted to Mr. Wood, who stood below, "You have the law, but I have my revenge."—Defendant said that he understood that during the six months covered by the contract he could put on or off what he liked on the chimney pots as long as he made good any damage which he did.—He was found not guilty and discharged.

New Patents.

These patents are open to opposition until June 4th.

1899. Syphon Flushing Tanks and Cisterns.—6,528. F. M. SIMS, F. T. HARROP, and J. H. HARROP; all of Manchester. This invention relates to an automatic intermittent syphon flushing cistern or tank which acts without valves and similar appliances. Scientifically, it is the adaptation of the principle of the hydrostatic balance to cause a certain measured partial vacuum to be formed inside a syphon system, by which the resistance of the confined air to the entry of liquid is readily overcome and the syphon started.

Cast Marble.—9,360. J. GERNAERT, Brussels. The object of this invention is the production of any shade of veined artificial marble by a regulated fusion of certain substances. For instance, the following mixture when kept in the furnace until complete fluidity of the sand will produce a green marble veined with green: Sand, 51 per cent.; opaline, 22 per cent.; carbonate of soda, 19 per cent.; lime, 2 per cent.; bichromate of potash, 6 per cent. A beautiful deep-brown veined marble may be obtained from the following mixture: Sand, 35 per cent.; carbonate of soda, 54 per cent.; lime, 6 per cent.; oxide of copper, 2 per cent.; iron filings, 3 per cent.

Folding Rules.—10,711. J. G. LILLEY and F. W. LILLEY; both of Margate. In connection with each joint of the rule there is a sliding bolt working in a dovetail groove; when this is pushed across the two parts the rule keeps rigid.

Wall Hangings.—11,279. L. PREAUBERT, Nantes, France. A backing of canvas is first covered with tinfoil, fixed on with cement. This surface is then given the colour of gold or silver by the aid of varnish. An imprint in

size, cement, or varnish is next made, and cut or shorn wool of the desired tint blown on. Large panels can be made in this way.

Removing Pitch from Paving Stones.—11,302. R. WHITFIELD, Old Trafford, Lancs. The paving stones are placed in or passed through a heated chamber, where the pitch melts off and is carried away by channels for future use. It is claimed that this method is quicker, more efficient, and less costly than the method of chipping or scraping the hardened pitch off the stones.

Street Gas Lamps.—11,431. G. LIVESSEY, London, S.E. The lantern is circular, and it has three supporting bars so arranged that the shadows of the two side bars cross the curb at an acute angle, while the side of the lamp next to the roadway presents a clear front.

1900.—Stopping Leaky Gas Joints.—1,996. S. R. DRESSER, Pennsylvania, U.S.A. To repair it, a sectional clamp ring is placed round the joint and its nuts screwed up. This ring has an annular recess to receive a packing ring.

Taps for Geysers and Water Heaters.—2,714. H. T. FENLON, London, E.C. The water-supply tap handle has a holed cross-piece with which the gas-tap handle engages when the two taps are turned off, and by this means it is not possible for the water tap to be completely closed till the gas is turned off.

The following specifications were published on Saturday last, and are open to opposition until June 11th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—5122. BOULT (*Fondu*), machines for moulding articles from molten glass. 6,983. BRIDGE, movable partitions for dividing schoolrooms, lecture halls and other buildings. 7,042. HAMILTON, machines for sawing cold metal and stone. 7,208. JONES, apparatus for use in making drawings from models or other lineal objects. 7,863. CAZIN, electric incandescent lamps and their manufacture. 7,992. KANE, public baths. 9,375. BREADNER, white-edged copings or slabs for railway platforms. 9,909. BOULT (*Molet*), apparatus for the production of acetylene gas. 10,412. MAY, mechanical purification of effluents of towns, factories, &c. 10,531. WISE (*Wood*), mortising machines. 10,559. HIPKINS, steelyard weighing machines. 10,618. WILLNER, treatment of wood for the purpose of hardening and rendering it fire- and water-proof. 10,640. BAILEY AND CALDWELL, hinged doors and shutters of the kind used in connection with ventilators. 10,786. SCHRÖDER, apparatus for use in the production of acetylene gas. 10,830. ROSS, syphons for flushing cisterns. 10,905. PERRET, adjustable support for the scaffolding or framing used in building concrete floors. 11,005. LEGGOTT, apparatus for regulating fanlights. 11,066. BOARDALL, weather bar for windows. 11,333. SIMPSON, treatment of wood with solutions for rendering it non-flammable. 11,418. POMEROY, electric arc lamps. 11,544. ELBEERS, process of manufacturing mineral wool, also called "slag wool" and "silicate cotton." 11,594. J. AND M. CRAIG, LTD., and HIGHT, after-service devices for flushing syphonic water-closets. 11,662. MILLS (*Pagnon*), bricks, tiles, &c. 11,697. GRACEY, operating portable hinged screens or partitions for dividing large rooms into smaller ones. 11,707. WOODWARD AND COLLIER, apparatus for conveying sanitary pipes and other similar articles from place to place. 11,722. SANER, bolt-fastening device. 11,805. ROUSE, manufacture of concrete and artificial stone for building and paving purposes. 11,840. TURNER, firegrates. 11,847. CARPENTER, stopper for wire ropes or cables. 12,053. THORN AND HODDLE, apparatus for generating and storing acetylene gas. 12,077. MACKEAN, method of marking incandescent mantles. 13,363. KLEIN, ventilation. 13,748. GLITSCH, burner for vapourised liquid fuel for incandescent lighting or heating purposes. 15,947. TAYLOR, window sashes and frames. 20,301. SANDS, shop-window fittings and show cases.

1900.—187. WILLIAMS, coping tile. 2,356. SIEMENS BROS. AND CO., LTD. (*Siemens and*

Halske Aktim Gesellschaft), apparatus for regulating the electric lights on theatre stages. 3,452, LAKE (*Ferris*), nut-locks. 3,488, HYDE and BETHUNE, eraser to use in connection with pens or pencils. 3,669, KRAUS, machines for cutting veneers and boards from thick planks, round wood, &c. 3,685, ENRIGHT, lifting slings. 4,058, JÖRGENSEN AND POULSEN, centrifugal apparatus for raising water. 4,084, CONNOR AND CONNOR, mitre planing machines. 4,178, DIETERLE, locks and latches. 4,182, PRAGER, apparatus for automatically igniting gas lamps. 3,365, SHOOLBRED, translucent reflectors for incandescent electric lamps.

Keystones.

An Exhibition of Sir William Richmond's Works is to be held in the New Gallery at the end of this year.

A Cottage Hospital at Colne has been opened. It is in the Tudor style, and has half-timbered work in the gables.

At the new Parochial Hall, Lurgan, a new organ has been erected by Mr. James J. Binnis, of Leeds.

St. Ninian's, Castle Street, Aberdeen, is to be purchased at a cost of about £4,000 for the purposes of the Aberdeen Dispensary and Maternity Hospital.

Glasgow Art Institute Secretaryship.—Mr. Percy H. Bate, curator of the Art Museum, Bath, has been appointed secretary of the Glasgow Royal Art Institute. The salary is £300. There were nearly 300 applicants.

R.I.B.A. Conversazione.—The Corporation of London have granted the use of the Library, Art Gallery and Council Chamber in the Guildhall to the Royal Institute of British Architects for the purpose of holding a conversazione in June.

St. Stephen's Church, Paddington, is to have several alterations made to it at a cost of £6,000. It is proposed to take down the west end of the chancel, and to build an apsidal end, to take out the present window, and form a chapel; also to provide a new communion table and a new oak reredos.

New London Market.—The foundation stone of the rebuilding of Portman Market, Church Street, Edgware Road, was laid on Friday by Sir William Pollitt. The new buildings will occupy an area of 43,426 ft. super., and ample accommodation will be provided for cold storage. The cost will be £33,000. Messrs. Gordon and Gunton are the architects.

Additions to the Law Courts.—Plans have been prepared and passed for four additional courts at the Royal Courts of Justice. They will be erected on the ground at the west end of the building, at present laid out as a garden, and will be separated from the main building by the existing footpath. The new building will be connected with the old one by means of a covered passage or gallery.

London (Royal Free Hospital) School of Medicine for Women.—The new buildings for this institution, of which the first wing was opened by the Princess of Wales in July, 1898, are approaching completion. The last, or Hunter Street block, will be ready for use next October. It will contain a very large common-room, refectory, library and museum, besides eight sets of residential chambers, in which seventeen students can live. The total cost of the new buildings will be about £30,000.

"Mural Painting in Relation to Architecture."—We very much regret that several printers' errors crept into the article on this subject which we published last week. In line 22 in the first column on page 206 "Antium" appears for "antique"; in line 63 in the second column of this page "computing" is printed instead of "completing"; a little lower down "observe" is used instead of "obscure"; in line 21 in the first column on page 207 "decoration painting" should be "decorative painting"; and in line 46 in the same column "Triforium—but" should read "Triforium-belt."

Registration of Architects.—A meeting in connection with this movement was held at Birmingham on Friday under the auspices of the Society of Architects. Mr. T. Walter L. Emden, J.P., L.C.C., presided, and a paper was read by Mr. Ellis Marsland.

At St. Neot Parish Church, Liskeard, a rood and parclose screen, choir stalls, and a lectern have been erected. The screen was designed by Mr. Fellows Prynn, president of the Architectural Association, and is in teak with figures in pear wood.

New Church Schools at Kidderminster have been built in Leswell Street at a cost of £2,000. Messrs. Meredith and Pritchard were the honorary architects, and Mr. Henry Smith was the contractor. Accommodation is provided for 250 infants.

A Washington Statue for Paris.—A statue of Washington, the gift of American women to the French people, is to be erected on the Place d'Jéna, at the angle of the Avenue d'Jéna and the Avenue du Trocadéro. It will be about 22ft. high. Mr. Daniel C. French and Mr. Edward Potter, both Americans, are the sculptors.

Office of Grand Superintendent of Works.—His Royal Highness the Prince of Wales, Grand Master of English Freemasons, has been pleased to appoint Mr. Henry L. Florence, of 3, Verulam Buildings, Gray's Inn, W.C., to the office of Grand Superintendent of Works for the ensuing year, being the third year in succession that this office has been conferred upon him.

Competition for new "Waterloo" Board School, Oldham.—In this competition there were thirty-five competitors, and Mr. A. N. Bromley, of Nottingham, was the assessor. The plans under Notts, "Wellington" (Mr. Richard Holt, architect and surveyor, of Liverpool and Southport), were placed first, and the Board adopted his award and appointed Mr. Holt as architect.

The Royal Academy.—In view of the opening of the exhibition at Burlington House on May 7th, it is worthy of note that the Foundling Hospital is the parent of the Academy. The chief artists of the day sent pictures from their own easels to decorate the Foundling, and this collection, becoming at once one of the sights of London and a handsome source of revenue to the Hospital, suggested an annual exhibition of similar works on a larger scale.

Aberdeen Architectural Sketching Club.—At a meeting of this club held last week (Mr. Levie presiding) Mr. Kelly's award in the recent competition was given. Two prizes were offered for the best designs for a small country villa costing £1,500. Mr. Kelly placed "Esmond" first, "The Major" second, and "Toujours Pret" third. The design "Esmond" is by Mr. George Forsyth; "The Major" is by Mr. Alex. Meldrum; and "Toujours Pret" is by Mr. Fenton Bisset.

London County Council Tramway Scheme Rejected.—The Light Railway Commissioners held an important enquiry last week. The London County Council sought powers to construct for electrical traction the following lines of tramways (1) a line from Clapham Common to Kingston; (2) a line from Deptford by Shooter's Hill to Woolwich; (3) a line from New Cross by Lewisham to Eltham; and (4) from Archway Tavern, Highgate, to the county boundary. This scheme was rejected, as the Commissioners considered it incomplete.

Architectural Photographs.—An exhibition of photographs (mainly architectural) is now open from ten to four at the rooms of the Royal Photographic Society, 66, Russell Square, W.C. They are the work of Mr. F. H. Evans, and include details of Ely, Wells, Bourges, Lincoln, St. David's and Canterbury cathedrals, Beverley Minster, Kelmscott Manor and Church, and the tithe barn at Great Cokkeswell. Mr. Evans has endeavoured to make his photographs as artistic and as true as possible, and with this object in view has not produced that unfortunate microscopic detail which characterises so large a proportion of architectural photographs. The exhibition is well worth a visit.

A New Baptist Chapel at Hornsey has been built at a cost of about £11,000 from designs by Mr. George Baines. It is situated at Ferme Park.

The Policeman Painter, E. T. Jones, of the Leeds City Council, sometimes called "the modern Constable," has had another picture accepted for the Academy this year.

Land Registry (New Buildings) Bill.—The object of this Bill is to raise £265,000 for the purpose of acquiring property and building a permanent office in Lincoln's Inn Fields.

A Statue of Professor Huxley, by Mr. Onslow Ford, R.A., was unveiled by the Prince of Wales in the Natural History Museum on Saturday. It is of white Carrara marble and is larger than life-size.

The Value of Land in Fleet Street.—A building site in Fleet Street, at the corner of Fetter Lane, was let on lease last week for a term of eighty years. The area of the land is 1,550 sq. ft. The rent realised was £930 a year, being at the rate of 12s. per sq. ft. per annum.

The Norfolk and Norwich Archaeological Society held its annual general meeting at Norwich on Wednesday last, General W. E. G. L. Bulwer, senior vice-president, occupying the chair. After business and luncheon had been disposed of, the members paid a series of visits to buildings in the neighbourhood.

Northern Architectural Association.—The annual report for the forty-first session of this association states that the present membership is 173 (members 54, associates 68, students 51), and that there is a balance in hand of £54 9s. Mr. William Glover, F.R.I.B.A., is the president, Mr. Frank Caws, F.R.I.B.A., the vice-president, and Mr. A. B. Plummer, F.R.I.B.A. (13, Grey Street, Newcastle-on-Tyne), the honorary secretary.

Leeds City Buildings Expenditure.—About £10,000 have been spent in Leeds during the past municipal year on the town hall, municipal buildings, judges' lodgings, and so forth, and a somewhat similar expenditure is contemplated during the ensuing twelve months. This amount includes quite a variety of necessary items, e.g., cost of lighting, wages of servants, cleaning, repairs, and other charges for maintenance.

"Architecture

. . . at the . . .

Royal Academy."

THE CRITICISMS WILL
BE ILLUSTRATED BY

Mr. C. E. MALLOWS.

New Companies.

Gloucester Joinery Company, Limited.

This company was registered on April 14th with a capital of £2,000 in £1 shares to carry on the business of woodworkers, joiners, furniture manufacturers, &c.

The Fennia Timber Company, Limited.

This company has been registered in Scotland with a capital of £25,000 in £10 shares to carry on in Great Britain and Ireland and in Finland and Russia the business of saw-millers and timber merchants. Registered office: Marine Parade, Dundee.

Marl Park Land Company, Limited.

This company was registered on April 24th with a capital of £20,000 in £10 shares to acquire certain land at Llanrhos, Carnarvon, and to carry on the business of land owners, builders, &c. The first directors (to number not less than three nor more than seven) are Mrs. A. Ayling, O. S. Pilkington and R. Conway. Registered office: Llewellyn Chambers, Llandudno.

Oscillating Frame Cowl Company, Ltd.

This company was registered on April 18th with a capital of £1,500 in £1 shares to acquire certain patents from W. B. Ramsey, C. Davies and A. Lee, and to manufacture and deal in cowls, chimney pots, fire grates, ventilators, tools, machinery, &c. The first directors (to number not less than five nor more than nine) are to be appointed by the subscribers.

Engineering Notes.

The Lighting of Perth.—The Perth Commissioners propose to spend £50,000 in connection with the gas works, and £50,000 for the installation of the electric light.

Widening of Stockbridge Bridge.—The Streets and Buildings Committee of the Edinburgh Town Council have approved of a modified plan for the widening of the bridge over the Water of Leith at Stockbridge. The first proposal showed a width of 61ft. from parapet to parapet, and the modified plan 55½ft.

County Bridges and Electric Mains.—On Thursday last Mr. Ritchie received a deputation from the County Councils Association asking that County Councils should be protected from being responsible for damage to electric mains through necessary widening and repairs of bridges. Mr. Ritchie said that whilst not unfriendly to their principle, he thought any new legislation on the subject should not be retrospective.

Electricity on the Underground.—It is expected that the Board of Trade will shortly sanction the running upon the Metropolitan District Railway, between Earl's Court and High Street, Kensington, of a train propelled by electricity. The current employed is a continuous one, with a potential of 500 volts, and is made by Belliss-Siemens' generators in a temporary power-house at Warwick Road Junction. It is intended, however, to erect a generating station at Chelsea Creek, and Parliament will be asked to give the necessary powers.

New Water Filters for Troon.—The Burgh Commissioners have decided to accept the tender of Mr. James Osborne, Ayr, amounting to £2,310, for two additional filters at the waterworks, and of the Glenfield Kennedy Company, Kilmarnock, amounting to £83, for sluice valves, &c. The work has already been begun, and it is expected to be completed within the next three or four months. The present filterage capacity is 311,040 gallons per twenty-four hours, and when the increased accommodation is provided it will be 622,080 gallons.

Liverpool Engineering Society.—During the quarter of a century this society has been in existence it has proved a most useful institution to those associated with the various branches of engineering in Liverpool. During

the twenty-sixth session, just closed, no fewer than 119 members, associates and students have been elected, making the total on the roll 509. Both the city engineer (Mr. J. A. Brodie) and the city electrical engineer (Mr. A. Bromley Holmes) interest themselves in the society, the latter having occupied the position of president during the past session, in which office his immediate predecessor was Mr. J. A. Brodie.

New London Railway.—The inter-communication of the metropolis will be considerably improved on the completion of the Whitechapel and Bow Railway, a line which will form a junction between the Metropolitan District Railway's terminus at Whitechapel and the London, Tilbury and Southend line at Bromley. Instead of running into Fenchurch Street, almost the whole traffic of the latter line will be diverted to Whitechapel, where it will be in touch with the underground railways. The line passes under the Mile End Road and Bow Road from Whitechapel, and thence to Bromley. Stations are to be erected at Stepney Green, Burdett Road, and Wellington Road. Up to the present over half-a-mile of tunnelling has been completed.

Holloway Bros.	5,430	498	465	6,400
Tompsett and Co.,	—	—	—	—
Farnham*	5,345	470	450	6,265
Hutchinson	5,310	495	456	6,261

*Amended tender accepted, £6,358 ss. sd.
LIMPSPFIELD.—For infants' home at Limpfield, for the Church Missionary Society. Mr. John Norton, architect. Quantities by Mr. S. J. Thacker:—
Alfred Bush ... £6,288
Thos. Boyce ... £6,081
Perry and Co. ... 6,141
Lawrance and Sons* ... 5,985
*Accepted.

LLANDONNA (Wales).—For the construction of sea-wall, flood gates, &c., Wern, Red Wharf Bay. Mr. Joseph Owen, architect, Menai Bridge:—
J. K. Baker ... £2,375 15 0
John Griffith ... 2,500 0 0
Jones Bros. ... 1,469 0 0
Parry, Menia ... £1,457 0 0
*Accepted.

MELINCRYTHAN, NEATH.—For the erection of school buildings at Melincrythan, for the Neath School Board. Mr. J. Cook Rees, architect, Neath.
Evan Thomas ... £26,700 0
Lloyd Bros., Swan-sea ... £26,700 0
Seven Sisters ... 27,588 0
John Davies, Port Talbot ... 6,662 0
Thomas Watkins & Co., Swansea ... 7,107 0
H. Billings, Swansea ... 6,900 0
W. Francis, Bridge-end ... 6,900 0
J. Marles and Son, Swansea ... 6,887 0
Walters and Johns, Morriston ... 6,848 0
Barry Dock ... 5,566 10
*Accepted.

MENAI BRIDGE (N. Wales).—For the erection of schools and residences, Llan-yddall, Anglesey. Mr. Joseph Owen, architect, Menai Bridge:—
John Griffith ... £2,004 0
J. and R. Evans ... 1,575 0
Wm. Pritchard ... 1,398 15
Hugh Williams, Llan-yddall* ... £1,390 0
*Accepted.

MIDDLESBROUGH.—For the erection of a large block of business premises, South Bank, for the Middlesbrough Co-operative Society. Mr. W. G. Roberts, architect, 61, Albert-road, Middlesbrough. Quantities by Mr. Fred Cartwright, Foster's Buildings, 22, High-street, Sheffield:—
Murgatroyd and Sons ... £1,950 0 0
Alison Bros. ... 10,500 0 0
Wm. Thompson ... 9,776 11 8
J. T. Bulmer ... 9,750 0 0
G. Rodge ... 9,685 19 6
W. A. King ... 9,553 17 0
S. Coates ... 9,374 17 0
Perks and Son ... £9,346 9 9
Executors of the late J. Johnson, Middlesbrough* ... 9,264 0 0
Hudson Bros. (withdrawn) ... £9,258 0 0
*Accepted.

MIDDLESBROUGH.—For the erection of Ayresome Schools, accommodation 1,270 children, with caretaker's house, for the School Board. Mr. J. Mitchell Bottomley, architect, 28, Albert-road, Middlesbrough:—
Leeder and Son £15,253 1 1
S. Coates ... 16,918 8 1
Executors of J. Johnson ... 16,264 0 0
W. A. King ... 15,993 3 7
W. Pounder ... £15,721 15 4
G. Scales ... 15,994 0 0
Alison Bros., Middlesbrough* ... 14,724 0 0
*Accepted.

NORTHAMPTON.—For the erection of new box factory, St. James' End, for Messrs. Scott and Co. Messrs. Mosley and Scrivener, architects, Fish-street, Northampton:—
J. M. Panting ... £1,215 0
Wingrove & Stanley ... 1,198 10
E. Archer ... 1,195 0
Sharnham and Son ... 1,190 0
J. Garrett ... 1,156 0
G. J. Fisher ... £1,138 0
A. J. Chown ... 1,125 0
W. Beardsmore ... 1,108 0
A. P. Hawtin* ... 1,094 0
*Accepted.

OGBOURNE (near Marlborough).—For alterations and additions to bakery, for Mr. T. Dixon. Messrs. Ainsworth and Harwood, architects, Swindon:—
Parker ... £865
Liddington* ... £245
*Accepted.

PAIGNTON.—For the erection of stabling, coach-houses, &c., at "Stearfield," for Mr. Washington M. G. Singer. Messrs. Bridgman and Bridgman, A.R.I.B.A., M.S.A., of Torquay and Paignton, architects. Quantities by Mr. Vincent Catermole Brown, Paignton, Devon:—

	Time.
H. Drew (Paignton)	£4,270 10 months
R. Yeo (Torquay)	4,250 6 "
R. Yeo (Torquay)	3,997 9 "
Geo. Webber (Paignton)	4,000 6 "
Dart and Pollard (Paignton)*	4,000 3 "
Dart and Pollard (Paignton)	3,875 6 "
W. A. Goss (Torquay)	3,999 9 "
J. C. & W. Watson (Torquay)	3,880 7 "
S. Blatchford (Torquay)	3,700 7 "

*Accepted.
ROYDON.—For detached residence, to be erected for Mr. F. Bull, at Roydon, Essex. Mr. F. Child, surveyor 65 and 66, Chancery-lane, W.C.:—

	Extra for hollow walls.
Fred. Britton	£1,800 0 0 245 0 0
Wells and Sons	1,092 0 0 83 0 0
Elms and Co.	1,050 0 0 141 0 0
Glasscock and Son	1,008 0 0 not given
F. Hitch	949 0 0 119 10 0

SWINDON.—For the erection of a Primitive Methodist Church at Rodbourne-road, Even Swindon. Messrs. William Drew, M.S.A., and Sons, architects, Swindon:—
A. J. Colbourne £1,319 17 4
Tydemans Bros. ... £1,160 0 0
C. Wilkins ... 1,249 5 0
R. J. Leighfield* ... 1,151 0 0
J. Williams ... 1,217 0 0
*Accepted.

SWINDON.—Accepted for forming roads, laying in drains, &c., on the Even Swindon Estate, for Mr. James Morrison, J.P. Messrs. William Drew, M.S.A., and Sons, surveyors, Swindon:—
J. Williams, Swindon ... £1,655

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

The Pendulum of Art Criticism.

It is interesting to watch the growth and decay of one school of art criticism after another. For a long time John Ruskin held the field, but there are signs of a revulsion against some of the principles most closely associated with his name. It is true that this latter-day tendency is most noticeable among the painters, for of all the arts, painting, from the versatility and variance of its motives and aspects, has been least amenable to the doctrines of Mr. Ruskin; and for many years Mr. Walter Armstrong, and, in a less direct manner, the late Mr. R. A. M. Stevenson with other art critics, have taken a standpoint diagonally opposed to that of "Modern Painters." It is, however, of architecture we have here to speak: the subject to which Mr. Ruskin first applied his poetic instincts, and upon which his influence will be, assuredly, most lastingly felt. This may be said advisedly, for it must seem a logical conclusion from any comparison of his writings with the peculiar qualities of architecture as differing from the kindred fine arts. It is often and rightly observed (indeed, the saying has become a truism with us) that architecture deals in abstractions; that it is a presentative art, as distinct from representative; and when we recognise how the real value of Mr. Ruskin's work lies in its abstract teaching, in the spirit of its philosophy, and by no means in its concrete examples and specific figures and illustrations, we have good reason for believing (even did we not know it by a hundred subtle and convincing intuitions and manifestations) that the present revulsion of critical feeling in certain quarters will not readily spread to include architecture. If anything is to be regretted of the noble books that have come from Mr. Ruskin's pen on the subject of architecture, it is a too frequent divergence from his purely abstract lessons; and the pages wherein these lapses occur will always be of least value for us. We may well conceive this if we compare his works with those of a contemporary writer with whom he had much in common—Thomas Carlyle. Even in the essays written in criticism of the politics of his day, Carlyle contrives to keep clear of specific recommendation, of direct advice or practical suggestion: and it is his strength. Mr. Ruskin, on the other hand, is ready to enlarge upon the technical utility of the nail in the same page upon which he has invoked the Divinity. Too often, also, he runs his philosophy to ground. In his "Poetry in Architecture," for an example,

there is a fine passage on the woodland cottage, emphasizing the reliance of the beauty of a cottage upon its coincident fitness with country, the scene, and the locality of the site. From these he advances that whenever the pitch of the roof agrees with the angle of the surrounding tree clumps, this unison of effect is expressed; and advises this should be considered in the designing of the cottage. Lastly, he gives a diagram, showing, by letters A, B, and C, how this angle may be obtained from the line of the tree-tops, and plotted to fit with the dimensions of the intended roof. The chapter is a retrogression from the sublime to the ridiculous. Like Samuel Johnson, Mr. Ruskin had a butt end to his pistol, and he

fairly be considered detractors from the inherent value of Mr. Ruskin's writings on the subject of architecture, should, however, rather add to, than detract from, the appreciation of his books; because, though they impinge upon, yet they do not form part of his central lesson. For this reason, and for the reason of the purely *presentative* nature of his subject above referred to, the changing fashion of criticism in the kindred fine arts will not readily be applied to architecture. Indeed, it may also be said that the case of the architect is reversed with the painter; and that the latter finds the technical and specific phase of Mr. Ruskin of greater value and interest for him than the rhetorical and philosophic.

B. C.

CHATEAU DE BLOIS. DRAWN BY C. E. MALLOWS.

was all too ready to avail him of this great power of derision of his; not as Carlyle would affect it, but in just such specific terms, as we have shown, he will make application of his theories, and by one phrase banish the conviction his earnestness and persuasion have established in the mind of his reader. To term St. Stephen's "a foolscap in freestone"; to say vermiculated rusties are like "worm-castings" by way of condemnation of them; to revile the west window of Winchester Cathedral because, as a climax, it has "two pleasing interstices in the shape of carving knives"; and such other conceits, must always detract from the dignity of his personality and purpose. To recognise these characteristics, which may

An Old Coaching Town. OUTSIDE the range of Gothic, ecclesiastical, and domestic work, relics of a long by-gone habit of thought and phase of manners, few experiences are more charming than the happening upon one or other of those old coaching townlets which arose from their previously humble status of country villages at the period when the coaching era set in. Cathedral cities, and ancient towns which owed their rise to the fact of the neighbourhood of abbeys and priories, have an interest apart from the conduct of life as we know it, but the old "thoroughfare" towns and villages that depended upon the road-travel of from two hundred to some sixty years ago are not too

far removed from our own time for their buildings to have a keen interest for the student of domestic architecture.

It is the especial charm of these places that, since railways came and left the roads deserted, they have remained unaltered, save in the fact that their streets are now silent, instead of informed with the noise and circumstance of travel. Such a place is Bawtry, in Yorkshire. Coaching days made it a busy townlet on the great road from London to the North, and brought coaches, post-chaises, and lumbering road-wagons to jostle in Bawtry's now empty street, a street whose width is a revelation of the space once considered necessary and now altogether superfluous; just as the long pillared range of stable-yards beyond the old coach archway of the "Crown" has now become.

Bawtry to-day is a great emptiness. Four square red-brick houses of a certain modishness, being indeed built on the model of the town house, look across the void roadway, with a kind of patronising air, upon the peaked, timbered, or lath-and-plaster gabled cottages that border the opposite side of the street. Much older they are, those old cottages, and more akin to the country. They were built long centuries before the coaching age came, bringing a greater prosperity and consequent expansion to Bawtry, and for a time they were quite put out of countenance by the new-fangled brick houses, with their classic porticoes and brass knockers and impudent red faces. But a period of eighty or ninety years, at the most, saw the beginning and the end of this expansion, and the fashionable air of those houses has altered to an aspect of old-world dignity. Both the gabled cottages and these Georgian houses would feel greatly degraded if confronted with examples of the way in which the small country builder runs up his tasteless structures nowadays, but happily Bawtry has nothing of this type to show, and the white stuccoed elevation of the "Crown" alone hints at a later phase in building taste, typifying the dawn of the nineteenth century and the course of taste in its earlier years. This white-painted frontage marks the close of Bawtry's busy days. Soon afterwards the place ceased to lived a pulsing everyday life of business and activity, and began to merely exist. There are shops here—old bow-windowed, many-paned shops—which have long seen their best days go by. They came into existence under the influence of the beatific Law of Demand and Supply, when all the inns were full of travellers who wanted the thousand and one necessities of civilisation. They did a brave trade in those times, and continued it until the railway snuffed it out in 1842. Since then no one has come to buy, and their stock must contain many curiosities. Probably the stationer has still some of that goffered and perfumed pink notepaper on which the young ladies of sensibility wrote their love-letters in the long ago, together with a goodly supply of the wafers with which they were sealed; and, doubtless, those who seek could find flint and steel and tinder-boxes elsewhere. Bawtry, in fine, is a monument to the Has Been.

C. G. H.

On Reflection.

Chimney Pots. HAS it ever struck the reader what an ugly array the chimney pots of our cities make as they stand outlined against the sky? Probably it has, if the reader happens to have the slightest interest in or care for the architectural merits of the houses around him; but there are numbers of builders and so-called architects who seem to think that because the chimney is high up, and its use is to carry away smoke, there is little need to trouble about whether it harmonises with the building it serves or not. And no doubt this is why the chimney pots are massed in their present order, or rather disorder. They may be long and tapering, wide and short, square or round—no matter what their form, they are generally so arranged that they look as unsightly as possible. There is no good reason for doing this, though the cause is not far to seek. Draught is responsible for all the evils. Everything makes towards the production of good updraught, and the prevention of bad downdraught, and rightly so. But this is no reason why great lanky zinc pots, with bends and twirls, surmounted by cones in all positions, hoods and vanes, need be placed in such amazing numbers over the roofs. In London this is perhaps seen most markedly. Take a walk around some of the west-central squares, for instance, or along some suburban streets, and you will see that the lavish and awkward way in which these zinc chimney pots are disposed is positively disgraceful, spoiling all the sky lines. Builders and architects might very well devote a little more attention to this matter.

For Preserving the Old.

It sometimes happens that a deed or a work that eventually has a most important and extensive bearing is done or begun in an unostentatious manner, and the public whom it particularly concerns, being attracted by greater or more showy matters, are not aware of its existence till it reaches its zenith, when they look back at its humble, though admirable, progress, and wonder how it is they have been so ignorant. Or sometimes they see the result of its work, admire it, yet are perfectly unaware or unsuspecting of the power behind. An example of this is given in the case of many old castles and abbeys that are now made tourist spots. Buildings of this kind, and, in fact, all ancient remains, have, however, received considerably more care and attention in Ireland than in England, for while a vote of something under £100 is all that the latter country devotes for the preservation of the pre-historic monuments in charge of the State, thousands of pounds are at the disposal of the Irish Commissioners of Public Works for the maintenance of disused churches and abbeys, about £50,000 being provided by the Irish Church Disestablishment Act. The sphere of the Commissioners' work was, moreover, extended in 1892 by the passing of an Act which brought "any structure, erection, or monument of historic or architectural interest" into the fold. Taking advantage of these powers, the Irish Office of Works (with which the late Sir Thomas N. Deane is inseparably connected) has done good service, and has intervened to save many precious fragments which would otherwise have fallen into ruin. But the English Office of Works has quite a different story to tell, though it is to be hoped that things will shortly be much improved. A Bill dealing with this matter, which was introduced by Lord Balcarras, has passed the House of Commons, and will shortly be brought by Lord Avebury (formerly Sir John Lubbock) before the House of Lords,

who, it is hoped, will not stand in the way of its being put on the Statute Book. This Bill is of great interest, and its main aim is to bring the English Board of Works up to the Irish standard. It extends the Irish Act of 1892 to Great Britain and will enable such a building as Tintern Abbey to be placed (the owner's consent being given) under State control, and there could then be no talk of wealthy Americans carting off the grand old ruin stone by stone and re-erecting it on Yankee soil. In addition, it will place county councils in England and Scotland in the same position as that now occupied by the London County Council as the result of the power it obtained some little time ago for preserving historic structures or places in the metropolis. But there is still another item, that of empowering the Commissioners of Works and county councils to receive voluntary contributions towards the cost of maintaining or preserving any monument, and it is only necessary to remember how most valuable additions to open spaces in London have been made in this way to appreciate the value of the provision. In fund-raising for this purpose the Natural Trust for Preserving Places of Interest and Beauty has long been busy, and the Bill provides for co-operation between this little-known-of Trust and county councils. From the foregoing statements it will be seen that every lover of archaeological, architectural or historic remains will be in hearty accord with the spirit of the Bill and be a warm wisher for its sanction by the House of Lords.

The Vatican. As buildings used by large communities must necessarily conform with the requirements of an age of improvements, it is not surprising that even such a conservative institution as the Vatican cannot escape the general progressive reforms that have made such changes all around us. Some time ago it was stated that an American had offered to bear the expense of having St. Paul's Cathedral wired for the electric light, then a London morning newspaper said that this was not so, a statement which a leading electrical journal promptly denied. So far as we know, the work is still in hand; but the Vatican has undergone much greater changes. First of all, the Pope had steam heaters installed in his apartments; then those mystery-haunted passages, the Catacombs, were made brilliant from end to end with electricity; then the Apostolic Palace was similarly treated; and now a dispute is in progress as to whether the candles in the apse behind the high altar shall be replaced by glow lamps. Of these candles there are about 20,000, which burn from nine in the morning till five at night, being supported by about 1,000 candelabra (two of which hold 800 candles each) hung from the roof. The substitution of the electric light in this part of the great Italian cathedral would not, we think, be a wise reform, however much trouble of lighting it might save, for there is something in the twinkling of the candle flame which has no counterpart in the never-changing electric light, a something whose absence detracts considerably from the total effect. The idea of switching on the lights to an altar is as repugnant to one's sense of fitness as would be the suggestion to take away the present benches in Westminster Abbey and replace them with tip-up chairs covered with blue velvet. The "advanced" party ought always to be on the look-out that its latest reforms do not do violence to the sentiment of sanctity, which, in the minds of many, attaches to the traditional accompaniments of public worship, and it is to be hoped that electric lamps will not take the place as altar illuminants of their more troublesome, but certainly more beautiful, predecessors.

ARCHITECTURE AT THE ROYAL ACADEMY.

FIRST NOTICE.

THE architectural room at the Royal Academy retains much of its usual character and aim. Year after year we find complaints made as to the constitution of this exhibition and the laws which seem to govern it, and suggestions are thrown out as to its improvement, but it still goes on much as usual, and presumably it always will.

One has to take into account, when judging it, that it seems to make no pretence to be a collection representing the highest and the best that architects of the present day are capable of producing; but rather a collection of those things which a kind or unkind fate has permitted or forced them to produce or to perpetrate. And the difference is vast.

The Academy, no doubt, is the best judge of its own affairs, but all the same we cannot help wishing that it would devote itself a little more to fostering high ideals and magnificent impossibilities, and that architects might find here a chance of exhibiting, and a certainty of a sympathetic appreciation, of the best they are capable of imagining or creating, quite regardless of the fact that such schemes may never be executed. There is too much in this yearly exhibition of work which may be of importance from a commercial or a social point of view, but which, from the artistic point of view, is of little worth.

Of practical every-day productions which satisfy practical every-day needs, practical every-day people are possibly the best judges and the warmest admirers, and artists will always find outside these walls adequate, and more than adequate, encouragement for this class of work; but of the purely artistic work that a man might be capable of producing, if he had the chance, of the aspirations and ideas that sweeten the drudgery of every-day life, and keep alive the lamp of art, and which sometimes take form in those visions which too rarely haunt the soul—of these artists should be the better judge. Where, if not here, can such things be appreciated? and to whom would an artist wish to appeal for sympathy and support if not to his brother artists? and what better work can an Academy perform than to cherish this spirit of art and feed the sacred flame? What one does feel is that here, if anywhere, designs should be accepted purely on their merits as art, and

without any reference to the importance of the building, or the position of its producer. The interest which an academy of arts takes in a building should be an artistic interest, and that alone; but the contrary is so notoriously the case that it is well understood that an ideal design has a much better chance of acceptance if it has a misleading title, which

gives the impression that it has been, or is to be, executed. This is not as it should be.

If we come to think of it, we naturally should suppose that the work which an academy would be expected to encourage would, in the nature of things, be academic, in the real meaning of the word, if there is any meaning in a name. The work it exhibits should be true in principle, should carry on the best and the highest traditions of art, and should show a knowledge of all those things which are capable of being taught, and which are the outcome of experience. By making its selection on some such lines it would help to raise and maintain a high standard, and so would do a real service to architecture.

It may possibly be the fact that it is convenient and useful to architects to hold an annual exhibition of those things which they have actually carried out during the past year or so with no reference to their value as works of art. Such exhibition may be of great interest to themselves and their clients, and even, to some extent, to their brother architects, but it is of little interest to other artists, and still less service to art, and the last place in which one should expect to find it would be an academy of arts. But here it is, and we must take it as we find it.

On entering the room we find right in front of us a design by Mr. J. Belcher, for the Eastern Telegraph Co., which, to some extent, illustrates our remarks, for we think that no one would hesitate to say that the importance of the building commercially, and the position of its designer, outweighs its merits as a work of art. Neither can it in any sense of the word be called academic, though this, in the present state of public feeling, would not be looked upon as a reproach. What strikes one most forcibly is that the designer has made up his mind to treat the Renaissance style in a novel manner, and has gone out of his way—and out of the way of the best art—to do it. The Renaissance—and, for the matter of that, any style—is a complete language, which has been

evolved, like any other language, to enable mankind to express its ideas and feelings. It has, therefore, its mutually agreed upon laws of grammar, of structure and composition. Every feature has its appropriate place, in which it is generally recognised as meaning certain things, and it is so understood by the student of that particular language. By means of this generally accepted language artists have been able to express themselves freely, without the necessity of inventing new words and a new language for every poem which they wished to write. Had this been necessary no poems would ever have been written, and if they had been no one would have understood them. This is rather our position on looking at this design; we do not understand it, we cannot make out what it is the artist wishes to say, or realise what it is he feels. It may be our own fault, but, at the same time, a really great work of art makes something of its meaning clear even to the meanest intelligence, while this fairly baffles us. The artist seems to be using a particular variant, or dialect, of a bygone language, which, as far as we know, has been invented by himself; and his principal energy seems to have been spent in so doing. This, to anyone not thoroughly conversant with his dialect, is confusing. The mind has already become accustomed to, and is, generally speaking, more or less acquainted with the general structure of this particular language, and has got used to seeing certain features which perform certain functions, and which, in certain positions, mean certain things; as a column, or a corbel, or the antefix on a pediment; or, again, the relative value and distinctive character of a main cornice, and an attic or basement cornice. The difference of character in every feature is easily appreciated, its appropriateness recognised, and what the artist is trying to do is fairly understood; but, when one sees a building into which all these features have been introduced, in what seems a haphazard fashion, without any apparent reason, and often in a way that destroys their original meaning, one gets lost and puzzled, and the design does not appeal.

Take, as an example of this, the treatment of the first-floor and other windows, which have slight pilasters, or strips, running up each side and terminating in brackets, which carry a cornice over the window openings. This cornice returns round the projection of the brackets, and runs along the wall, over the window, for about a quarter of the width of the window, where it returns on itself against the wall, leaving a gap of about half the width over the centre of the window, where there is nothing in the nature of a hood mould. We must confess we entirely fail to see why this has been done. We understand the meaning of a Renaissance cornice, or a Gothic hood mould, over an opening, where it serves its practical purpose of protecting the opening from the weather, and of throwing off the water; and we can appreciate its æsthetic value in softening the otherwise violent contrast between the plain wall and the void, and its use in helping to give the opening any proportion or relative value that may be desired, or in obtaining a line of a desired weight at this particular spot; but the treatment we find here we do not understand, and it seems to us to be wrong in principle. If a window, or a door, needs any protection from the weather, it needs it most of all in the centre. If these windows needed any protection, why was the cornice not run through? And if they need none, why is it there at all? There are other features in this building to which objection might legitimately be taken, did space permit.

We do not wish to be misunderstood. We do not for a moment maintain that the artist must be bound down by arbitrary rules, or that he may not express himself as freely as he pleases. It is open to anyone to improve on the proportions of a classic column. But, if he finds the Renaissance too limited a language for free expression, why does he adopt it at all? If no known language is free enough, why does he not create one?

WOODTHORPE HALL.

But if he does deliberately adopt this or any other settled and recognised language we think he is bound to respect its general spirit and style. To do otherwise, and to use it as far as convenient, or as far as his knowledge may take him, and then, when some modern idea or requirement has to be expressed, or when knowledge of the language fails, to distort the construction of a sentence, or to pervert some word from its original meaning, or invent a new one, is to produce the dog-Latin with which we are occasionally amused by Mr. Punch, but which, if taken seriously, would cause every artist to deplore the mutilation of an old and perfect language in which some of the most beautiful ideas of humanity have found expression.

It may be that an artist who is struggling after a new and more free expression is bound to lose purity of style. But where such an attempt is genuine and sincere we generally find that every feature introduced has been suggested by necessity, and does, at any rate, attempt to perform and express its function, whatever it may lack in harmony or distinction of style.

SOME OLD DERBYSHIRE HOUSES.

By JAMES R. WIGFULL.

THE country surrounding Cartledge Hall, near Sheffield, has been described as a bleak and desolate moorland. It is hilly, but the land is, with the exception of the wooded portions, entirely under cultivation, and within a radius of a mile and a quarter are nine or ten examples of old domestic work. These show traces of the great variety of styles which are included in the term English Renaissance. Possibly these buildings are not so ornate as some to be found in other parts of the country, but they possess an interest to us as architects in that they show the honest use of local material and a restraint and avoidance of fussiness in detail and design; their builders worked in the traditional style of their forefathers, into which they gradually introduced some traces of that new manner of building which, coming from abroad, was eventually to supersede our national style.

It is interesting and instructive to take the buildings of a particular district and note the manner in which the various features of the new style made their appearance; usually the doors and chimneys betray the first traces. Early evidence is also found in the gate-posts and mantels, if by good fortune these remain. For a long time the windows in this neighbourhood retained their plain chamfered mullions, slightly recessed from the wall face, after the rest of the work had become quite Renaissance in detail; but eventually these gave place to

plain square mullions. While these changes in detail were taking place, there was another, and very important one, gradually making itself felt—this was the accentuation of the horizontal lines of the buildings. This emphasis of the horizontal lines is, as you are aware, one of the distinguishing marks of the Renaissance style, and its gradual introduction into the simple domestic work of the seventeenth century, while at the same time the gables were as gradually eliminated, make the buildings of this period of exceptional interest for the purposes of study.

I have selected the buildings of the district lying between Totley and Unstone for the purpose of the present paper. Not only are the buildings of this district of exceptional interest to us as students of architecture, but their former owners played an important part in the history of their day; especially was this the case during the time of the Civil War. This, however, is scarcely within the scope of our present subject, although it cannot be ignored entirely in any description of the buildings. Before considering these in detail, it may perhaps be advisable to direct attention to certain points common to all, or nearly all, of them.

The plans show buildings narrow in width with projecting wings. This system was no doubt due in a great measure to the materials used in roofing; the use of stone slabs, or grey slates as they are known locally, is universal. The valleys formed by the intersection of roofs are worked in the same material; lead for this purpose is quite unknown; some few instances occur where it is used for gutters behind parapet walls, but its absence generally is noticeable. I have referred to the windows having either plain chamfered or square mullions. So far as I am aware, there is only one example in the district chosen where a moulded mullion is to be found. This is at Horsleygate, where an ovolo mould replaces the chamfer. The chimneys, too, express the local type admirably. They are always placed centrally over the ridge, and frequently form the crowning feature of the gables. Two varieties are to be found, one, where on a square base one or more square shafts are set diagonally, the junction between the base and shafts being formed by plain chamfers the shafts having moulded caps crowned by a blocking course. The other type, and, perhaps, the more common one, consists of a plain square stack, usually with a chamfered plinth and having a neck mould, cap mould and blocking course. The string courses, or weather moulds, over the windows are very similar in section throughout the district.

A special feature to which I would direct attention is the walling. This consists of square stones laid in courses varying in thickness from 2½ in. to about 7 in., with thick mortar joints, and having dressed quoins at the

angles. In a few examples larger stones with a dressed face have been used, notably at Cartledge Hall and in the later work at Holmesfield, but this class of work forms the exception rather than the rule. I propose to deal with the buildings in the order in which they would be seen during the course of a day's walk. The best point from which to start is Totley Station.

The first building to be reached is Woodthorpe Hall, situated on the hillside just below Holmesfield Wood. It might well be taken as a type of most of the houses in the district. The plan is L-shaped, only one wing being now inhabited; the other is used as a barn, &c., a fate only too common with portions of these houses. The building is two storeys high to the eaves, with a third storey in the roof, having windows in the main and smaller gables. These latter windows have been blocked up, possibly with a view of escaping the window tax. The gables have a plain chamfered coping, which returns a short distance horizontally over a projecting knee-stone; the detail of this latter is very characteristic. The chimneys are placed centrally over the ridges, but these, together with the roofing, have been renewed in recent years. The windows are without transoms and are of one, two, and three lights, with the weather mould carried along the two outer sides of the building as a string. The positions of the doors have been altered, but the old ones were placed near the ends of the two wings. They were exceedingly simple, having nothing beyond a chamfer on the jambs and head. There is a quiet, homely feeling about this building, coupled with a good proportion in the various parts which have always appealed to me very strongly.

A short distance along the lane from Woodthorpe is Fanshawgate. Little remains of the original homestead, but interest centres on two small buildings at the side of the garden. One of these is of three storeys and is approached from two levels, the lower from the field and the centre one from the garden; the upper storey appears to have been a dove-cote. Part of the old garden walls remain, together with the gate-posts, the outer pair of which are curious. The upper portion is carried on four balls of stone, and although it has stood for so many years there is a feeling of instability about it which is not desirable in such a position. The remaining posts are much better, and quite worthy of a sketch. Although so little now remains, Fanshawgate was once of much greater extent. Its owners, or their descendants, were of considerable importance in their time, one, Thomas Fanshawe, Remembrancer in the Court of Exchequer in the reign of Elizabeth, leaving money to found the Grammar School of Dronfield.

About a mile from Fanshawgate is Horsleygate. The Hall is quite a modern building, but, close at hand, there is another and smaller house interesting from the fact that in some cases the window mullions are moulded. There is a large barn here of an early date which is worthy of examination. Many of these old farm buildings present admirable examples of the use of simple materials, and should not be hurriedly passed in the search for those interesting bits of detail which are so dear to the heart of the average student.

UNTHANK HALL.

FANSHAW GATE.

Unthank Hall is also close at hand; it presents no features of exceptional novelty, but there is a picturesqueness in the grouping of the various buildings which renders it of interest. The chimneys show a very good example of one of the types I mentioned, that with the diagonal shafts. The interior contains some good plasterwork, of late character, but simple in design.

Near Unthank lies Barlow Woodseats. The house, now used as a farm, is large, and is stated to have been built by Arthur Mower, who died in 1652; the walls have been almost entirely covered with rough cast, and many alterations have been made from time to time. All traces of the original doorways have been removed. The windows are in some instances of five lights, with transoms, and many contain the original glazing, the glass in which is rough and uneven in texture and would not be clear enough to meet the wants of the present day. The proportions of the windows are good in themselves, but they appear small in relation to the wall surface; this may be due in a measure to the rough cast which covers the jointing of the walling, and further to the large scale of the gables as compared with the other buildings in the neighbourhood. The single chimney crowning one of the gables looks insecure, and its position in the design is far from happy. I understand there is an old oak staircase in the house stated to be in good preservation, but time did not permit me to make an examination. The old farm buildings also remain, and with their long unbroken ridge and broad wall surfaces they form a pleasing background to the more broken lines of the house. The yard is enclosed by high walls; at either end are large gateways having simple posts of good design. There is in existence a document which purports to be a copy of the original conveyance of Barlow Woodseats in 1360; it is short and to the point, and might be of interest to our legal friends.

About a mile and a half from Barlow Woodseats on the way towards Holmesfield is Cartledge (see inset sheet). Here there are two houses close together, the Hall and the Grange. The Grange entirely blocks the view towards the south from the windows of the Hall, and is stated to have been erected by a member of the Jolley family to spite a relative who then had possession of the Hall. This certainly seems a reasonable explanation for the existence of a house having its back set towards the front of another of earlier date, and at a distance of only thirty yards. The Grange does not present any special features of interest except, perhaps, the stone eaves-spout, erected to carry the rain-water away from the doorway. The effect of the windows is entirely spoilt by the heavy modern glazing. The house was unoc-

cupied at the time of my visit, and had a bare cold look as compared with the Hall adjoining it. This latter is perhaps the most complete example of old domestic work in the neighbourhood, certainly the most perfect in the district under review. It belonged to, and was erected by, the Wolstenholme family, probably, during the late Tudor period. Built of a coarse gritstone, having a dressed face and laid in deep courses, it presents a marked contrast to the usual walling of the district. Perhaps the most striking features of the exterior are the two large chimney-stacks on the west side. These project from the wall, and are reduced by weathering courses below the gables to oblong stacks each carrying two square shafts set diagonally: these shafts have been renewed, but the bases appear to be the original ones. There is a parapet wall connecting the two stacks with plain stone gargoyles to conduct the water from the roof; this is covered with stone slates and has a long gutter through the centre, a detail in which it differs from other and later buildings. The gables are in some instances devoid of coping, and the roof timbers show on the outside of the walls, a rather unusual feature in the neighbourhood. The windows on the ground floor have transoms, and these and the mullions have a small fillet at the inner edge of chamfer. All the windows are filled with lead lights, glazed in diamond panes, and have square iron bars on the inside. Pleasing as is the exterior of this house, it is inside where the greatest charm is experienced. The rooms almost throughout the lower floor are panelled in oak. This panelling is simple in design, and in some cases the upper panels are long and narrow and have low relief carving introduced. In the room which is entered directly from the porch, there is an old clock case, which is designed to form part of the panelling. The inner doors are in all

BARLOW WOODSEATS.

cases low, that in the drawing-room being not more than 6ft. in height. This room is in a very good state of preservation. The ceiling is divided down the centre by a beam having modelled ornament on the soffit and the cornice mould returned along the sides; one end of the beam is supported on a bracket extending the depth of the frieze. One compartment of the ceiling retains its moulded ribs; the pattern is good and is enriched by a profusion of modelled ornament, in which Tudor roses and twisted snakes are to be found. Round a portion of the room there is a modelled frieze, in which oak leaves appear to form the basis of design. Squirrels are also introduced, but the effect of successive coats of colour-wash renders the exact pattern a matter of conjecture. The lower parts of the walls are panelled. The room is low, being only 7ft. 6in. in height, but, in spite of modern regulations, this seemed sufficient for appearance. Perhaps the general proportions and panelling account for the feeling of satisfaction experienced.

There is an oak mantel in this room surrounding the moulded stone jambs and head of the fireplace. Two flat pilasters, carved with a conventional pattern of vine leaves and grapes, with caps of the Corinthian type (now, however, much mutilated) support an over-mantel. This contains two ranges of panels, the upper ones being long and narrow and carved in low relief. The lower panels are separated by flat pilasters; one of those on each side of the centre panel is carved with

a representation of a female figure, with a snake entwined around the body. The pilasters forming the outer edges of the design are carved with representations of men covered with hair and carrying clubs. The side panels of the lower range have moulded ribs enclosing a medallion in the centre, with four outer panels. The latter are carved in low relief, but the medallion is now plain; possibly at some time it contained the name or coat of arms of its first owner. The centre panel contains a richly-carved representation of the Temptation. In the centre is the tree with the serpent entwined around the trunk; on either side stand Adam and Eve. Ribbons containing inscriptions run up the side of the figures. That by the woman contains the words, "The serpent beguiled me," while the other states, "The woman gave me of it, and I did eat," in spite of which statement Adam appears to be helping himself to the fruit. At the foot of the tree sit two monkeys busily eating apples. The sides of the panel contain conventional vines, into which are introduced snails, squirrels, birds, and a dog or talbot. Across the top are wavy lines representing the sky; the sun occupies the centre and at the sides are stars. At some time this mantel has been blackleaded, a fate which frequently befel oakwork in this district.

On the upper floor is another room with panelling on the walls, and having a richly-decorated ceiling. This is coved in section,

CHIVERTON HOUSE, DRONFIELD.

lights with square mullions on the outside, although the chamfer is retained inside. A flat architrave of slight projection surrounds the windows; it has a hollow chamfer on the inner edge. The windows to the left of the door are built up, and as the staircase cuts across them at the inside I imagine that has always been their condition. The chief feature of interest is the doorway; this is very good in detail, and is surmounted by a segmental broken pediment, from which rises a large shield having twenty quarterings; above this are three helmets bearing crests of the Burton family, and from the centre helmet the mantling spreads and forms a finish to the design. The manner in which the carving of the helmets is executed is surprising. It is scarcely credible on first sight that they have been carried out in stone, the amount of undercutting is so great. The mantling is rich and bold in design, and forms an excellent relief to the finer carving of the coats on the shield. This doorway is executed in a finer-grained stone than the rest of the front. Below the shield on a ribbon is the motto "Virtus ardua vincit."

The back of the house still retains traces of an earlier date. It appears as if the south front were simply an insertion by the then owner to bring his house into the fashionable style of his day. Whatever the reason of the alteration, it has afforded us an example of the work of the period which is almost unique in

this neighbourhood. It is stated that before this alteration the house possessed a projecting wing on this front. The manner in which the design of the ceiling of the end room is cut into by the front wall certainly supports this theory. This ceiling is divided by beams into large panels. The cornice runs round them, and the flat has corner ornaments and a centre piece; these vary in design. The soffits of the beams have been richly ornamented, and had medallions at their intersections, but this ornament has in most instances disappeared. The walls are panelled in oak. This looks rather patchy, and has evidently been cut to fit its present position, probably when the room was altered. There is a fine overmantel, which has been treated in a barbarous manner and is now all daubed with paint. In spite of this, however, sufficient remains to show the design. The room contains many examples of old furniture and china, and is evidently a source of pride to the present occupants of the house.

About half a mile from Holmesfield is the village of Dronfield Woodhouse. The Hall, now a farmhouse, has a neglected appearance. It has undergone many alterations, some of the more modern of which are far from satisfactory. This house was formerly the residence of the Barlow family. Many of you, no doubt, remember the alabaster tomb in Dronfield Church, having on the top an effigy of a knight in armour. This was erected in memory

A CORNER IN HOLMESFIELD HALL.

and is ornamented by ribs in flowing lines, having modelled ornament in the spaces thus formed. There is great variety both in the ornament and contour of this ceiling, which removes it entirely out of the ordinary run. It may be instanced as an example of how a difficult situation was grappled with by these old builders and rendered an object of beauty instead of the abortion it might have become in the hands of less competent designers.

About a quarter of a mile from Cartledge, and close to the church, is Holmesfield Hall, at one time the residence of a branch of the Burton family. They were of considerable importance in the seventeenth century and furnished High Sheriffs of Derbyshire on several occasions. There is a date, 1613, in one of the rooms, and this may probably be taken as that of the original building. Many alterations have been made to this house from time to time, the last and most important being the rebuilding of the south front some time in the early part of the eighteenth century. This work is quite classical in feeling; the walling is of dressed stone laid in deep courses. There is a good moulded eaves-cornice, chopped off flush with the ends of the building; the roof was hipped at the same time. The windows are of three and four

HOLMESFIELD HALL.

HALLOWES HALL.

of Sir Richard Barley, or Barlow, of Dronfield Woodhouse. At a later date the house passed to a branch of the Eyre family, of Hassop. In spite of its neglected look, there is much of interest still connected with this old house. The lights of the windows are long and narrow, and are without transoms, except in the case of a wing added at a much later date. The principal feature of interest is the garden. On two sides of this are high brick walls against which fruit trees are trained, doors in these walls giving access to the garden; at the end opposite the house is a sunk fence, segmental in plan. In the centre of the garden is the pedestal of an old sundial, supported on two circular steps. It is extremely pleasing in proportion and design, and is a relic of the time when the architect was allowed to invade the garden, and was not merely supposed to prepare a shell for others to finish. Traces of the old paths exist, now grass-grown and neglected, but in spite of this sufficient remains to show their original design.

The road from Dronfield Woodhouse to Dronfield does not present any features of interest. It is not until the latter town is reached that buildings having any pretence of architectural treatment are found. Dronfield is familiar to most of us on account of the very fine chancel of its parish church, but apart from its church there is much in the town to interest the architect. In the upper part is the Manor House, a somewhat plain building having a hipped roof and a bold eaves-cornice. The windows on the front appear to have had their mullions and transoms removed, and sashes substituted. Those at the side retain these features. This house, like all the others I propose to deal with in Dronfield, is designed on symmetrical lines. The front has a central feature, in this case a projecting porch, and the two sides balance exactly. I understand that the house contains a fine oak staircase and also some ornamental plasterwork.

Quite close to the Manor House there is a small house which is now used as an inn. The plan is simple, an oblong 40ft. by 20ft., with a projecting wing at the back containing the staircase. The front is symmetrical, with a door in the centre and two windows on either side, a range of windows over, with single windows in the two gables. Parapet walls exist towards the front, from the gutters behind which the water was discharged by gargoyles. The principal feature is the doorway, which has raised and moulded blocks on the jambs. Inside there is a good staircase with turned balusters and square newels. The risers are only 6in. in depth, and the whole has a solid and substantial appearance. Unfortunately, at some time the oak has been covered by successive coats of paint. Close to the station are two buildings almost side by side, and both fronting towards the south. The one nearest Sheffield is Chiverton

House, a long, narrow building of two storeys to the eaves with a third storey in the roof. There are gables at the ends and a further one in the centre; at the ends of the front are small projecting wings with flat roofs; there is a further wing at the back containing the staircase—this is of oak and of a simple design, with square newels and a bold handrail. The rooms extend from front to back of the building, and all face towards the south; in the centre of the ground floor is a large hall, now used as a drawing-room. The outer door opens directly into this; a similar arrangement exists at the adjoining house. The two lower ranges of windows are of two lights, and have transoms, and from the detail appear rather late in date. The outer door of the kitchen has the initials, J. B. A., and the date, 1712, in a shield on the head. I am told that this is an insertion and that the building is much older, but there is nothing in the detail of the building which prevents the acceptance of this as the date of erection. There is a small court in front of the house approached by a flight of steps, the railings and gates are modern, but the posts, now covered with ivy, are no doubt the original ones.

The house adjoining Chiverton, and known as Rose Hill, was erected in 1717. It, like the others, has a symmetrical front, in which are two gables united by a parapet, with an open balustrade in the centre. The plan is simple, consisting originally of a long and narrow block in front with two projecting wings at

the back. The original doorway is in the centre of the front and leads into a square hall, now used as a sitting-room; at some time the space between the two back wings has been enclosed, and a new entrance formed at the end. The original doorway has a semi-circular pediment, in the tympanum of which is the date; probably at one time there was also a coat of arms or monogram, but all traces have now gone. The windows are long and low, and, with the exception of the one on the staircase, are without transoms. Many of the mullions have been removed, and wooden case-ments have in all cases been inserted. The openings diminish in width in each storey, but in each case the height is equal to twice the width. The label moulds are carried along as strings, and give a horizontal feeling to the whole. The chimneys are good examples of their type, that consisting of a square stack with plinth, necking, cornice and blocking course. They are placed centrally over the ridges, and have a weathered and throated string below the plinth to throw the water clear of the lower part. The general effect of the house when seen from the garden is not so good as I anticipated from the views previously obtained from the railway. The detail of the windows is thin and wiry; it may be that the stonework has been redressed at some time, but it has not the character of that found in the earlier examples. There is a simple staircase having flat-cut balusters, but apart from this little of interest is to be found inside the house.

Scattered about the town are numerous traces of work of a similar kind; there are also examples which illustrate almost the last stage of the use of windows having mullions and transoms. Quite close to the Manor House is one having a flat front with an open parapet or balustrade extending across its width. The windows have square mullions and transoms, and the proportions of the lights are bad. It looks like the work of a man out of sympathy with, or having an imperfect knowledge of, the style in which he attempted to build. The workmanship differs from that in the houses previously described, and I mention it as an instance rather for the purposes of comparison in the use of materials than as an example to admire. Close to the railway there is another house of similar date, but here a certain picturesqueness of grouping has crept in; possibly the natural instincts of the builder rose superior to the style of his day.

On the hill behind Dronfield is Hallowes Hall, or farm. The present building was erected in 1657 by the Morewood family, the initials of one of the members, probably Andrew, who died in 1678, appearing over one of the doorways. The plan of the building is like the letter H, the cross-piece forming a large entrance hall, with a door on each side; the one towards the south-west contains the date

ROSE HILL, DRONFIELD.

and is contemporary with the building, while that on the other side is of much later date and is a good example of the perfected Renaissance style. The broad flight of steps leading to this door, and extending across the space enclosed by the wings, gives great dignity to the approach. The detail of this doorway is almost identical with that at Holmesfield, and is probably the work of the same hand. In the tympanum is a coat of arms showing Lathom impaling Morewood. As a member of the Lathom family married the heiress of the Andrew Morewood previously mentioned about the year 1700, it is probable that this doorway dates from the early part of the eighteenth century, yet it is much superior in detail to others in Dronfield of that date.

The house differs slightly in character from those already described. The gables seem to have too much wall in proportion to window space to be altogether pleasing. Some of the rooms have their ceilings divided into panels by plastered beams, and until recently one of them was panelled in oak. This was removed some years ago, and accounts differ as to its ultimate destination.

The old garden walls are in position and traces of terraces may be seen. The ground rises from the south-west side of the house, and parallel with this front is a terrace wall having a semi-elliptical flight of steps opposite the centre of the doorway. These have a very pleasing appearance, and are probably contemporary with the doorway on the opposite side of the house. On one side of the lawn is a small square garden house having a hipped roof with a stone finial; there is a bold eaves-cornice and a short flight of steps leading to the doorway. The garden is now used as a paddock, but sufficient remains to afford suggestions for the treatment suitable to a sloping site.

About a mile from Hallowes is Unstone Hall. It lies close to the railway line and the back at least will be familiar to all. The portion now remaining was erected in 1653 by a branch of the Bullock family, whose coat of arms appears over the doorway. An older portion of the building, which has long been in a ruined state, has recently been pulled down to make way for some much-needed additions to the house. The roof is in one span with gables at the ends; on the projecting wing towards the west further gables rise from the eaves. The chimneys have the shafts set diagonally on a square base, one has four shafts and forms one of the best examples of this type in the district. The windows vary in design. Some on the ground floor have transoms, but these form an exception to the rule; the label moulds turn down and return a short distance along the walls in the manner customary in late Gothic times. Many of the windows retain their old lead glazing, and in some cases the old casements remain. The doorway is interesting, partly on account of the treatment of the jambs, where

UNSTONE HALL.

the manner of arranging the stones shows early evidence of Renaissance feeling, but more especially on account of the old oak door. This is studded with nails, and has its original wrought-iron hinges intact. The grouping and proportions of this house are excellent, and much may be learnt from the simplicity and restraint of the design, and from the manner in which the materials are used.

In conclusion, perhaps, I may be permitted to tender to the younger members of the architectural profession a few words of advice, not altogether out of place at the present day when cameras are so universal. I would urge them to rely more on measuring and sketching for the purposes of study, and less on the camera. The latter has its uses, but young students had better leave photography severely alone. Its practice is extremely fascinating, and tends to relegate the more useful measured work entirely into the background. It is by measuring and drawing to scale that we are able to analyse an old building, and see why its proportions appeal to us. I also strongly recommend that all measured work should be drawn to scale on the spot. This is imperative in the case of mouldings and ornament, and by no other methods can the details of jointing be accurately obtained.

The West Ham Picture Exhibition has been transferred to Stratford Town Hall, E.

Keystones.

New Church Buildings at Hirst, Morpeth, are being erected from the designs of Mr. Osborne Blythe by Mr. J. W. Braithwaite at a cost of £700.

For laying out an Estate at St. Albans an open competition was recently held, in which the first premium has been awarded to Mr. C. J. Fox, architect, of Newport, Mon.

A Spectacular Exhibition at Halifax is to be held during July and August next, and the first sod was recently cut for the lake (300ft. in length) which will be one of the chief features. The buildings are being pushed on with all speed.

A new Presbyterian Church at Whitley is being built from designs by Mr. Henry Gibson, of North Shields. Accommodation will be provided for 450 worshippers, and the walls are to be faced with red Ruabon bricks with black joints and Denwick stone dressings. Messrs. W. A. Fishburn and Co., of North Shields, are the contractors.

Extending the Wharves at Sydney, Australia.—As a precaution against the plague, the Cabinet has decided to resume the wharves from the head of Darling Harbour to Dawes Point, Sydney, about a mile and a half long, with a depth of 300ft. inland from the water-line. This includes about forty wharves and buildings. The cost is roughly estimated at £2,000,000.

A new Organ at Chelmsford Parish Church has been built by Messrs. Norman and Beard, of Norwich. A new roof for the nave is also contemplated. Mr. Chancellor has (gratuitously) acted as architect for the new roofs and other works which have been erected at the west end of the church, Mr. H. Potter, of Chelmsford, being the contractor, and Mr. Polley, of Coggeshall, the carver.

New Y.M.C.A. Premises at Totterdown, Bristol, have been built at the corner of Bushey Park from designs by Messrs. La Trobe and Weston, of Bristol. The buildings include branch premises for Messrs. Lloyd's Bank, Ltd., and have cost £6,200. In the public hall of the bank is a mosaic floor, the design of which is based on that of the recently discovered Roman villa at Brislington.

"The Architectural Review" for May will be a special number dealing with Architecture and Crafts at the Royal Academy. In order to make it as complete a record as possible, and to secure illustrations which otherwise it would have been necessary to omit, it has been thought well to delay publication until the end of this week. Subscribers will admit, we think, when they see this month's Review that it was worth waiting for.

DOORWAY, HALLOWES HALL.

Our Monthly Review.

Architecture (New York) for April is a somewhat better number than the previous one. The notes are of the usual chatty, interesting nature. We see that the bill to regulate the practice of architecture, prepared by the New Jersey architects, passed the legislature by a vote of 38 to 5, but, owing to its reaching the Senate during the last week of the session, was "held up." This means that by the absurd American political system the work will have to be done over again next year. The New Jersey architects have embodied in their bill the following: "But nothing herein contained shall be construed to prohibit students, or employees of licensed architects, from acting for or upon the authority of such licensed architects, or to prohibit any person in this State from acting as designer of any building that is to be constructed by himself or his employees." This section is stated to give them the support of all the small builders and country carpenters. It would, perhaps, be better if some such clear statement were made to this effect in the Bill promoted by the Registration Committee in this country, rather than let it remain in the indefinite character it has at present. In Canada the architects in the Province of Quebec have received recognition, and architecture is now a close profession; a licensing bill is being pushed in the Province of Ontario, and the Society of Civil Engineers also has a bill before the Ontario legislature to close the ranks of the profession to all but duly qualified persons. The Californian architects have a licensing bill before the legislature, the initial cost to be 25dols., and 5dols. per annum thereafter. The almost unanimous demand for licensing is, however, opposed in Cincinnati, Ohio, by the Local Chapter of the Institute of Architects, the arguments against registration being practically the same as those advanced by some old and zealous members of the R.I.B.A. here, that the Institute is capable of doing wholly within the limits of the profession all that the advocates of a licensing law propose to do by statute. Of course, this is as much a fallacy in this country as in the United States, where the American Institute is out-numbered by the members of local architectural associations by ten to one. The illustrations are greatly better than in the previous number. Swateley Hall, Uxbridge, and Ham House, Petersham, two well-known old country mansions of ours, are illustrated; but the garden at Bowood, Wilts, has an unpleasant air of artificiality. The Pratt Mausoleum at Glen Cove, L.I., is a dumpy, heavy-looking structure. The interior seems somewhat impressive in the illustration, which is too dim to show the detail; but as the roof is probably mosaic, with a large amount of gold, the actual effect would be appalling. The illustrations of interiors in the Court House, Appellate Division Supreme Court, Twenty-fifth Street and Madison Avenue, New York (Mr. James Brown Lord, architect), should be a revelation and a reproach to our governmental authorities. The work is most sumptuous for a public building, and on the whole successful, but the large panels in the Court Room are not quite architectonic—the atmosphere and perspective gives them the appearance of openings in the wall.

The American Architect for March 31st contains nothing of great interest in the matter of letterpress. The buildings illustrated are on the whole better than usual. The house in East Seventy-ninth Street, Corner of Fifth Avenue, New York, is a nightmare of Gothic forms, without the slightest glimmer of the Gothic spirit. St. Gabriel's College, Camberwell, S.E. (Mr. Philip A. Robson, architect), is a happy attempt at simplicity, without any attempt at the usual "architectural effect." The depot at Seattle, Washington, for the Northern Pacific Railway Company (Cass Gilbert, architect), is a neat little French Classic erection, the only thing against it being the detail, which is, however, small, and the iron and glass utilitarian shelter on the front—we are still waiting

to see this feature dealt with in an architectural manner. The number for April 7th contains much interesting information. "It is rather curious," says an editorial note, "that an American city of the size of New York should be decorated with so few pieces of bad statuary. We do not mean few in comparison with the number of statues actually erected, but few when one considers how many more bad ones there might easily be." We wish this sensible comment were equally true of London. Mr. Wallace C. Sabine gives in this number the first of a series of papers on "Architectural Acoustics" that promises to be of considerable value. Illustrations are given of the West Ham Technical Institute by Gibson and Russell, architects. The house, No. 923, Fifth Avenue, New York, shows a beautiful and suggestive use of caryatides in the top storey, but below the same careful taste has not been used. The first floor window treatment shows a fault somewhat common at the present time—the decoration of constructional members doing work, or presumably doing work. In this case panels have been carved in somewhat high relief in the pilasters on the piers; this use is passable in very low relief, or in parts visibly doing no work, but is generally better left plain. The Botanical Museum, Bronx Park, New York, is an instance of want of scale, produced by the use of a large order extending up two storeys; there is plenty of precedent for this but no excuse. The balustrading with the crossed members in the form of Union Jacks, is also distressing. The house at Jamestown, R.I. (Creighton Withers, architect), is a good instance of the pleasing effect to be derived from the mere use of proportion and mass without traditional forms. The issue for April 14th illustrates the Hackney Branch of the London and Provincial Bank, a heavy, ungainly structure, full of dumpy columns, giving evidence on every hand of striving after effect and "novelty." The design for the Church of the English Martyrs, Walworth, is to be commended as Gothic, but—if we might say so—too much of it, with the row of roofs over the shrine and the buttresses starting from over the arched entrance. In the issue for April 21st the second part of the paper on architectural acoustics is given. The illustrations are of interest, and include views of two commonplace houses at Nottingham and one at Putney.

Feilden's Magazine for May concludes the articles on compound and four-cylinder locomotives in England and France, modern appliances in gas manufacture, pneumatic tools and appliances, and the building of the Great Central Railway extension to London. In view of the interest aroused of late in regard to municipal tramways, and also in regard to electric traction, the article on the tramway system of Glasgow and its transition from horse to electric traction by Mr Benjamin Taylor, F.R.G.S., will be of special interest. The usual number of interesting paragraphs and short articles are given, but call for no special comment, except that we may recommend manufacturers to take the advice given in the note on some British commercial characteristics to heart.

The Journal of Decorative Art this month contains a valuable article on the manufacture of furniture in Italy by Professor Alfredo Melani, and an address delivered by Professor Baldwin Brown on "John Ruskin and William Morris," with other short notes on subjects of interest to painters and decorators. The design for a vestibule wall given away as a plate in colours is about equal to the general house-painter's idea of decoration, but perfectly horrible.

The Irish Builder for April 15th and May 1st contains an article on the high death-rate in Dublin by Mr. J. P. Doyle, M.D., but it cannot be said that it brings the solution of the problem any nearer, while the plentiful vituperation bestowed upon Trade Unionism, the Poor Law system, and the public spirit displayed by persons in endeavouring to be on the local authorities is quite irrelevant, and destructive of any attention that might have

been paid to the author's opinions on the technical side of this question. Mr. Middleton's articles on "Classic Details and their Application," are continued, and the notes on current matters are of usual interest. St. Carthagh's Church, Lismore, illustrated in the number for April 15th, is good in mass but very bad in detail, and the stone dressings are distressing.

The Church Builder.—The April issue of this quarterly gives the finance reports of the Church Building Society, with accounts of the building works contributed to. Illustrated descriptions are given of Thaxted and its Church; St. Mark's Church, at Harrogate; and St. Luke's Mission Church, Cobholm Island, Great Yarmouth. A number of appeals for funds for new churches, restorations and repairs concludes the number.

The Furnisher.—One does not look to a trade journal as a rule for matter of artistic interest; but the "Furnisher" is an exception to the general rule. The April number contains, with a great deal that is of exclusively trade interest, several articles that should appeal to all who are interested (and who is not?) in furnishing and decoration. Mr. F. Hamilton Jackson writing on "Museum Specimens as a Help to Designers and Manufacturers," gives some hints on the sources of inspiration which are open to all manufacturers, and which it is devoutly to be wished they would more generally and more wisely use. Several photographs of interesting examples at South Kensington Museum illustrate this paper. Mr. Oscar Parker calls attention to what he calls "The Renaissance of Wood Bedsteads"; he recognises the superior artistic possibilities of wood as compared with metal, but judging from the illustrations accompanying his article, these possibilities have as yet been very imperfectly appreciated by manufacturers and designers. Mr. Parker concludes with a very sensible and practical warning, which may well be laid to heart by those who wish to foster this excellent innovation in house furnishing: "If wood bedsteads are to have a vogue again," he says, "they must not only come into competition on the merits of their designs, but every care must be taken in their framing. Firm, unyielding joints are a *sine quâ non*, for a crevice means an inviting domicile for vermin. The best chance for wood lies in the fact that brass bedsteads have reached an almost prohibitive price; but if manufacturers take this perhaps transient condition as an excuse for placing on the market ill-constructed wood bedsteads, which will prematurely fall into decay, they will not lay the foundations of a growing trade. Nor will they appeal to the best taste unless they fully break away from the traditions that so long ruled bedstead designing, and realise that wood must be treated after its kind, and with a direct reference to the purpose of its use."

St. George, the Journal of the Ruskin Society of Birmingham, is a little quarterly that always contains something of genuine artistic or literary interest. The papers read before the Birmingham Society are never wholly banal, and they often—as in the case of Professor E. York Powell's address on John Ruskin in the current number—reach a very high standard. Professor Powell's appreciation is the more valuable that it is not an indiscriminating eulogy; he would have us follow the Master, but studiously, sanely, not as blind, unreasoning zealots. "Faults, shortcomings, errors, and prejudices he had, of course; are they not set forth in his writings? But in what man of his intellectual rank are these faults so little hurtful, so easily recognised, so simply avoided, for sure as he was of the business he had to do, he lets us see everywhere in his work that these dust specks on the mirror are but momentary blurs in its clear reflections." Prof. Powell's article, and the succeeding one by Sir Wyke Bayliss on "The Master and his Creed," should be read by every young and enthusiastic Ruskinian; both writers are devout admirers of Ruskin, but both see clearly that the best discipleship is not the acceptance of all the opinions of the Master, but the assimilation of his spirit. The present issue is

a "Ruskin Memorial Number," and contains, in addition to the two articles mentioned, poems in memoriam by Mr. A. E. Fletcher and the Rev. Canon Rawnsley (these have already, we think, appeared elsewhere), an article on Ruskin by S. D. Paoletti—an interesting expression of an Italian view of "The Apostle of Beauty"—a note on a very successful experiment in conducting a modern business on Ruskinian principles, and several other interesting items.

The Antiquary this month contains articles on the Churches of Farmagusta, the font of Lenton Priory, and other articles of antiquarian interest. The font of Lenton Priory, Notts, is now in use at the new Church of the Holy Trinity at Lenton, which had been built and was consecrated in 1842, at which time the font, which had previously been in the garden of Lieut.-Col. Stretton, was given to the church by him. Lenton Priory dates from the reign of Henry I.—1100-1135—but there are now no remains of it except a base of one of the massive round pillars of the nave, and upon it three courses of the masonry and this old font.

The Birmingham Magazine of Arts and Industries this month has articles on the Governors of the City of Birmingham, the brass foundry of Messrs. James Cartland and Son at Birmingham, and the leading Gunmakers of Birmingham, with a number of reviews of books and exhibitions. The illustrations are extremely well produced.

The Slate Trade Gazette for April makes its appearance again after an interval of five months, due to financial difficulties of the printers, in whose hands were the blocks, &c., which could not be obtained without great delay, notwithstanding appeals to the official receiver. The illness of the editor, Mr. J. Townsley, also has been responsible for a short further delay, but it is his intention to issue the subsequent parts in quick succession. This number has an article on Mr. Joseph Borthwick Johnson, a well-known member of the slate trade, and a report of the Seventh Annual Congress at Liverpool, with various other notes of interest. We would call attention to the fund opened to raise £1000 for furthering the objects of the National Association of Slate Merchants and Slaters. The Gazette announced that the fund has now reached £410 12s. 6d.

The British Clayworker for April continues the articles on brick-earths of Northamptonshire, and brick drying. A short article deals with peat coal, a new artificial fuel, the advantages claimed for it over ordinary coal being: (1) That it is easier to handle; (2) that it is easily lighted and requires less draught; (3) that it burns with a long flame and gives greater heat, and in consequence of rapid combustion will raise steam more quickly; and (4) that it gives less smoke and no fumes. Some brickwork by the late W. Butterfield is dealt with and illustrated. The advice to architects to study the advantages of different kinds of bricks is well worthy of attention. A number of other short articles and notes make up a most interesting number.

The House.—The articles in the number for May that are likely to concern our readers are illustrated accounts of some furniture sold at Christie's, some Old English silver and French china. The decoration of the dining-room at the Palace at Darmstadt, designed by Mr. M. H. Baillie Scott is illustrated, and in the section devoted to Home Arts and Crafts a number of designs are given for stencilled friezes, overmantel, cupboard, art needlework, art metal work, leather or poker work, and wood carving. The article devoted to "Pretty Rooms and what they Cost," shows some interiors of the usual riverside-bungalow type—a few wicker chairs, a pillow or two, a Japanese fan and lantern, and a few china or earthenware pots and ornaments—a bric-à-brac medley.

The Journal of the British Institute of Certified Carpenters has issued its first number for April. This number contains a goodly number of short articles and paragraphs on practical, and other subjects of an

interesting and useful, character. Mr. S. Wickford Potter writes on some improved materials used in modern sanitary work; Mr. Henry Phillips on the duties of a building surveyor; Mr. James Marsden on the materials we build with; Mr. James Clark on Graphic Statics; and Mr. T. M. G. Lloyd gives some notes on East Anglian Churches. Mr. William M. Dixon gives a design for a half-timbered gable, and a note on the late President of the Institute, Professor Banister Fletcher, is illustrated with a portrait. The price of the journal to non-members is 4d.

The R.I.B.A. Journal for April 7th contains in full the papers on working-class dwellings, read before the institution by Mr. John Honeyman, Mr. Henry Spalding, Mr. W. E. Wallis and Mr. Owen Fleming, summaries of which have already appeared in our columns. The number for April 28th gives in full the paper on "The Protection of Public Buildings from Lightning," by Mr. Killingworth Hedges, with illustrations.

The Engineering Times this month continues the articles on modern methods of saving labour in gasworks, and on the history and development of motor-cars. Mr. A. Wynter Blyth makes a contribution to the much-discussed question of the disposal of sewage; and there is another article somewhat in relation to this on the destruction of town's refuse. Mr. John Wilson writes on a very entertaining and novel feat above the clouds—the transportation of a twin-screw steamer from the yard of Messrs. William Denny and Bros., engineers, at Dumbarton, and its subsequent rebuilding on Lake Titicaca, the sacred lake of the Incas, 13,000ft. above sea-level.

The Quarry contains illustrated articles on the porphyry quarries of Lessines, and the mineral industry of Yorkshire, with a coloured plate showing the strata. The article on cranes and other lifting and transporting machinery and appliances is concluded.

The Artist this month has a new feature that makes it extremely interesting. This feature is the reproduction of a large number of studies for pictures now in the Royal Academy exhibition or intended for the New Gallery and other Spring exhibitions. A study is always interesting, but these are very opportune, and the idea of publishing them is a novel one. There are also in this issue illustrated notes from various art centres, and a paper by Mr. A. G. Paulson Townsend on design for embroidery.

Carpentry and Building (New York) has in the May number articles on wood-turning, making of wood patterns, protection of iron construction from corrosion, and on stone cutting. There are also a number of designs and details for a window frame for a circular tower, small wood-working shops, floor and roof truss construction, a cow barn, a frame barn, and other constructional work.

The Galeries de la Charite, Paris, which have been erected to replace the ill-fated Bazar de la Charité, have just been inaugurated. The building is situated at 25, Rue Pierre Charron, close to the Champs Elysées, and has a certain architectural analogy to the palace constructed by the Comte and Comtesse de Castellane in the Avenue du Bois de Boulogne.

Messrs. Adams and Williams is the style of the firm which has been formed by the partnership of Mr. Hal Williams with Professor Henry Adams, M.I.C.E., M.I.M.E., F.S.I., &c., of 60, Queen Victoria Street, E.C., (which will be the address of the firm). Mr. Williams was for some time with the Haslam Foundry and Engineering Co., Limited, of Derby, and has recently been with Messrs. Sir Frederick Bramwell, Bart., and H. Graham Harris, consulting engineers, of Westminster, to which firm he was principal assistant. Messrs. Adams and Williams are prepared particularly to report and advise on power for factories and workshops, electric lighting and power installations, brewery work, refrigeration and drainage and water supply.

FOOTWAYS and CARRIAGEWAYS.

AN INTERESTING CASE.

THE case of *Robertson v. The Mayor, &c.*, of Bristol, which was heard in the Court of Appeal on May 1st, was the plaintiff's appeal from a judgment of Mr. Justice Grantham in an action tried before him without a jury at Bristol on February 23rd, 1899. The plaintiff claimed an injunction to restrain the defendants from removing certain kerbing and paving laid by the plaintiff in Robertson Road, St. George's, a suburb of Bristol, and formerly under the jurisdiction of an urban district council. The plaintiff was owner of a building estate in St. George's, upon which he had laid out a wide road called after him Robertson Road. The by-laws of the Urban District Council prescribed that an owner laying out a building estate should submit plans showing roads of a width of 36ft. in all, including the carriage-way and two footways, each of the footways being one-sixth of the total width; in other words, that the carriage-way should be 24ft. wide and each of the footways 6ft. wide. The plaintiff deposited plans, marking out Robertson Road and showing it to be of greater width than 36ft. Part of that road was in fact designed to be of a width of 45ft., having a carriage-way of 30ft. and two footways of 7ft. 6in. each, and the remainder of a width of 40ft., having a carriage-way of 27ft. and footways of 6ft. 6in. each. These plans were submitted to the Urban District Council in 1891 and 1892, and were approved by the Council. The road was laid out and dedicated to the public, but had not been taken over by the highway authority. On October 31st, 1897, the Bristol Extension Act came into operation, and by that Act the district of St. George's became part of the City of Bristol, and came under the jurisdiction of the defendants, who were minded to take over the roads in that district and to make them repairable by the public under section 150 of the Public Health Act, 1875. They accordingly served notices on the owners of houses fronting Robertson Road, but not on the plaintiff, annexing to the notices plans which showed their intention of turning part of the footways into the carriage way. Having served these notices, the defendants commenced the work and began to alter the footway as notified. The plaintiff thereupon threatened proceedings, and subsequently issued a writ claiming the injunction as above stated. The defendants justified their action under section 150 of the Public Health Act, asserting that the right and duty of deciding how much of a public road should consist of footway and how much of carriage-way were vested in them as the highway authority. Section 150 of the Public Health Act, 1875, enacts that, where any street within an urban district (not being a highway repairable by the inhabitants at large), or the carriage-way, footway, or any other part of such street, is not sewered, levelled, paved, or made good to the satisfaction of the urban authority, such authority may, by notice to the respective owners or occupiers of premises fronting such parts as may require to be made good, require them to make good the same within a time specified in such notice. If the notice is not complied with the urban authority may execute the necessary works themselves. Mr. Justice Grantham gave judgment for the defendants, holding that when a local authority takes over a street they have power under section 150 of the Public Health Act, 1875, to deal with the carriage-way and the footways as they think best in the public interest. From this decision the plaintiff appealed.—It was contended for the plaintiff that there was no power given to the defendants by the Public Health Act to change a footway or any part thereof into a carriage-way. The road must be taken over as it was dedicated. The soil of the road was still vested in the plaintiff as owner, and if an owner chose to dedicate a footway there was no power, except by an order of quarter sessions, to convert it into a carriage-way.—The Court of Appeal allowed the appeal. Lord Justice A. L. Smith, in giving judgment,

said that the plaintiff had an undoubted right to dedicate a footpath 7ft. 6in. wide; but the Corporation contended that section 150 of the Public Health Act, 1875, justified them in altering the road as dedicated, and enabled them to dedicate to passengers by carriage what the plaintiff had already dedicated to foot passengers. Section 150 gave no such power as the defendants claimed, or in any way enabled them to change a footway into a carriage-way, or a carriage-way into a footway. Mr. Justice Grantham had held that when a street has been laid out and taken over by a local authority that authority had power to deal with it as they might think best for the public interest; but no such power was to be found conferred by section 150. Under that section the local authority must deal with the street as they found it. That was the street which they were empowered to sewer, metal, pave and make good. In this case plans had been deposited showing the relative proportions of footways and carriage-way, and these plans had been approved. It was the street laid out in accordance with those approved plans that the Corporation had power to make good, and no section gave them power to alter the respective proportions and make good a street different from that which they had approved. The appeal must therefore be allowed.—Lord Justice Vaughan Williams and Lord Justice Romer delivered judgment to the same effect.

THE OLD MASTERS AND THEIR LIMITATIONS.

IN the school of art of a great commercial city like Glasgow, said Sir John Stirling-Maxwell, M.P., at the recent prize distribution at the Glasgow School of Art, their thoughts naturally turned to other commercial cities of the past and their schools of art. They thought of Florence, of Venice, and even of Greece and Athens, and as these cities grew in power and wealth they grew also in their produce of works of art. Now the power and wealth had gone from these and many other cities famous in their day, but their work remained as a precious legacy. When attempting a comparison between the past and the present he could not help asking the question whether the schools to which we looked for our monuments of works of art realised anything like the same conditions under which the great masters of former times grew up. He would not attempt to answer the question, as that would take up too much time; but there was one single aspect of the question at which they might glance for a moment. It would be fair, he thought, to divide the multifarious subjects which found a place in the schools into two heads—the practical, and what he would call the historical, the study of the works of art of the past. Of the value of the practical side there could be no doubt. Every hour that was spent with brush or pencil, graver or needle, chisel, or any other instrument, or the time spent in studying anatomy or the antique, or in the more interesting and difficult struggle of the life school, was not wasted. But when they came to the other part, which formed part of the curriculum of the school, grave doubts might perhaps assail them. It was not too much to say that what with casts and books and photographs and engravings, every work of art of the past which survived, and a great many which did not now survive, were within the reach of the students in a well-equipped school like Glasgow's. That was an advantage which was not possessed by any of those whom they called the great masters of the past. And he could not help asking whether that new advantage was really an advantage. Confining his attention to painting and sculpture, Sir John said let them compare a student modelling here with Phidias, the famous Greek sculptor, whose works adorned the Parthenon. That work had never been surpassed, and if these new advantages were advantages, what a tremendous gain the students of to-day had over him. The present-

day student had all the work that had been done by Phidias and all that had been done since, which, he supposed, included nearly every work of sculpture which we admired. Besides that, the student had also a great deal of that which existed in the days of Phidias, and which in all probability Phidias never saw. He had the sculpture of the Hittites and the Assyrians, which had certain merits that were never surpassed by the Greeks, he had the sculpture of Egypt, and he had also that of the Buddhists of India. In these circumstances he thought he was justified in saying that we now probably knew more about Archaic Greek studies than Phidias himself. That was a curious contrast, and there was no doubt it led one to the opinion that Phidias must have depended mainly on Nature and upon the human form divine, and though he must have learned something from those who went before him, he must for himself have made and found out many of those generalisations, those additions and omissions, which made the difference between the Greek statue and a petrified human being. If they turned to painting the same would perhaps be even more true. For the sake of comparison he would take Raphael—a painter of recognised merit—and when they thought of the amount of work that had been done since his day by men like Titian, Velasquez, and Turner, and when he remembered the work of Italy, those paintings and mosaics which were buried under the lava of Vesuvius, and those casts which had been disinterred in Egypt, he felt how much there was within the grasp of the modern student which was entirely cut off from men like Raphael, who, there was reason to believe, had not seen anything like all the great works of his contemporaries. He thought they might fairly say that the great masters of the past, down through all the ages till the beginning of this century, produced their great works of art with great skill and infinite pains but with a very limited knowledge of the works of others; and the high ideals at which they aimed, and the extraordinary advance which many of them made in their comparatively short lives must be due to the fact that they always turned their eyes to that unattainable but inspiring standard which Nature always held up to the eye of the true artist. When he came to consider what had been the result to our own generation of all that accumulation of the works of art of other times he came to the conclusion that for some all these models would be a great advantage, and for others a great disadvantage. He believed they had been a great disadvantage to what he might call the small fry. He thought there were a great many people who could produce very good work if they were left to themselves, but many of them got swamped in all those riches and were weighed down with the knowledge at their hand. It was a comfort to know that there were great spirits who could choose what they wanted and cast aside what they did not want, and who could take such short cuts as enabled them to do more in the short compass of their lives than other artists would be able to do. He implored the students to look after their own individualities. If they felt strong enough to stand alone he would ask them not to be tempted to lean upon anyone else; and if they did not feel strong enough to stand alone then he would ask them to make up their minds what support they were to take, and lean on one person and not on everybody; because the bad stuff that had been produced in our generation had mostly been produced by a bad combination of things that ought not to have been combined.

New Leeds Restaurant.—The Midland Railway Company have provided an up-to-date restaurant in the new wing which has been added to the Queen's Hotel at Leeds. The restaurant is 40ft. long and 30ft. wide, and on the walls are some panels executed by Mr. Kutzon M. Borglum. The whole room is Louis Quinze in character. It is the intention of the Company to completely re-organise the interior portion of the whole building by the construction of an Italian Renaissance lounge in marble, &c.

STRENGTH OF TIMBER AND HOW TO TEST IT.*

By T. HUDSON BEARE, B.Sc., M.I.C.E.

SCATTERED through the older text books, through the proceedings of various societies, and in other works will be found an immense mass of experimental results of mechanical tests of various kinds of timbers, including all the various timbers used in constructional work. Unfortunately many of these figures are not very reliable, and if used in any calculations require to be used with the utmost circumspection and caution. The reasons for this statement are that:—(1.) The tests were in almost every case carried out on specimens of very small sizes, and often it is quite clear the specimens were selected with great care and freedom from all knots and blemishes and were thus by no means fairly representative of the average quality of the particular timber experimented on. (2.) From the unfortunately very loose way in which various timbers are named on the market it is sometimes impossible to know now what the timber was which was tested. (3.) In no case, as far as I know, were any observations made to determine the amount of moisture in the timber at the time of the test, in most cases not even the time of seasoning was given, nor time of felling, &c. Now the moisture condition is the vital factor in determining the mechanical properties of timber.

The first tests in which careful observations were made, both as to moisture, condition and previous history of the timber, were those made by the late Prof. Bauschinger at Munich, in 1883, the results being published in "Mittheilungen aus dem Mechanisch-Technischen Laboratorium in Polytechnischen Schule in München," 1883 and 1887. He investigated very fully the influence of moisture on the strength, both as regards crushing and cross-bending, by drying the specimens in a current of dry, warm air at a temperature of 101 deg. C. (= 214 deg. F.) for about eight hours, and finding the loss of weight by careful weighings. He eventually selected 15 per cent. as a standard of moisture to which all results should be reduced. (Timber in a dry, well-warmed house has probably about 10 per cent. of moisture). The law of relation of strength to moisture was readily determined by making three tests of the same stack of timber, the three specimens cut from it being of different degrees of dryness.

The next great series of tests were made on behalf of the Forest Department of the Board of Agriculture of the United States from 1891-1895. The experiments were made as to the mechanical tests by Prof. Johnson, while all the timbers were examined carefully as to their cellular structure, at Washington, by expert botanists. As in Bauschinger's tests, to whom entirely belongs the credit of establishing a rational system of timber testing, very careful determinations were made of the moisture conditions of the tested bars, and it was again found that the moisture condition was the vital one in determining the strength of the timber.

Johnson's crushing tests of similar material seem to show that the greatest strength is reached, not when the wood is absolutely dry, but with some 3 or 4 degrees of moisture. It is somewhat difficult to ascertain this with perfect accuracy, as absolutely dry wood rapidly re-absorbs moisture from the air; it is, however, not a point of practical importance, as such dryness condition as 3 degrees is never found in actual practice.

Another point, however, of much greater practical importance brought out by these tests was that re-absorbed moisture has the same effect in weakening the timber as the original sap. He found as a general rule strength with 12 degrees moisture was with all species 75 degrees greater than when "green." This, of course, is of importance in such cases as timber in use under ground, in damp situations where no means are taken to

* Summary of paper read at Carpenters' Hall, May 3rd.

prevent the absorption of the water. The results of these tests for variation of strength with variation of moisture indicate clearly enough that increase of moisture beyond a certain amount has little effect, the reason being that we are then merely filling the cells themselves; and similarly when drying the strength begins rapidly to increase when the walls themselves begin to dry; this occurs in the case of pines at about 33 degrees moisture.

Another question investigated in these tests was whether or not "bleeding" or tapping for turpentine the so called "pitch pine" had any harmful effect upon its mechanical properties; the experiments showed as a result of over 1300 separate tests no such result—the mechanical properties were apparently not in any way injured. The effect of rapid seasoning was also investigated, and here again no injurious effects were produced by this process as usually carried out with currents of hot air.

Tension Experiments.

Tension experiments are very difficult to carry out, owing to the fact that the specimens so frequently give way in shear by drawing out the part held in the shackles. The results of different experiments vary very much, partly from this cause, and partly because the specimens being necessarily small, great influence of original differences in quality are shown. The tenacity, however, appears to be relatively great, especially when one considers the porous nature of timber.

Bauschinger found that the Elastic Limit practically coincided with the breaking-point; while apparently the influence of time of felling soon disappeared.

Compression.

It is much easier to carry out crushing tests, easier to make specimens, and easier to get concordant results.

Bauschinger concluded that when the average quality of a timber (as in enquiries as to effect of time of felling, soil, climate, &c.) was being determined, then pressure tests were best. He advises cutting 3 discs from the two ends and the centre of a log, then dividing each of these into 4 sections and from each of these cutting a square prism of length about $1\frac{1}{2}$ times its side. These prisms should be crushed at a standard dryness of 15%, and their density determined by weighing and measuring. For pine woods the strengths of short columns gives the crushing strength in tons = density $\times 6.35 - 6.35$.

In Lanza's Tests, a large number of posts 7in. and 10in. diameter, mostly 12ft. long, all gave way by pure compression.

Another big series made at the Watertown Arsenal in the U.S.A. on struts of considerable length show markedly the same condition of affairs as with iron and steel, in that there is an enormous reduction of strength with increase of length. These Watertown tests were apparently on green timbers, but data are not known. In several cases three pieces were bolted and keyed together to act as one, but in no case did they show a greater strength per square inch (they were all 15ft. long) than single pieces, though they ought, according to strut formulae, as they had their least dimension increased—in fact they buckled out in same plane as a single one.

Johnson cut off pieces 8in. long from four sticks (ends of sticks tested as beams). He noted that after the shearing in of one end, its strength is only 80 per cent. of original strength. He advises a factor of safety of 8 for dry, 5 for green.

Not many experiments have been made to determine the crushing strength across the grain, such as frequently happens when a piece of vertical timber stands upon a horizontal piece, thus transmitting a load to it. It is, of course, rather a matter of judgment to decide what is the crushing load, i.e., what indentation to take as the limit; some give $\frac{1}{8}$ in.

Johnson takes 3 per cent. compression as working limit, or $\frac{3 \times 12}{100} = \frac{36}{100}$ in. in a foot-thick bar, and 15 per cent. as destructive, = $1\frac{1}{2}$ in. in a 12in. bar. He only worked with specimens

2in. to 4in. thick. He found a value in the case of pines on an average of 1,400 lbs. per sq. inch, as against 7,000 lbs. with green, or only $\frac{1}{5}$. With American oaks the figures were 2,300 lbs. sq. inch and 7,500 lbs. per sq. inch, or about $\frac{1}{3}$. These figures prove the extreme importance of paying attention to this point in designing any structure or temporary timber erection.

Cross-Bending.

This is a favourite form of test, partly because very large pieces with big spans can be readily tested without requiring very big loads; in fact it is a test which can be readily carried out on a job with but little trouble or expense. Two knife edges, or supports, a cradle to carry weights, and some pig iron or other lumps of iron for weights are required, while a stretched cord and a 2ft. rule readily enable the strains or deflections to be measured.

It is perhaps well to point out here that the calculated stress in the outer fibre deduced from the ordinary formula for beams is only the real stress in the case where the load does not exceed the elastic limit, beyond that the formula does not hold.

Johnson has shown by cutting up his large sticks into smaller ones, that under conditions of moisture of same character, little sticks have the same strength as big ones; only the temptation to pick out specially good small samples is usually too great to allow such tests to be fair averages.

One general result of Bauschinger's tests, verified also by Johnson, was that strength is much affected by the ratio of summer (solid) to spring (open) growth in each annual ring—or in other words, that the specific gravity is the determining factor. Bauschinger from his results deduced the law that B (crushing strength in tons per sq. in.) = 6.358 (density) - 6.35 at 15 deg. moisture.

Johnson similarly found that for all timbers dealt with in his experiments (except in case of oak, which, from its complex cellular structure, seems an exception), the strength rises steadily with density, i.e., with increase of specific gravity.

Shear.

In large numbers of beam tests, the beams actually give way by shear along the neutral axis, which may become very great. In Lanza's tests eleven beams gave way like this, the shear stress per square inch being equal to the stress in the case of those which actually tore fairly across, so apparently they may in case of soft woods give way in either fashion.

Johnson's results were somewhat higher, these being accounted for by a special shear test, fixing breakage at a particular section, while in beam it selects the weakest plane near the neutral axis.

Time in Testing.

I always find in bending tests and crushing tests that when a certain load is reached material will go on steadily yielding, i.e., the strain goes on increasing, and no doubt rupture would occur at loads less than the final one, if the load was only left on long enough. Prof. Thurston in a striking series of tests on bars 1in. square on supports 40in. apart found the centre breaking load rapidly applied 375lbs., the deflection being 1.8in. On three bars he had 250lbs. placed upon them, and all broke in from 6,000 to 11,000 hours (= 250-460 days), with a deflection of 2.5in. With less weight than that rupture did not occur under prolonged testing. From these results we see that 60 per cent. of the final load will produce rupture.

In conclusion, I would say that in most cases where much timber is to be used, it is better and safer to make fresh tests of the actual stuff to be used, rather than to rely upon old figures.

The Grand Palais des Beaux Arts at the Paris Exhibition was opened on May 1st. It contains three separate exhibitions. The first is an exhibition of French art during this century, the second is an exhibition of French art during the last decade, and the third is an exhibition of foreign art.

"BUILDERS' JOURNAL" SHILLING FUND.

WE propose to close our subscription list on Monday, May 21st. We shall be glad, therefore, if those of our readers who still have our collecting forms will send them in before that date. Our fund now amounts to 2728 shillings, and we are very desirous of reaching 3,000 shillings before closing the lists. Will our readers make a final effort to enable us to achieve that result?

We have received a few further subscriptions since the publication of our last list, and these will be acknowledged in a future number.

In view of the frequency with which the general decorative upkeep and repair of buildings owned by charities is neglected, a special *matinée* is now being arranged at the Theatre Royal, Drury Lane, for May 15th, with a view of collecting a few thousand pounds to be invested with the specific object of creating a fund from which sufficient moneys can be drawn annually to keep the homes presented by the building trades in a thoroughly creditable condition. Her Majesty the Queen, who takes a great interest in the Building Trades' Scheme, immediately ordered a row of stalls, whilst Mr. Cecil Rhodes paid £500 for a box, and the Duke of Bedford sent £100 for the box which he really owns as the landlord of the theatre.

The programme of the *matinée* is not yet complete, but we are enabled to announce that "Trial by Jury" will be given, in which Lady Bancroft, Misses Lucille Hill, Phyllis Broughton and Florence St. John, Mesdames Belle Cole and Fanny Moody, Messrs. W. S. Gilbert, Rutland Barrington, Walter Passmore, Sydney Grundy, Eric Lewis, C. Hayden Coffin, Charles Hawtrey and others will appear. Mr. George Alexander and Company will present a special scene from one of the St. James's plays, Mr. Beerbohm Tree and Company will present a scene from "A Midsummer Night's Dream," and a Greek play will be performed by boys of the Westminster School. Misses Marie Tempest, Margaret Macintyre, Winifred Emery, Connie Ediss and Katie Seymour, and Messrs. Plunkett Greene, Charles Magrath, Cyril Maude, Huntley Wright, Edmund Payne, Lewis Waller, Herbert Campbell, and Fred Wright, jun., will contribute songs, dances, recitations, &c. The "Nellie Farren" Harlequinade and a bicycle lance ride will be given, and the *matinée* concluded by a military spectacle. Seats can be obtained from the hon. secretary, Theatre Royal, Drury Lane, at the following prices:—Boxes, from 10 to 100 guineas; stalls, 5 guineas; grand circle, 3 and 2 guineas; balcony, 15s. and 10s. 6d.; pit stalls, 3 guineas; first circle, 2 guineas and 1 guinea; and amphitheatre (unreserved), 5s.

The executive of the Building Trades' Gift to the Nation inform us that the building operations will now be immediately commenced, and the executive is putting itself into communication with the various donors as to the delivery of materials, &c. In order to facilitate delivery and save cartage a special siding has now been laid from Bisley Station right on to the site of the Homes, the necessary permission for this having been granted by the War Office and the National Rifle Association as adjoining owners. Hence all deliveries originally intended for Brookwood Station should now be made to Bisley Station.

The Birmingham School of Art has now 4,268 students.

The late M. Munkaczy, the famous Hungarian painter who recently died, planned his picture "Last Day of a Man Condemned to Death" at Dusseldorf. Against the advice of his artist friends he painted it and sent it to the Paris Salon of 1870; and it brought him at once a medal, a fortune, and a future. The painting by which he is best known in this country is his "Christ before Pilate," which was bought by Mr. Wanamaker, the well-known "dry-goods" storekeeper at Philadelphia, the price being said to be £20,000.

R.I.B.A.

ANNUAL GENERAL MEETING.

THE annual general meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being taken by Mr. William Emerson, the president.

The Annual Report

states that during the past year seventeen meetings of the Council have been held, exclusive of meetings held by committees. In the course of the year, 30 Fellows have been elected, 38 Associates, 1 Hon. Fellow, 1 Hon. Associate, and 1 Hon. Corr. Member. Of the 30 Fellows, 10 have been elected by the Council under the proviso to by-law 9, 4 being presidents of allied societies and 6 having been unanimously recommended by the councils of allied societies. The total number of subscribing members is 1,676. The following tabular statement, showing the growth of the Institute during the last fifty years, will be found of interest:—

Year.	Fellows.	Associates.	Contributing Visitors.	Hon. Associates.	Total.
1850	120	95	—	—	215
1860	173	139	12	—	324
1870	275	235	10	—	520
1880	346	335	—	115	796
1890	519	768	—	80	1367
1900	618	1013	—	45	1676

The only hon. corr. member elected is the Comte de Suzor, of St. Petersburg. Death has robbed the Institute of several members of high distinction—the Duke of Westminster and John Ruskin from the class of Honorary Fellows; William Simpson, whose ever ready help in Oriental questions is a great loss to the JOURNAL, from the class of Honorary Associates; Sir Arthur Blomfield and William White from the class of Fellows; and Paul Sédille, the famous French architect, who for many years had been an hon. corr. member of the Institute. The total losses by death during the past year are as follows:—*Fellows*: Charles Bell, Sir Arthur Blomfield, Thomas Elworthy, Benjamin Edmund Ferrey, Professor Banister Fletcher, Thomas James Flockton, William Kidner, Edward John Lowther, Thomas Cooke Nicholson, William Willmer Pocock, Richard Reynolds Rowe, Frederick William Stevens, William Wilkinson Wardell, William White, Stephen William Williams. *Retired Fellows*: Alexander Kendall Mackinnon, Francis Thomas Dollman. *Associates*: William James Anderson, Henry Hockey Burnell, Charles Henry Purday, James Hewitson Shaw, Ely Emlyn White. *Hon. Associate*: William Simpson. *Hon. Fellows*: The Duke of Westminster, John Ruskin. *Hon. Corr. Members*: Paul Sédille, J. von Egle, Michele Ruggiero.

The Examinations.

Preliminary and intermediate examinations were held in June and November, 1899, in London, Birmingham, Bristol, Cardiff, Dublin, Glasgow, Manchester, Newcastle (in June only), and York, and final examination in London. The results were as follows:—

Preliminary Examination: Exempted, 59; examined, 286; passed, 189; relegated, 97. *Intermediate Examination*: Examined, 119; passed, 63; relegated, 56. *Final and Special Examinations*: Examined, 84; passed, 37; relegated, 47.

It will be seen that during the year 248 gentlemen have been registered as probationers, the number of whom now stands at 1,283, and 63 as students, the number of whom now stands at 333. The Council takes this opportunity of drawing attention to the great increase in the number of candidates in 1899, the fees received amounting to £992 5s. as against £783 6s. received during 1898.

The Council greatly regret to say that the Arthur Cates prizes for the best sets of

testimonies of study (supplemented by certain specified sheets of drawings) submitted by students for admission to the final examination have not been awarded this year, no student who had passed the examination having observed the conditions.

The Council are in the midst of preparations for an architectural congress to be held in London during the week commencing June 18th next. The programme, as soon as it is completed, will be placed in the hands of members. It will include papers and discussions on architectural questions, visits to places of interests, the presentation of the Royal Gold Medal, a conversation at the Guildhall (by the kind permission of the Lord Mayor and Corporation), and the annual dinner. A General Committee of distinguished persons, architects and other artists, has been formed, which includes the names of Lord Windsor, Lord Strathcona, the Right Hon. A. Akers-Douglas, Sir W. B. Richmond, Sir L. Alma-Tadema, Mr. Basil Champneys, Mr. Walter Crane, &c. The Council have resolved upon a scheme for holding the

Special Examination in the Colonies,

and the first will be held in June, 1901, in Montreal and Sydney, simultaneously with that held in the United Kingdom. It will be open to all architects over the age of twenty-five. The examination will be conducted on precisely similar lines to those held at provincial centres—that is to say, the testimonies of study and the answers to papers will be adjudicated upon by the Board of Examiners sitting in London, and the oral alone will be conducted by the local committees. The Council have arranged that these local committees, appointed under the various local architectural societies, shall be in every way representative and responsible. As soon as South African affairs are cleared up, the examinations will be held in Cape Town and elsewhere. Adopting the report of a committee that had been in frequent communication with the Association of Technical Institutions, the Council have arranged that certain certificates of the Science and Art Department shall be accepted as exempting from portions of the preliminary and intermediate examinations. The facts are notified in the current Kalendar.

The Council have addressed a letter to the Secretary of State for the Colonies protesting against the proposed demolition of the old Curtain Wall at Famagusta, in the Island of Cyprus. A reply has been received from the Colonial Office stating that the letter has been referred to the High Commissioner of Cyprus. At the request of the Royal Commission of the Paris Exhibition, 1900, the president nominated three members of the Institute to act on the International Jury, of whom one, Mr. Thomas W. Cutler, has been selected. The Council, acting on behalf of the Institute, which was one of the seven original representative bodies concerned in the establishment of the Sanitary Inspectors' Examination Board, have advanced the sum of £30 towards the initial expenses of the Board. This sum will be regarded as a first claim on profits accruing to the Board in respect of fees for examination. Mr. Thomas W. Cutler has consented to act as the Institute's representative on the Board. The Council hope shortly to be in a position to submit to the general body a form of contract as agreed upon between them and the Institute of Builders, with whom they are still in communication. Attention has been given to various schemes for acquiring new premises for the Institute, but the Council are not yet in a position to make any report. Mr. Arthur Cates has been re-appointed as a member of the Tribunal of Appeal.

Since the present Council came into office the president has appointed twenty-one arbitrators under building contracts, and eleven assessors in the following public competitions:—Clacton-on-Sea Improvement, Corsham Hospital, Fulham Vestry Baths and Wash-houses, Abingdon School Board, Burnley Technical Schools, Bury Infectious Diseases Hospital, Newcastle School of Cookery, Dorking Hospital, Walsall Town Hall, Cameron Memorial Hospital (West

Hartlepool), Berkhamsted Girls' Grammar School Buildings.

The Associates' Disabilities.

During the past year a considerable body among the associates has approached the Council through chosen representatives in order to place before them certain disabilities that lay upon the class of associates, and to obtain, if possible, a larger share in the working of the Institute. The question of greater variation in the composition of the Council was also urged. The Council, after giving the matters the most earnest consideration, made a recommendation, now approved by the general body, that the by-laws should be so altered as to provide two extra associate seats on the Council, to remove the restrictions on associates' eligibility to serve on the Council, so that any associate may be eligible to serve, and, by abolishing the asterisks before the names of members of the existing Council on the voting lists, to secure an even chance of election for all nominees. The Council hope that, while convinced of the necessity of maintaining their dignity and prestige, they have acted in this matter in no illiberal spirit towards the younger members of the profession.

The financial prosperity of the Institute continues, the balance of receipts over expenditure being £1,125. The Council particularly desire to call the attention of members to the growing item of arrears of subscriptions; while they seek to exercise the powers given to them under the by-laws in a generous spirit, it would be a matter of great regret to them if the continued deficit in respect of subscriptions compelled them to take more stringent measures.

Report of the Literature Standing Committee.

Since the election of the present Committee, on June 12th, 1899, the Literature Committee have held eight meetings. At the first meeting Professor Elsey Smith and Mr. Arthur S. Flower were appointed hon. secretaries, and at the next meeting Mr. R. Phené Spiers was appointed chairman, and Mr. H. Heathcote Statham, vice-chairman. The Librarian having completed the catalogue of the loan library, by preparing a supplement carrying the work down to December 31st, 1899, the Committee have arranged that this supplemental catalogue shall be printed and bound up with the copies in stock of the original catalogue, and sold for 6d., as the "Catalogue of the Loan Library with Supplement comprising Additions to December, 1899." The Committee have also had under consideration the desirability of preparing a supplementary catalogue of the drawings, prints, and photographs in the library which are not included in the general catalogue. The Committee desire gratefully to announce the donation made to the Library by Mr. Aubrey Stewart, through Mr. Phené Spiers, of several books of drawings by the late Professor Willis and the Rev. Canon Stewart.

Report of the Practice Standing Committee.

The usual monthly meetings of the Committee have been held. Mr. J. Douglass Mathews was re-elected chairman, and Mr. S. Flint Clarkson was elected vice-chairman in the place of Mr. Thomas Harris, whose ill-health necessitated his retirement. Mr. J. Osborne Smith and Mr. C. H. Brodie were re-elected hon. secretaries. The consideration of the London Government Bill by the Committee resulted in a list of objections to, and suggestions for, the improvement of the Bill being sent to the Council, with a recommendation that they be communicated to the First Lord of the Treasury, the Clerk to the London County Council, the leading London newspapers, and the professional journals. The Council adopted the recommendation, and the suggestions, &c., were published in the Institute Journal for April 15, 1899, p. 349. The chairman of the Committee subsequently reported that he knew from conversation with members of Parliament and others that these suggestions carried considerable weight and were highly approved. The publishers of "Whitaker's

Almanac," acting on the unofficial communications of an hon. secretary of the Committee, have corrected and amplified their paragraph concerning architects' charges, so that it is now in accord with the revised Institute schedule. They also, for the first time, now publish, under the heading of "Professional Education," a list of the chief centres of architectural education and a reference to the Institute examinations. The Committee have, with the Council's approval, undertaken the consideration of the revision of the Institute pamphlet on "Dilapidations." This will probably involve the writing of an entirely new pamphlet, the synopsis for which is now under consideration. Any suggestions by members of the Institute will be welcomed by the Committee. The Committee have also in hand the preparation of a short schedule indicating the usual practice as to the payment and amount of fees in party-wall cases.

Report of the Science Standing Committee.

The Science Standing Committee report that they have held ten meetings since the publication of the last annual report. Mr. W. C. Street was appointed chairman; Mr. Lewis Angell, vice-chairman; and Mr. H. D. Searles-Wood and Mr. Max Clarke hon. secretaries. The Committee are preparing for publication the results of the experiments for ascertaining the strength of different kinds of brickwork, but they have not been able to complete the arrangement for acquiring a standard size for bricks, though they hope to be able to do so shortly. The Committee have undertaken an inquiry into the supporting power of rocks and soils, and hope to report the results in the course of next session.

After the foregoing report had been received and discussed, scrutineers were elected for the annual election of the Council and standing committees. Candidates were then nominated as auditors for the ensuing session, and the statutory board of examiners under the London Building Act were appointed.

Surveying and Sanitary Notes.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the Sanatorium, Bekesbourne, near Canterbury.

The South Wales and Monmouthshire Sanitary Inspectors' Association has been in existence two years, and has now a membership of 112 out of a possible 143, with forty-six honorary members, and twenty-three associates; making a total of 181.

A Big Paving Scheme.—In the City Hall, Dublin, on May 1st, Mr. O'Brien Smyth, Local Government Inspector, held an enquiry into an application of the Corporation for a loan of £28,198 for the purposes of stone and wood paving and asphalt in various streets of the city.

Leeds Street Improvements.—For widening Guildford Street, Leeds, it has been decided to purchase premises containing 170 sq. yds. for the sum of £7,225. Premises in Cookridge Street and St. Ann's Street containing 1,341 sq. yds., and premises in Great George Street containing 639 sq. yds., are also to be purchased by the City Council, the former for £13,000 and the latter for £4,473. This works out at £9 14s. and £7 per yard respectively.

Important Sewage Scheme for Chester.—A special meeting of Chester Town Council was held on Friday last to discuss the sewage outfall scheme recommended by the Sewering Committee, a scheme devised over twelve months ago by Major Tulloch, and estimated to cost about £36,000. Among other places, the system has been adopted with success at Chorley. After a lively discussion the recommendation was adopted.

The Proposed Westminster Improvement.—On Wednesday last a House of

Commons Select Committee began the consideration of the London County Council's Bill for extending the Thames Embankment from the Houses of Parliament to Lambeth Bridge, and for improvements at Westminster in connection with the scheme, at an estimated cost of £1,319,000.

Nuisance of Black Smoke.—At the Manchester City Police Court on May 2nd summonses were heard, taken at the instance of the Sanitary Department of the City Corporation, against a number of manufacturers and others for permitting black smoke to be emitted from the chimneys of their premises, and fines were imposed varying from £5 to 10s. and costs. In other cases orders of abatement were made.

Hull Sanitary Reform Scheme Rejected.—A special meeting of the Hull City Council has rejected (by a majority of one) the scheme which proposed to substitute water-closets for 36,109 privies in the city. Of the 56,861 houses in Hull 49,430 are what are known as privy houses, and of these 36,109 having no back-ways were described by the Sanitary Committee as "a danger to public health." The minutes which embodied this scheme also included recommendations for the sub-division of night-soil districts, and the collection of house and combustible shop refuse by the employees of the Corporation, instead of allowing it to be dealt with by the contractors.

Proposed Sewerage Works and Street Improvements at Sunderland.—A Local Government Board enquiry was held last week into the application of the Sunderland Corporation to borrow £16,106 for sewerage works and £3,060 for street improvements. The new Western Hill sewer, which is completed and cost £918, was included in the application, and provision was also made for a new main drain from Durham Road to the river, estimated to cost £10,000, and a new drain on the High Barns estate, the cost of which is put at £4,000. One of the street improvements contemplated is the widening of Deptford from 25ft. to a maximum of 30ft. The other is the Roker Baths Road, an old thoroughfare which was proposed to be widened from 25ft. to 45ft., as well as straightened.

A Glasgow Improvement.—Since electric cars commenced to run along the new route to Springburn it has become more than ever apparent that the accommodation in the narrowest and steepest part of the High Street is inadequate for the traffic, and it is satisfactory to learn that a widened street and a slightly easier gradient are forthwith to be secured. So soon as the premises on the west side of the street are vacated at the approaching term, the buildings are to be taken down, and a portion of the site is to be thrown into the street, which will then have a uniform width of 60ft. from Duke Street to Rotten Row. This particular section of the ancient thoroughfare has been more than once subjected to change. Originally the upper part must have been almost as precipitous as Balmano Street.

Ratable Value of Bradford.—The return of the ratable value for the city of Bradford up to the end of March has just been completed by the overseers, and shows a continued growth of the valuation. On March 25th of last year the ratable value of the unextended city was £1,192,226; and when the out-townships were added to the city on November 9th the ratable value became £1,368,103. The new ratable value of the old townships of the city is now £1,218,255, an increase of £26,029 on last year, and for the whole area now within the city boundaries £1,396,017, an increase of £27,914. The total ratable value for the townships recently added to the city is £177,762. The total amount of the rate for the new year has yet to be fixed, and it will to some extent depend upon the demands made by the various works which the Corporation propose to undertake. The City Fund rate, which includes the precepts for poor relief and School Board purposes, has been fixed by the overseers at 4s. 6d., which is 2d. more than last year.

Builders' Notes.

The death is announced of Mr. R. F. Dawson, of the firm of Messrs. R. F. Dawson and Son, contractors and stone sawyers, of Great Horton. Mr. Dawson was 53 years of age.

Fireproof Wood and Fire Prevention.—A striking instance of the escape of one of the "sky-scraping" buildings from fire in consequence of the use of non-flammable wood occurred recently in the big Dun Building on the north-east corner of Broadway and Reade Street, New York. A fire broke out sufficient to thoroughly ignite any ordinary building; but the Dun Building escaped because all the woodwork was rendered fireproof several years ago by the electric fireproofing process. This process is the same as that of the British Non-Flammable Wood Company, Limited.

New Doulton Institute.—Some years ago Sir Henry Doulton established close to his great Lambeth works a working men's club. Just before Sir Henry died, in November, 1897, he expressed the wish that a commodious and handsome institute might take the place of the humble little club. This wish has now been carried out, and in the new building in High Street, Lambeth, there are a lecture and concert room capable of holding 400 persons, billiard rooms, reading rooms and smoking rooms, all handsomely furnished and provided with the electric light. In a niche in the lecture room is a fine bust of the late Sir Henry Doulton, modelled by Mr. George Tinworth. A tablet shows that the institute has been erected to Sir Henry's memory by his children. Already 300 employees of the firm have enrolled themselves members of the institute.

Factory and Workshops Bill.—The Manufacturers' Section of the London Chamber of Commerce has issued to members of Parliament and to various Chambers of Commerce and Employers' Associations a report by its Parliamentary Committee on the provisions of this Bill. They point out that the Bill largely increases the discretionary powers of the Home Secretary in respect of so-called dangerous trades and in regard to overtime exemptions, and submit that such powers should, in the interests of employers generally, be a matter of statutory enactment rather than dependent on the individual view of the Home Secretary for the time being. The Section suggests various amendments in the Bill, and particularly in section 15, relating to measures for protection against fire in factories and workshops. While there is no objection to reasonable precautions being taken for the safety of workpeople, it is pointed out that to London manufacturers this section is the most serious in the Bill. Every factory erected since January 1st, 1892, and every workshop erected since January 1st, 1896, in which more than forty persons are employed, must be furnished with a certificate from the London County Council that reasonable provision has been made for escape in case of fire of all persons employed in storeys above the ground floor; or the building must not be occupied. With regard to every factory erected before 1892, and every workshop before 1896, it is the duty of the London County Council to ascertain that these are provided with reasonable means of escape, in case of fire, for all persons employed in storeys above the ground floor. "But there is this essential provision that, in case of difference between the occupier and the London County Council, the question may be referred to arbitration. There is no doubt that this provision has been a strong defence of London manufacturers from the action of the London County Council in requiring costly, and in many cases useless, alterations. The present Bill proposes to give the London County Council the same power for old as for new factories and workshops; in other words, the power to decide whether any factory or workshop may continue to be used or not, a power which no public authority ought to possess. The only protection manufacturers and owners would have is the existence of certain regulations issued by the Council, and they have no legal force."

Bricks and Mortar.

APHORISM FOR THE WEEK.

"The old south church, too, still pointed its antique spire into the darkness, and was lost between earth and heaven; and as I passed, its clock, which had warned so many generations how transitory was their lifetime, spoke heavily and slow the same unregarded moral to myself.—HAWTHORNE ("Twice Told Tales").

The "Trottoir Roulant." A great deal has been heard of late about the rolling pavement at the Paris Exhibition, so that a few particulars as to how it works will doubtless be interesting. It is not a detached structure like a railway train arriving at and passing certain points at stated times, but is always on the move, being nothing less than an "endless floor" about 2½ miles long. This pavement is raised 30ft. above the ground and there are ten entries to it, with as many exits, distributed along the Champ de Mars and the Invalides. You step on to it and get off when you like. There is, however, an important detail, which is, that the "trottoir" is divided longitudinally into three parts; the first of these is stationary, the second moves at the rate of about three miles an hour, and the third at about six miles an hour. When you are in a hurry you get on the third division, stepping on to the second when you desire to examine more leisurely something you are passing, and on to the first when you want to stop altogether. The novelty has been the cause of much fun, for even with this there is a right and a wrong way of getting on and off. Everyone knows what happens when a person alights from a 'bus with his face to the rear, and the same sort of thing occurs when a person does this on the rolling pavement.

Another Little Peculiarity. It is sometimes absurd to see, say, two men walking against the pavement (that is to say, moving their legs in walking fashion) and yet not making any progress. This is, of course, due to the pavement traveling in one direction as far as they are walking in the other, and is on the same principle as the racing horses that appeared at certain music halls some time ago, where they were running on an endless band driven at a high speed. From the foregoing particulars it will be seen that this means of locomotion is a very novel and pleasing one, and it is not surprising that it is so popular a feature of the great Exhibition.

Mr. Walter Crane's Report. THE Technical Education Board of the London County Council has made its annual award of art scholarships and exhibitions on the result of the recent competition. The examination of the work submitted was conducted by Mr. Walter Crane. There were ninety-seven candidates for the thirty School of Art scholarships, 172 for the thirty Artisan Art scholarships, and 214 for the 100 Junior Artisan Evening Art exhibitions. The scholarships are of the value of £20 and £10 a year, together with free tuition, and they are given for periods of two and three years. Mr. Walter Crane, in his report, states that there was a large increase in the number of works sent in, and they were generally of improved quality, and of a more practical character than those executed in 1898. He naturally noted certain imitative tendencies in design, and the constant recurrence of certain types of form in ornament, such as "the ogee-shaped formal tree upon the elongated stem" frequently offered on designs for book covers from art school, or "the well-known tree with the wriggling roots or the squirming curves tying themselves in knots or ending in heavy masses," which saved the trouble of digging deeper or going further afield for fresher decorative forms. As he had noticed before, the

sets of drawings sent in from art schools did not appear to be considered complete without a design for a poster, and these generally showed more determination to strike one by means of raw contrasts of colour or eccentric form than by really decorative or mural feeling or good drawing. Mr. Crane adds on this point that, while the poster affords the only opportunity or outlet for popular mural design, it is doubtful whether, owing to the essential conditions of the hoarding, this is not crushed by the very efforts of designer and printer to appal the eye rather than appeal to it. "The best correction, perhaps, would be a course of training in the arrangement and design of plain bills of lettering, which are quite capable of being made dignified and ornamental in effect when kept quite severe in form." In this connection he notes with pleasure the establishment of a class for the study of lettering, writing, and illumination at the Central School of Arts and Crafts. In the metalwork there were some extremely well-made articles, but as a rule the execution was better than the designs, which suggested that the study of better models would be desirable. The enamels generally showed more feeling. Mr. Crane praised the wood-carving exhibits and the designs for simple furniture.

Art in the Street. A correspondent writes to the "St. James's Gazette" as follows:—"The County Council has at last asserted its influence in the art interests of our public thoroughfares. It has invoked the aid of architects, in select competition, in order that by such precautions the new street which is to debouch on the Strand may not be ruined by the art abortions which now too commonly disgrace the street architecture of the metropolis. So far this is well, and, let us hope, of good augury. But if only the County Council had been less tardy in its action in such direction we might have been spared the disfigurement of Regent Street recently accomplished by two coarsely designed, discordant buildings—one on each side of the way between Oxford Street and Piccadilly. If, too, the Council had exercised due control, under expert advice, over the design of public art works in metal, we should not be threatened, as we are, by the ill-designed and clumsily-modelled 'Boadicea' group in bronze which is to afflict the public at the west end of Westminster Bridge. As regards the electric-light standards which are now being placed in Trafalgar Square, no words of ridicule or contempt can describe the depth of degradation to which art work has fallen in these disgraceful productions. Why, it may be asked, has not the County Council saved us from what is nothing less than national humiliation in the eyes of our foreign visitors? These will not fail to remember how in Paris, for instance, such works are of remarkable beauty, in proportion and artistic refinement of detail, on which an artist of high ability has not failed to leave his mark and win a reputation. Further, may we not wonder how it is that our costly teaching institution at South Kensington, with its branches throughout the provinces, has not made such an infliction as that in question beyond the range of possibility?"

Paris Disaster: The Prefect's Report.

In the official report which he sent to M. Waldeck-Rousseau relative to the bridge collapse at the Paris Exhibition, the Prefect of the Seine states that about two years ago, on receipt of an application from M. Gáleron for permission to construct the bridge, he referred the matter to the Municipal Council. The affair dragged on, and in February, although no decision had yet been arrived at, M. Gáleron began the work. As there was practically no doubt that permission would be eventually forthcoming, the Prefecture of the Seine did not offer any opposition, and on April 9th the Municipal Council sanctioned the erection of the "Passerelle." "It was," the report continues, "a matter of the utmost importance that the props and scaffolding should not be removed until the ordinary precautions against any accident had been adopted, and that the public

should not be admitted to the bridge until it had been subjected, like all work of the same kind, to the regulation trial." The report concludes: "But it happened that, contrary to all possible supposition, on Sunday, in the absence of the agents of the City of Paris, and without having informed anyone of his intentions, the person who had obtained the concession proceeded to the partial removal of the supports of his construction, which was immediately followed by the fall of the bridge." All responsibility for this sad accident is therefore thrown in this report on M. Gáleron.

The Forum Discoveries. PARTICULARS have been given in these columns from time to time of the progress of the excavations in the Forum at Rome. These excavations had at first to be carried out in an almost clandestine manner owing to the lack of funds and the jealousy of influential archaeologists, but they gradually assumed such importance as to render futile all attempts at opposition, and Signor Boni (who has just been created Knight Commander of the Order of the Crown of Italy by King Humbert for his services) now believes himself to be on the eve of a discovery quite as important for the topography of the Forum as his former discovery of the real position and character of the Sacred Way. The workmen have recently been carrying out a minute examination of the structure of the Cloaca Maxima, or the huge main sewer of ancient Rome, which has hitherto been believed to date from the time of Tarquin. This examination has confirmed previous ideas as to the excellence of the structure, but has shown many of the materials employed to have belonged originally to buildings of the early Republican epoch. This has led Signor Boni to conclude that, far from dating from the time of Tarquin, the Cloaca Maxima, as hitherto known, must have been constructed during the later Republican period. The problem is now to find out whether this Republican sewer is, or is not, the original one, or whether there does not exist at a different level and running in a different direction another original Cloaca Massima of the Regal epoch, the existence of which archaeologists have never yet suspected. Signor Boni is said to believe that a little accurate excavation will bring him on the traces of this most ancient sewer, the discovery of which would not only be of great archaeological interest in itself, but would help to determine the original topography and the real level of the ancient Forum. Meanwhile, underneath the modern Church of Santa Maria Liberatrice, which the Italian Government recently expropriated and demolished, have been found traces of the old staircase which formerly united the Forum to the Palatine Hill. Before long the material and earth will have been completely cleared away, and visitors will be able to pass up and down the very stairway which the ancient Romans used as a means of communication between the one famous site and the other.

Blackfriars Monastery. A PORTION of the walls of the old Blackfriars Monastery have recently been discovered in course of some "house-breaking" work in Ireland Yard, St. Andrew's Hill, between Ludgate Hill and Queen Victoria Street. When the housebreakers commenced their work on the ground floor of the house recently occupied by Messrs. Lidstone and Son they had to remove some deal panelling which had been affixed to the walls. On clearing away the boarding from one of the walls a Norman doorway of the old monastery was discovered with part of the wall into which it was sunk. This doorway and the wall itself were at once laid bare. It was bricked up many years ago—no doubt when the house was first built, for the bricks are still firmly embedded in what was once the aperture. It cannot yet be ascertained what will be done with this interesting relic, but in all probability it will be demolished with the rest of the building, as it seems to be too awkwardly placed for convenient preservation.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Sewage Settling Tanks.

CLITHEROE. — CONSTANT READER writes: "Enclosed you will find a plan and section (not reproduced) of two settling tanks for sewage. The division wall is 2ft. 3in. thick, of brick or concrete. What will be the pressure against this division wall when one tank is empty and the other is full? What pressure will a wall of that thickness stand? Would an 18in. wall be strong enough? Which is the best book to read on such matters?"

The plan and section of the two settling tanks show a division wall 50ft. long, 2ft. 3in. thick, and 5ft. 6in. high, whilst the maximum depth of water is 5ft. The pressure of water acting against the division wall under the conditions mentioned is equivalent to the weight of water contained within a right-angled triangle having a height and base of the same length as the total depth of water.

Total water pressure on wall

$$\begin{aligned} &= 50' \times 5' \times 5' \times 62.5 \text{ lbs.} \\ &= 39,062.5 \text{ lbs.} \\ &= 348 \frac{1}{2} \text{ cwt.} \end{aligned}$$

To ascertain the stability of the retaining wall, a portion of the wall, 1ft. in length, is taken as a convenient unit for the purposes of the calculation. The pressure of water acting on this unit is contained within a right-angled triangle, having a height and base of the same length as the depth of the water, and 1ft. thick. The resultant of this water pressure is represented by a single force acting horizontally at a distance of one-third the depth of water from the bottom of the tank. The moment of pressure of the water acting on the unit of wall at its base may be determined by multiplying the weight of water contained within a triangle 5ft. high, with 5ft. base and 1ft. thick, by one-third the depth (1ft. 8in.) of water. Similarly, the resultant of the pressure of the retaining wall is represented by a single force acting vertically downwards at the centre of the wall, whilst the moment of pressure of the unit of wall is found by multiplying the weight of the cubic contents of the brickwork contained within a foot of its length by half the thickness of the wall. Let w = weight of water per foot cube = 62.5lbs. per foot cube; b = weight of brickwork per foot cube = 114lbs. per foot cube; h = height of wall in feet = 5.5ft.; d = depth of water in feet = 5ft.; x = thickness of wall in feet.

The equation for simple stability (exclusive of the co-efficient for friction or cohesive power of the cementing material) is as follows:—

$$\begin{aligned} h \times x \times x \times b \times \frac{x}{2} &= d \times \frac{d}{2} \times w \times \frac{d}{3} \\ \frac{h b x^3}{2} &= \frac{w d^3}{6} \\ x^3 &= \frac{w d^3}{3 h b} \\ x^3 &= \frac{62.5 \times 5^3}{3 \times 114 \times 5.5} \\ x^3 &= 4.15 \\ x &= 2.04 \text{ ft., or } 2 \text{ ft. } \frac{1}{2} \text{ in. nearly.} \end{aligned}$$

From the foregoing it will be seen that a wall 2ft. ½ in. thick is required for simple stability. A brick wall, 18in. thick, is therefore inadequate, but a brick wall 2ft. 3in. thick will be quite suitable for the purpose. The cohesive strength of the cementing material used in the construction of the wall (which varies according to the nature of the mortar or cement used) has been omitted for the sake of simplicity and clearness, and also because in ordinary practice any additional strength thus obtained may be considered as providing a reasonable margin of safety.

The graphic method of ascertaining the stability or otherwise of any given retaining wall is shown in the accompanying diagram. The resultant of the pressure of water is represented

DIVISION WALL FOR SEWAGE SETTLING TANK.

by the line A P, acting horizontally at one-third its height from the bottom of the tank, whilst B P is the resultant of the pressure of the wall acting vertically downwards at the centre of the wall. The total pressures of the water and of the wall are now laid down to scale, and indicated by the lines P C and P D respectively. The parallelogram is completed, and the diagonal P E represents the resultant of the two pressures. In the case of the 2' 3" wall here shown, it will be observed that the resultant of the two pressures intersects the base line of the wall well within its thickness, and the necessary stability is thereby ensured. For a complete text book on the subject, "Rankine's Manual of Civil Engineering" (published by Messrs. Griffin and Co.) is recommended.

T. E. C.

Preventing Tracing Cloth Wrinkling.

CARDIFF. — W. H. L. writes: "I find, after applying colour to tracing cloth, that it wrinkles and becomes useless. What preparation is necessary to prevent this? I have used prepared liquid ox-gall both in the ink and in the colour."

There is nothing that can be mixed with the colour to prevent the wrinkling of the tracing cloth when it is applied. The remedy is to pin the cloth down with, say, four pins on every side, care having been taken the cloth is very tightly stretched. It should be so left until quite dry, when the surface will be found to be comparatively even.

H. F. W.

Architects' Final Certificates.

CARDIFF. — OMEGA writes: "What is the usual practice with architects when granting their final certificate for work done under a contract which states that the work should be finished at a certain time under a penalty, and the work is not completed in the stated time? Is it proper for the architect to advise the proprietor as to the amount of the penalty, and ask him whether he wishes to enforce it, or to grant his final certificate, deducting from it the amount of the penalty without consulting the proprietor?"

We are not aware that there is any established practice on the subject. The architect should give a certificate in accordance with whatever may be his duty as defined by the building contract. If the contract empowers him to determine whether penalties are or are not recoverable, and he finally certifies that money is due to the builder without taking into account any penalties that the latter has incurred, he thereby determines that penalties have not been incurred, unless it has been agreed that he shall not exercise the power. If the contract confers the power, the architect ought to exercise it, leaving to his client the question whether he will insist on his strict rights or not. If the contract does not confer the power, he may omit all reference to penalties in his final certificate, or, if he thinks that penalties have been incurred, insert in his certificate such reference to the matter as will show that in ascertaining the amount certified for he did not deal with the question of penalties at all.

H. P. B.

Ordained Surveyors.

DUNDEE. — SURVEYOR writes: "(1) What is an 'Ordained Surveyor,' and how is the title obtained? (2) What is necessary in order to become a member of the Surveyors' Institute? (3) Is there any work published dealing with the Continental co-ordinate system of surveying, as employed, for instance, in the Transvaal? If so, what is the cost, and who is the publisher?"

(1) So far as we are aware, there is no such thing as an ordained surveyor. Possibly it may be a local Scotch term; or possibly a surveyor engaged upon the Ordnance Survey may be meant. If any reader could assist us with a more correct answer we should be glad to hear from him. (2) The Surveyors' Institute can only be entered after passing a series of examinations, the particulars of which can be obtained from the Secretary, Great George Street, Westminster, S.W. (3) The co-ordinate system is that known as "traversing" in England. Full descriptions will be found in "Surveying and Surveying Instruments," by G. A. T. Middleton (Whitaker and Co., 4s. 6d.). G. A. T. M.

Strength of Bressummer.

YORKSHIRE writes: "In a building there is a beam formed of three 9in. by 3in. pieces bolted together, spanning a 9ft. opening over a bay window, with 14in. brick wall and gable over. This beam has sagged ¾ in. to 1 in. in the middle. Will it go any further, or is it necessary to strengthen it, and how?"

Three 3in. by 9in. deals bolted together are sufficient for supporting a 14in. wall over not more than 8ft. span, or a 9in. wall over 12ft. span. If the bressummer carries the floor joists also, a further reduction of span by one-fourth is desirable. If the two inner deals can be shored up the outer one may be removed for the insertion of a 3in. fitch plate and replaced.

HENRY ADAMS.

Hammer-Headed Key Joint.

DUDLEY. — AYAT JAY writes: "I should feel obliged if you could give me a sketch of a hammer-headed key joint. This has been asked for several times in the South Kensington examination in Advanced Building Con-

HAMMER HEADED KEY JOINT.

struction, but I cannot find it in any of my handbooks."

The hammer-headed key joint is used in church doors with curved heads to connect the stiles with the head rails, as shown in the accompanying illustration.

HENRY ADAMS.

Builders' Book-keeping.

WEST HARTLEPOOL. — E. W. K. writes: "What is the address of Mr. Saker, the author of 'Builders' Book-keeping: a Perfected System'; also, is there any good book on keeping prime cost of contract work?"

Mr. Saker's address is 95-97, Finsbury Pavement, E.C. Other books on book-keeping do not give any information as to keeping prime cost of contract work.

Shipper Bricks.

DUDLEY.—AYAT JAY writes: "I should be glad to have a description of a 'Shipper' brick."

The names given to different classes of bricks vary in different districts, and even in different brickfields of the same district. According to Vol. III. of Notes in Building Construction the classes are sub-divided into malms, washed bricks, and common bricks, according to the manner in which the earth has been prepared, and are further sorted into varieties according as they have been affected by the fire in burning. "Shippers" occur in each class, being below the medium in malms, about the medium in washed bricks, and the highest quality in common bricks. They may be described as sound, hard-burned bricks, not quite perfect in form, and chiefly exported.

HENRY ADAMS.

Land Ownership.

TENANT writes: "Who would you say was the owner of the mound shown in the accompanying illustration? A has the ditch or trench on his ground, and claims to the centre of the mound. B, whose ground is on a higher level, claims all the mound, and wants provision for his surface water to run in A's

who protest and wish to prevent the closing of the road?"

(1) The road is now a public road. We cannot say definitely whether it is repairable by the local authority, but the fact of their having repaired it on several occasions is evidence that it is repairable by them. (2) It is the duty of the district council to protect the public right of way, and to prevent, as far as possible, its being stopped or obstructed, where the stoppage or obstruction would, in their opinion, be prejudicial to the interests of their district (Local Government Act, 1894, 56 & 57 Vic., chap. 73, sect. 26, sub-sect. 1). This provision applies to rural as well as to urban districts. The district council may adopt any of the following courses:—(a) Direct the removal of the obstruction. (b) Indict the person who caused it. (c) Proceed by action in the name and under the fiat of the Attorney-General. (d) Remove the obstruction and recover the expenses of doing so against the obstructor (see as to this last remedy *Louth District Council v. West* (1896), 65 L.J., Q.B. 535; 60 J.P. 600). Such being the duty and the rights of the district council, the remedy, if they disregard their obligation, is provided by the fourth sub-section of the above section, which enacts that where a parish council, or, where there is no parish council, a parish

Correspondence.**Sun Prints.**

To the Editor of THE BUILDERS' JOURNAL.
LONDON, W.C.

SIR,—Your correspondent "Ipswich" (see page 233 of last week's issue) need not make inked-in drawings transparent if he likes to copy them by the Sepia process, as by this process sun-copies can be taken direct from drawings on thin Whatman or Bristol board; but the lines should be inked in very clearly, and with a perfectly black ink.—Yours faithfully,
THE LONDON DRAWING AND TRACING OFFICE.

Measuring Mouldings.

To the Editor of THE BUILDERS' JOURNAL.
HEREFORD.

SIR,—I thank you for your answer to my inquiry with reference to the method of measuring mouldings, which appeared in your issue for March 28th last. I have tried the method advised, namely, by means of lead strip, but I cannot say it is satisfactory, as the least move would alter the line of mouldings, and if it be a cap with many moulds it is impossible to work the lead to them. I think there must be better methods than this one, and some good way of measuring elaborate mouldings, and I shall be glad if you will insert this letter, in the hope of obtaining the views of other readers on the subject.—Yours truly,
H. S.

Masters and Men.

The Selby Bricklayers' Wages have been advanced 1d. per hour on the old rate of 8d.

The Pudsey Carpenters and Joiners have struck for an advance from 7d. to 8d. per hour.

The Swansea Builders' Labourers have struck for an advance in wages from 5½d. to 6d. per hour.

The Plasterers in the Bangor District have been granted an advance of wages from 7d. to 8d. per hour.

The Dundee Slaters have struck against the masters proposed reduction of wages from 9d. to 8½d. per hour.

The Operative Plumbers at Paisley have struck for an advance of ½d. per hour on the present wage of 9d.

The Plumbers at the Leicester Isolation Hospital Works who struck work recently have returned to work.

The Stonemasons in New Mills, chiefly "banker hands," have struck for an advance of from 8d. to 9½d. per hour.

The Operative Masons in Bradford have been granted an increase of ¾d. per hour, making their wages 9½d., on May 1st.

The Northwich Painters have been granted an increase of ½d. per hour in wages, with the promise of another ½d. next year.

A Strike of Bricklayers' Labourers at Lincoln has occurred, 1d. an hour advance being demanded on the present rate of 5d.

The Barry Carpenters and Joiners, numbering between thirty and forty, have struck for an advance of ¼d. in November and ¼d. next May.

The Carpenters at Dover are on strike for an advance of ¾d. per hour on their wage of 8d., and to finish work at 12 on Saturdays instead of 1 o'clock.

The Dudley Carpenters' Strike has been settled by the employers agreeing to give the advance from 8d. to 8½d. per hour in July next.

The Master Painters in Bingley and District have decided to form themselves into an association for the conduct of the trade. Mr. Charles Dawson, Bingley, is president, Mr. A. Anderson, secretary, and Mr. W. Stoney, treasurer.

trench. A has let 146ft., or thereabouts (in lease), at £16 18s. per year to C. The 146ft. comes to the centre of the mound, but this belongs to B, and if provision has to be made for his surface water (leaving the trench open) C will only have about 140ft. of ground. Would 140ft. be the 'thereabouts' referred to in the grant instead of 146ft.?"

The presumption is that the person on whose land the mound is owns not only the ground covered by the mound but the ground occupied by the trench, because a party inclosing his own land makes his ditch or trench upon the extremity of his own ground, and throws up a bank on his own side out of the excavated contents of the ditch; so that the land constituting the ditch or trench, though on the outside of the bank, forms in point of law part of the inclosure. The presumption of ownership arising from the existence of the trench and bank may, of course, be rebutted by evidence that the land covered by the bank or occupied by the trench belongs wholly or partly to the adjoining owner. Unless such rebutting evidence exists, B in the case referred to by our correspondent owns the ground up to the surface line of the trench on A's side. We do not think that a measurement of "146ft. or thereabouts" would be satisfied by a measurement of 140ft.
H. P. B.

Company's Right to Close a Road.

WALLSEND-ON-TYNE.—ESSEX writes: "About sixty years ago a coal company rented a piece of ground about 500yds. long, and since that time it has been continually used, the higher level as a wagon-way and the lower as a road. The road has never been closed, and the public have had free access, it being now the principal means of communication between two villages, and on several occasions it has been repaired by the local authority. The coal company now propose discontinuing the railway and closing the road. The local authority, the members of which are mostly connected with the colliery, refuse to take action in the matter. (1) Is the road now a public road, repairable by the local authority? (2) What is the mode of procedure by public at large

meeting (sect. 19, sub-sect. 8), have represented to the district council that any public right of way has been unlawfully stopped or obstructed, it shall be the duty of the district council, unless satisfied that the allegations of such representative are incorrect, to take proper proceedings accordingly; and, if they refuse or fail to do so, the parish council, or meeting, may petition the county council; and, if the latter so resolve, the powers and duties of the district council in this respect shall be transferred to the county council. The remedy, therefore, is for the parish council, or, should there be none, a parish meeting, to make to the district council a representation that the road has been unlawfully stopped or obstructed, followed, after a reasonable time, by a petition to the county council. We assume that the lease to the coal company has not expired. If it has, the landlord may not be bound by the dedication of the road to the public by the company, though possibly he may.
H. P. B.

Strangers' Hall, Norwich.—In the course of a recent lecture on this building before the Norfolk and Norwich Archaeological Society, Mr. L. G. Bolingbroke said that Strangers' Hall was never a portion of any ecclesiastical building, nor an annex for guests from the neighbouring palace of the Dukes of Norfolk, and was never occupied by any representative body of the Strangers or by the Guild of St. George. Beneath the west end of the hall itself, and running transversely with it, is a fine decorated crypt of three bays, on the east side of which is a passage way leading to the garden on the south side of the hall, while to the east of this passage are other cellars. These cellars (which are so frequently found throughout the city beneath more modern work) are the crypts for the storage of valuables which usually existed beneath the timber-built houses of the fourteenth century. As the houses above them decayed and were removed, more substantial buildings were erected over them, and this is the case in the present instance.

The Grimsby Painters' wages have been increased from 7d. to 7½d. per hour.

The Newcastle Builders' Labourers, to the number of about 300, have struck for an advance in wages from 6d. to 7d. per hour, and also to revise the rule relating to carrying stones up ladders and to alter the system of allowing apprentices attending as bricklayers working as labourers.

Aberdeen Joiners' Dispute.—Ex-Lord Provost Mearns, who was appointed to decide between Mr. E. G. Wilson and Treasurer Bisset, the arbitrators who were unable to agree, has come to the conclusion that the rate of wages of the workmen should be reduced from 8½d. to 8d.

The Carpenters and Joiners at Belfast have struck for a week of 52½ working hours, stopping at 12 o'clock on Saturday; a ½d. an hour rise, making 9d.; and an increase of one shilling on the present allowance of one shilling a week per mile outside the boundary lines up to three miles. The main point of difference, however, is the carpenters' claim that they should do the work of pointing and ringing of piles, the making of concrete boxes, and all the carpentry work connected with concrete walls and floors, as well as with engineering and jetty work, which the masters claim as unskilled labour.

Advance to Cardiff Painters.—Some months ago the members of the Cardiff branches of the Amalgamated Society of House Decorators and Painters gave notice of their intention to ask for an advance of one penny per hour in wages. An increase of a halfpenny per hour has now been accepted. Certain alterations in the working rules have also been satisfactorily arranged.

National Conciliation Board.—At a Meeting of the Council of the National Association of Master Builders of Great Britain and Ireland held in St. Martin's Town Hall, on Thursday, April 26th, the president, Mr. W. Sapcote, being in the chair, the correspondence which had taken place between the secretary, Mr. J. A. S. Hassal, and the operatives' representative, Mr. G. B. Cherry, relative to the proposed formation of a National Conciliation Board was read. After discussion the following resolution was adopted:—"That having heard read the correspondence which has passed between this Association and the operatives on the subject of the suggested formation of a National Conciliation Board the Council desires to confirm the resolution passed at a Council Meeting of this Association held on October 24th, 1899, as follows:—"That in the opinion of this Council it is not expedient to proceed with the formation of a National Conciliation Board at present, unless a monetary guarantee be given on both sides for the due performance of the decision of the Conciliation Board."

Disputes in the Potteries.—Sir John Taylor, acting as arbitrator in a dispute between the Potteries, Newcastle and Leek branch of the Master Builders' Association and the Operative Carpenters and Joiners of the Newcastle and Potteries district, has decided that the present rate of wages shall remain unchanged, that rate having been arranged only last year. The award provides for a small alteration in the working hours on Mondays and Saturdays during the eight months mentioned. The award has been accepted by the parties concerned, who have agreed that it shall continue in operation for three years from May 1st. The operatives had given notice for an increase of wages from 8½d. to 9d. per hour, and for a reduction of 3½ hours per week during the eight months from March 1st to October 31st; and the employers had given counter notices for a reduction of wages from 8½d. to 8d. per hour, and for a reduction of one hour per week during the period mentioned. Following immediately upon this amicable settlement, there has commenced a serious dispute in another branch of the building trade of the district. The bricklayers, to the number of between 400 and 500, have come out on strike to enforce their demand for an increase of wages from 8½d. to 9d. per hour.

Engineering Notes.

Athlone Workhouse is to be steam heated by Messrs. John King, Ltd., engineers, of Liverpool and Donabate.

Birmingham Tramways.—The Birmingham City Council decided at its last meeting to accept the proposals of the City of Birmingham Tramways Company for the equipment of the Bristol Road tramways on the overhead electric system.

London's Electric Railways.—Having heard evidence and arguments of counsel on the Bill for extending the authorised Baker Street and Waterloo Railway to Paddington at the one end and to the City and South London Railway near the Elephant and Castle at the other, the Committee of the House of Commons on Thursday last found the preamble proved.

Institution of Gas Engineers and the Gas Institute.—It is proposed to amalgamate these two institutions, and at a meeting of the former held at Westminster on May 1st the proposal was approved. The president, Mr. J. W. Helps, of Croydon, remarked that no one interested in the gas industry could fail to come to the conclusion that two institutions, each claiming to represent the gas profession, were unwarranted, and were likely to interfere with the success and prosperity of the industry.

Large Tramway Scheme Sanctioned.—On Thursday last a Committee of the House of Commons passed the preamble of a Bill for the incorporation of a company with a capital of about a million with authority to construct a network of tramways in South Lancashire, to be worked by electric traction, in the large area between Manchester or Salford on the east to St. Helens on the west, with connections with those places. Forty-five separate tramways are to be made.

City Corporation Electric Lighting: Important Judgment.—On Thursday last Mr. Justice Farwell gave judgment in the Chancery Division in the action of the *City of London Electric Lighting Co. Limited v. Lord Mayor & Co. of London*. It was brought by the plaintiffs to obtain a declaration that certain contracts made by them with the Corporation for the lighting of the City were valid. Defendants contended that the contracts were void, by reason of the fact that members of the Corporation were shareholders in the plaintiffs' company, which was prohibited by the Acts of 1848 and 1851.—His Lordship construed the contracts in favour of the plaintiffs, and granted the declaration asked by the plaintiffs, ordering the defendants to pay the costs of the action.

A Great Bridge.—The contract for the new steel bridge over the St. Lawrence River at Quebec has just been awarded to the Phoenix Bridge Company, Phoenixville, Pennsylvania. The contract approximates to £900,000. The bridge, which requires 27,000 tons of steel, will be 4,000ft. long and 150ft. above the river. It will consist of three spans, two of 600ft. each and a centre span of 1,800ft. This middle span will be the longest cantilever span in the world, surpassing the Tay bridge's great span by several hundred feet. The bridge is to be 76ft. wide, with a roadway, four railway tracks, and footways on each side. It is to be finished in three years, and the work will be begun immediately.

Street Lighting by Gas.—Among the towns which have recently made large extensions in the use of the Welsbach incandescent system for street lighting are Bradford and Huddersfield, both of which have municipal electricity and gas supplies. Bradford introduced the Welsbach system with success some time ago, and has now decided to fix several thousand more burners. In Tunbridge Wells, where the Corporation also owns the electric light, the Town Council has decided to fit 350 incandescent burners in street lamps. The gas undertaking in this case is the property of a company. The sea front at Hove, which gives excellent opportunities for good lighting, is at present being fitted with new lanterns and burners for the Welsbach system. Other

towns which have recently adopted this method of street lighting include Dukinfield, Maidenhead, and Hemel Hempstead.

Birmingham's Welsh Water Scheme.—Birmingham is beginning to see a great deal of its Welsh water scheme. Between Frankley and Northfield Station great pipes are being hauled continually. From the higher parts of the road may be seen a long line of these pipes across the fields, rising and falling over hill and dale, and looking, with their tar-coating glistening in the sun, like the folds of some fabulous serpent. This line brings one to the great service reservoir near Frankley Beeches. The storage is two hundred million gallons, which, at the rate of thirty gallons per head per day, would, without renewal, serve for about ten days the population in and around Birmingham dependent on the scheme. Semi-circular in plan, and divided into two by a wall forming a sagitta of the arc, the reservoir has a water surface of twenty-five acres and a depth of 31½ft. when bank full. Roughly, the reservoir is about 650ft. above the level of Birmingham, but though it will give a higher average pressure than is now possible it will not serve the higher parts of the city and suburbs. Water, therefore, will be pumped from it to still higher reservoirs at Warley. The work is going on to the satisfaction of the engineers, who have no doubt of being ready within the Parliamentary time limit. The larger portion of the main walls has been erected, and a considerable portion of the blue brick and asphalt lining is ready. The filter beds are well in hand, and several of them are about half completed. The pipes now being got into the ground are for the 3ft. 6in. main to Birmingham. At first the inlet to the reservoir will consist of two cast-iron mains of this size, but ultimately there will be six, and all permanent works are constructed with this view. The six pipes would bring the water from Wales at the rate of a hundred million gallons a day, filling the reservoir in two days instead of in six. At present about 450 men are employed on the works, the supply of labour having been lately drawn upon for other works in the vicinity, such as the Hollymoor Asylum and the pipe-laying contract. The latter has been given to Messrs. John Aird and Son, while the contractor for the reservoir is Mr. J. Kellett. The resident engineer is Mr. F. W. Macaulay.

New Patents.

These patents are open to opposition until June 11th.

1899.—Public Baths.—7,992. J. KANE, Bristol. In a public bathing establishment arranged according to this invention the baths are divided off from the dressing rooms in the following manner:—Assuming an oblong building, an entrance corridor will extend on three sides, and will give access to the dressing rooms, these extending the length of the building and enclosing the baths between in a kind of hall. By this means the temperature of the bath room and of the dressing room can be regulated to suit their respective requirements.

Slabs for Railway Platforms, &c.—9,375. E. BRAEDNER, Manchester. This is an improvement on patent No. 6,190 of 1895, and consists in making the edge of the slab of small tiles of ironstone, afterwards adding the concrete backing. The tiles can also be fixed to the edges of slabs (wood or stone) *in situ*. They consist of the usual foundation of ball clay mixed with sands, to which powdered ironstone is added to give density and strength, the necessary whiteness being obtained by mixture with a sufficient quantity of china clay and flint.

Mortising Machines.—10,531. W. L. WISE, London, W.C. (J. D. Wood, Milwaukee, U.S.A.) The machine dealt with by this invention is intended to be worked by hand, and consists of an upright frame supporting mechanism which operates an auger and four

chisels that work in unison for cutting rectangular holes.

Hardening and Fireproofing Wood.—10,618. S. WILLNER, London, E.C. The wood is first placed in a chamber and heated till all the moisture is driven off. The chamber is then sealed, and a vacuum formed within it, after which a boiling solution of fifteen parts of tungstate of soda and ten parts of white gelatine, diluted with water, is sprayed into the fibres of the wood. The vacuum is then broken, and the superfluous liquid taken off. Then the vacuum is re-made for the spraying of a solution of formic aldehyde. Pressure is maintained for several hours, and the wood is then dried slowly.

"Slag Wool."—11,544. A. D. ELBERS, Hoboken, Hudson, U.S.A. "Slag wool" made according to this invention is freer from sulphur than the ordinary article, and is, therefore, claimed to be of better quality. The blast-furnace slag is desulphurised by smelting it in a cupola-furnace in admixture with gypsum, or other sulphates of the alkaline earths, and is afterwards blown into mineral wool.

Firegrates.—11,840. E. M. TURNER, London, S.E. The bottom bars of the firegrate (or some of them) are made hollow and open at both ends, the front ends being covered by a damper for regulating the draught. These bars are in combination with a hollow back, so that the air can pass through them into the back of the fire and so make it burn more brightly. At the top of the hollow back an air deflector is fixed, and provision is made for the escape of heated air into the room from a grid in the upper portion of the grate.

Acetylene Gas Generators.—12,053. THORN AND HODDLE, London, S.W. The object of this invention (which has particular reference to patent No. 15,962 of 1096) is to provide means for precluding the risk of an explosion by a certain mixture of acetylene and air, when the apparatus is first started. The air space in the holder is reduced by a diaphragm that forms an upper chamber into which water or any material can be placed to regulate the gas pressure. Provision is made to prevent the holder becoming over-charged or having too much pressure.

The following specifications were published on Saturday last, and are open to opposition until June 19th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—7,460, ROBERTSON, articles of furniture. 7,797, LORENZ, construction of building materials and mode of connecting them together. 8,376, HASLETT, metal window frames and sashes. 9,893, WHITAKER, apparatus for excavating. 10,045, CORDON, glazing of roofs and other structures. 10,494, RAMSDEN, bacterial treatment of sewage. 10,542, GIBARD, turning lathes. 11,084, ADAM, brick and tile-making machinery. 11,371, YOUNG AND SHAW, raising of water. 11,718, WILKINSON, staircases. 11,865, ROWLEY and TILL, moulding articles in clay or other plastic material. 12,140, HOLDING, tool holders for slotting, planing and shaping machines. 12,848, WADE, apparatus for automatically delivering disinfectant or other compound to a charge of water. 13,299, SWITHENBANK, cleansing all kinds of street gulleys and traps. 19,427, HEATH, apparatus for holding and distributing paint. 20,267, SPIERS, apparatus to be attached to self-acting revolving shutters, whereby the shutters can be utilised as sun and weather blinds. 24,060, DRAKE and PELTON, acetylene gas burners. 25,431, BROUGHTON, method of treating a disintegrated slate mixture for the manufacture of useful and ornamental articles.

1900.—964, DECKER, combined smoke and gas consumers and fuel feeders. 1,053, WACHWITZ, SATTler and DUNKELSBUEHLER, manufacture of plated metal. 1,393, NORMAND, pumps. 1,822, HANNEBERG, apparatus for the collection and conveying of light or heat from the sun or other sources to the cellar, basement, or other dark rooms in buildings, etc.

2,871, LOOSE, locks. 3,057, REY and REY, apparatus for burning hydrocarbons, alcohols, and other combustible liquids for heating purposes. 3,378, FURER, trapped ventilating devices for waste-water pipes. 3,415, GARSTANG, bacteriological purification of sewage. 4,088, WISE (*Pendleton*), saw filing and setting machines. 4,411, HOHNE, wire fences. 4,470, KOCH, stone-planing machines. 4,533, KEER, machines for planing or French polishing wood. 4,535, HEISLER, pumping engines and compressors. 4,606, ANSPACH, devices for lighting gas at a distance. 4,683, ROTH and ISRAELSKI, brushes. 4,691, BEDELL and WELSBY, valves for flushing water-closets and drawing off liquids. 4,698, SIMONS, nut-locking devices. 4,762, BLAKE, pumping cars. 4,788, MOFFITT, apparatus for hanging wallpapers. 4,879, JACOBSEN, theatrical stages.

Professional Practice.

Gateshead.—There is nearing completion in Gateshead a new drill hall and men's quarters for the use of the Gateshead Battery, 1st Newcastle Volunteer Artillery. For many years the drill and other functions have taken place in the premises in Park Lane, which have been found too cramped, hence the erection of the present building. The new hall comprises a main hall for drilling, 80ft. by 47ft. 6in., well lighted and having a boarded floor. In addition, there is a clothing store, orderly office, officers' room, harness room, gunners' room, sergeants' room, armoury, and every convenience for the members. There is a parade ground, 79ft. by 55ft., where drill movements can be performed with ease. The building is of red brick with stone facings, and has been designed by Messrs. Watson and Curry, architects, of Newcastle. The contractor is Mr. E. T. George, Newcastle, whose manager at the works is Mr. Johnson Reed.

Glasgow.—The new central fire station at Glasgow, which was opened last week and is one of the finest in the kingdom, covers an area of 3,300yds., and has involved a total expenditure of more than £60,000, the site costing £22,750 and the buildings about £40,000. The station has two frontages—one in Ingram Street and the other in High Street, that in Ingram Street, four storeys in height, being the principal one. On the ground floor to the right of the entrance are the watch-room and the engine house, with accommodation for four engines. The offices are to the left, and comprise the chief officer's room, officers' and clerks' rooms, &c. Immediately to the rear of the engine house, and opening into it, are stalls for eight horses; and behind this are the fodder house, spare stables, machine and harness rooms. On the first floor, over the engine house, are two duty rooms, provided with sliding poles. A passage across the roof of the stable communicates with the recreation rooms. The remainder of this floor and the floors above are occupied by the officers' houses. The engine-house walls are lined inside with a fine selection of Grecian marble and polished granite, and the floor is laid with oak blocks. The High Street building is five storeys in height. The four upper floors are occupied by the firemen and their families, the ground floor being occupied as shops. At the south side of the courtyard is a block of buildings containing on the ground floor rooms for spare machines, workshops for boot-making, hose-repairing, engineering work, joinery, coach painting, and plumbing; and on the three floors above are rooms for the firemen and their families. Behind this building is situated the children's playground. Facing this block on the other side of the courtyard a range of one-storeyed offices is built, comprising wash-houses, laundry, drying room, smithy, oil store, electric shop, &c.; in the south-west corner of the courtyard is the hose-drying tower, rising to a height of 90ft., having on the top a test-room for all fire alarm, telegraph, and telephone lines; adjoining is the gymnasium, 55ft. long and 25ft. wide, and underneath is a store for

wood and iron. In every fireman's house is a bath, supplied with hot water from a steam boiler, which also supplies the water for heating and for domestic use throughout the station. The buildings throughout are lighted by electricity. All pipes, drains, and electric light wires, also the telegraph, telephone, fire alarm, and house bell connections, are contained in a subway which connects all the buildings. The elevation to Ingram Street is well broken up with oriels, gables, pilasters, and carving, but not overlaid with ornament. The elevation to High Street is built of the same materials as that to Ingram Street (granite and Lochaber red sandstone), but is less ornate in character. The station being built on the barracks principle, access to the firemen's houses can be had only from the Ingram Street entrance, and thus every person entering or leaving the station is under observation from the watch-room. The plans were prepared and the work carried out under the superintendence of Mr. A. B. McDonald, M.Inst.C.E., city engineer of Glasgow.

Pitlochry.—A public hall has been built on a site near the Pitlochry Established Church from designs (selected in competition) by Mr. Alexander Ness, architect, of Dundee. In the front portion of the building there is a spacious vestibule, with cloakrooms and crush lobby on the ground floor, and with a small hall and other accommodation above, while the hall proper abuts on it at an angle. This hall, which is seated for 500 persons, measures 60ft. by 33ft. 6in., the height being 24ft. The gallery has seating accommodation for about 90 persons. At the south end there is a stage 25ft. long and 14ft. deep, together with the necessary adjuncts in the way of dressing rooms, retiring rooms and baggage rooms. The walls and ceiling of the main hall are finished in pale green, the ceiling being panelled in tints to harmonise. The scheme has been very artistically thought out, and the whole presents a pleasing and inviting appearance. The building is heated by an effective system of hot-water piping. The contractors were as follows:—Mason, Stewart, Jamieson and Forbes; joiner, W. Sims, Moulin; slater, the late Mr. A. R. Butchart; plasterer, J. Veitch; plumber work and heating, Adam Menzies; painter, A. and W. Miller; ventilation, Climax Ventilating and Heating Co., Glasgow. Though the accounts in connection with the building have not yet been made up, it is understood that the total cost of the hall, including furnishings, has been about £3,000.

Wenhaston, Halesworth.—The church of St. Peter, Wenhaston, has been restored. The chancel was completed in 1892, and now presents very much the appearance it had before the church was spoliated in 1643. Two windows of late twelfth century date are retained in the chancel; the tower and nave arcade are of the second half of the fourteenth century, while the windows in the nave and aisle and south porch are probably not earlier than the sixteenth century. It was whilst working on the chancel that the remarkable painting on oak, "The Last Judgment," was discovered at the east end of the nave. The Society of Antiquaries suppose it to have been painted about 1480, and covered up since 1549, in obedience to a Parliamentary edict of that date, and it thus escaped the violence of the iconoclast Dowsing and his emissaries. Notwithstanding the covering of centuries of whitewash, the brilliancy of the colours is remarkable. After undergoing the ordeal of exhibition in London, it now adorns the gallery of the church, and the vicar extracts an admission fee in aid of the restoration fund from the visitors. The panel is 17ft. 3in. wide at the bottom, and 8ft. 6in. high. When the chancel was completed, it was felt that the dilapidated floor and decayed and uncomfortable pews needed attention, and this year sees the completion of a new floor of oak blocks, the walls and ceiling renovated, the old pews substituted by chairs with plush kneelers combined, and Musgrave's patent hot-water pipes fitted. The architect was Mr. E. F. Bisshopp, of Ipswich, and the contractors

were Messrs. Kersey, of Woodbridge. It should be added that the old carved Jacobean work of the fifteenth century, and the poppy-head work, have been preserved and utilised in different parts of the church; also that experienced archaeologists are of opinion that more frescoes are almost certainly concealed by whitewash, which still disfigures the walls. The work, including that in the chancel, has cost £900.

Yarmouth.—The new Seamen's Institute on the South Quay, which was recently opened by H.R.H. the Duke of York, has been designed by Messrs. Bottle and Otley, the builder being Mr. William Cork. The cost is £2,250. The building occupies a site of about 28ft. frontage to the quay, with a depth of about 90ft. On the ground floor is the Seamen's Institute, 68ft. by 28ft., and 12ft. 6in. high, with a storeroom at the back about 15ft. by 12ft. The mission church is on the first floor, 68ft. by 28ft., and 22ft. in height to the apex of the roof, with vestry adjoining, the same size as the storeroom below. The main entrance to the Institute is from the quay, with outer and inner swing doors. The church has a broad staircase of pitch-pine leading from an entrance lobby. There is also a ladder staircase from the vestry, leading to the open space in the rear. The external woodwork of the west front, facing the quay, is of teak of an ornamental character; the ground floor has a projecting central porch, with canopy over, and large moulded windows on each side, so that those using the Institute will have a good view of the quay and river. The church has a seven-light perpendicular Gothic window at the east and west ends. The chancel floor at the east end of the church is raised. The roof of the church is open-timbered, with curved principals, and an arcade on each side. The windows are filled in with tinted cathedral glass.

Keystones.

Brighton Aquarium is to be bought by the Town Council for £30,000. The building originally cost more than £100,000.

A Nursing Institute at Northampton is being built at a cost of about £4,000. Countess Spencer laid the memorial stone last Thursday.

New Abattoirs at Benwell, Newcastle-on-Tyne, have been built. They are a compact range of brick buildings enclosing a cemented yard.

A new Presbyterian Church at Didsbury is being built at an estimated cost of £5,000 from plans by Mr. Henry Lord, architect, of Manchester.

A new Church at Beeston, Nottingham, is being built from the designs of Mr. Robert C. Clarke, of Nottingham, by Mr. William Fletcher, of Beeston. The estimated cost is £1,500.

Old Steelwork.—Birmingham has followed London's lead by arranging in the Municipal Art Gallery a portion of the exhibition of antique steel and ironwork recently held in the metropolis under the auspices of the Burlington Fine Arts Club.

St. George's Church, Leeds.—The corner stone of the apse which is being erected at the east end of this church was laid on Thursday last. It is proposed to re-roof the building, to renovate and paint the interior, provide new pews, re-arrange the heating apparatus, and instal the electric light. The cost of these improvements is £6,000. Mr. H. Walker is the architect.

Edinburgh Architectural Association.—The annual business meeting of the Edinburgh Architectural Association was held on Thursday last, Mr. James Bruce, W.S., presiding. Satisfactory reports were submitted by the secretary and treasurer, the accounts of the latter showing a credit balance of £116. Office-bearers for next session were elected as follows:—President, Henry F. Kerr, A.R.I.B.A.; past

president, James Bruce, W.S.; vice-presidents, A. Hunter Crawford, architect; Robert Wilson, architect; honorary secretary, T. Fairbairn, surveyor; treasurer, John Johnston, C.A.; librarian, J. A. Carfrae, architect.

The Fleming Cottage Hospital at Aberlour, Banffs., which was recently opened, has been built at a cost of about £4,000 from the designs of Messrs. Dun and Findlay, architects, of Edinburgh.

After the Fire.—The sum of £8,200 has been voted for the restoration of Government property destroyed by the great Ottawa fire. Large numbers of workers are now engaged clearing sites and rebuilding the city.

"Some Rich Districts for Architectural Photographs" is the title of a short article by Mr. G. A. T. Middleton, A.R.I.B.A., which appears in the issue of "The Amateur Photographer" for May 4th.

A new Presbyterian Church at Llandudno Junction has been built at a cost of £1,200. Mr. A. W. Smith, of Manchester, was the architect, and Mr. D. Evans Jones, of Colwyn Bay, the contractor.

A Hospital at Tindall Crescent, near Bishop Auckland, has been erected from designs by Mr. William Perkins, M.S.A., of Bishop Auckland. The total cost was £7,338, the site comprising three acres of ground.

Strike of Journeymen Painters in Wakefield.—In January the men asked for an advance of their wages from 7d. to 8d. per hour and agreed to accept 7½d. and a signed code of rules for twelve months. As the rules had not been signed on May 1st the men struck work.

Statue of the Queen for Paisley.—The statue of her Majesty which a Paisley gentleman proposes to erect in the centre of the Dunn Square, Paisley, will be a replica of the memorial statue by Mr. Francis J. Williamson erected at the top end of the Thames Embankment. The pedestal will be 7ft. high, and the statue 6ft. 10in.

New Companies.

Hattersley Brothers, Limited.

This company was registered on April 9th with a capital of £50,000 in £1 shares to acquire the business of oven foundries, stove and grate manufacturers carried on by T. Hattersley under the style of Hattersley Brothers and Co., at Queen's Foundry, Swindon, near Rotherham; and to carry on business as manufacturers of every description of kitchen ranges, cooking stoves, fenders, fire irons and brasses, tiled or other hearths, ornamental and other castings, hat and umbrella stands, gas and electric light meters, water cisterns and pipes; as furnishing and general ironmongers, &c. The first directors (of whom there shall be not less than two nor more than five) are to be elected by the signatories, T. Hattersley, M. Hattersley, C. H. Hattersley, M. Hattersley, T. F. Hattersley, H. G. Hattersley and W. Dust. Chairman: T. Hattersley, who is also managing director.

COMPETITION.

PROPOSED NEW WESLEYAN CHURCH and SCHOOLS, NORTH SHORE, BLACKPOOL.
The Trustees of the Mount Pleasant Wesleyan School Chapel, North Shore, Blackpool, invite Architects to submit DRAWINGS for their New Wesleyan Church and Schools.

They offer premiums of £25, £15, and £10, to be awarded for the designs adjudged of sufficient merit and placed first, second, and third in order respectively.

Particulars of the competition may be had from the Rev. G. PENROSE HODGSON, 9, Chesterfield-road, North Shore, Blackpool.

Ruskin's Turners. It appears to be the rule that notices of Turner's work shall be nothing if not eulogistic, which, at any rate, makes them dull reading and the voice of the critic to sound like the hollowest echo of Ruskin's extravagant lauds. Take this, signed A.M.S., from one of the cheaper dailies; it is pretty enough of itself, and probably turned out as easily as the street "music of Handel," which sets the kitchenmaids dancing:—"To attempt a description in words of Turner's pictures is to attempt the impossible. Like the musician, he makes a simple and direct appeal to the emotions through a particular sense. One hardly knows which to admire most, the sheer beauty of the vision, which is one thing, or the miracle of skill by which it is represented, which is another." Now this and what follows is "copy," mere "copy," although of the prettiest sort, and would not detain us a moment were it not that in the next paragraph the writer says something which gives others a right to speak. "There was nothing that Turner in the plenitude of his genius would not dare to paint, from the sun in the heavens to the most evanescent iridescence, or a sudden flash through a storm. It was on grandeur that his eyes were fixed—grandeur in the manifestations of Nature, grandeur in the works of man's hands; ships, bridges, and spires; a towering ship to ride the deep, a long league of arches like a bridle to subdue a mighty river, or a roof scaling like a man's mind to heaven! All these are to be found here in pictures which the pen of Ruskin has made famous to thousands who have never seen them."

The most noticeable lapse in this vain-glorious period is "from heavens to iridescence," but the effect of the whole is sublime.

There was an article in the "Art Journal" a few months ago the idea of which was to determine the limits of achievement in the landscape painter's domain, and although it proved disappointing, there were many who thanked the author for what he attempted to do, for there is no one so straitly confined within what should be obvious limits as the unfortunate painter, and no one so prone to make himself ridiculous by essaying what he should not. What gives or seems to give the distinction of style to art work is the suggestion of individuality conveyed by the artist's selection, not of the subject only but of an idiomatic mode of presentation, whereby it

is hall-marked as his own, and either hailed with delight or derided. The Turner of later days, he who "dared everything," courted comparison only with Nature, and, apart from the fact that his technical resources were altogether inadequate, the consequence was that the disparity between the endeavour and the achievement was only too often ridiculous. Lord Bacon might boast in his day that he took as his province "all knowledge," but he was not thinking of

adopting the comparative method which shows Turner amongst his coevals and forbears one may profitably study his works, and be sure of the purest enjoyment; pure enjoyment derived, not from the early works only, but from what is best in the others, as well, and particularly from the marvellously-painted studies of fishes and birds. The resultant impression will be that Turner habitually attempted more than he could hope to attain. The heavens were opened to him, and, seeing

ARCHITECTURE AT THE ROYAL ACADEMY. DRAWN BY C. E. MALLONS. (See p. 261.)

painting, and Turner should not have done it. If he could have known what Nature, not Ruskin, thought of such work, he would have been wiser and better, and less bosh would then be in the papers.

The contention that the highest art is severely restrained and conventional can be supported by examples of all possible kinds of work. Let Albert Dürer and Whistler represent the extremes, and let others give Turner his place. With this reservation, and

how new it all was, a great many eyes were opened while he was doing his best. Amongst his most hopeless failures, excepting for qualities always his that are never entirely lost, may be reckoned with few exceptions his Swiss and Italian views and all his pseudo-classical illustrations of poets. There is more than a hint of my own limitations in this inadequate article, but it is hoped that it may help others to see that they had better think for themselves than take on trust what they read.

E. R.

Changes at St. Martin's-le-Grand.

MUCH post office history has been made at St. Martin's, although it must by no means be supposed that the business of the General Post Office has always been carried on here. The story of the Department goes back to the time of Charles the First, when it was situated in a lane off East Cheap, afterwards being removed to Lombard Street, in which the General Post Office was situated until 1829. The so-called "old" G.P.O. is therefore not so old as may be thought, and the adjective is only admissible in relation to the huge telegraphic and administrative blocks built in modern times on the northern side of St. Martin's, officially known as "G.P.O. North" and "G.P.O. West." The "old" General Post Office—Smirke's gloomy pile—was opened in 1829 and many years ago business outgrew the capacity of the building, so that additional rooms were excavated below the old foundations and under the yard, and somewhat later an additional storey was imposed upon the classic proportions of the elevation. But the Office of Works toils in vain after the continually increasing demands for space, and now that more room is required it has been decided to demolish the building altogether and to start afresh, presumably on the models of the buildings of 1873 and 1895 opposite. To anybody, save a Government Department, those buildings might be supposed to act the part of the drunken helot of ancient days, and of the "awful example" of modern times, for they are among the most dreadful productions of the draughtsman's office, and, as the newer building is distinctly worse than the one of 1873, they exhibit a gradual decay of taste which leads us to expect the worst in the rebuilding scheme on the opposite side of the street. "G.P.O. West," inaugurated by that most unpopular of First Commissioners of Works, Professor Ayrton, in 1873, is bad, and was violently assailed at the time; so that it was opened amid a cloud of official apologetics, deprecatory of criticism, and calculated to disarm comment upon the style, or lack of style, in which these immense barrack-like offices were designed. "I have read criticisms of the style in which this building has been designed," said the Commissioner, "but it is an example of the Post Office Order of Architecture, and an admirable specimen of its class." Professor Ayrton was not a jocular person, and so cannot be accused of intentionally making a play upon words when he spoke of the Order. If one cannot endorse his description of the building as an "admirable" specimen of its class, we can at least sorrowfully admit that it is certainly "characteristic" of the Department's efforts in architecture, as exemplified in the succeeding twenty-seven years, a period showing a long series of works undertaken in the most cynical spirit of mere utilitarianism. Side by side with these degraded specimens of public architecture, these times have witnessed the growth of the artistic sense among commercial and professional bodies who have erected buildings alike imposing and beautiful. It is curious to notice, for instance, the contemporaneous rise of the hideous "G.P.O. North," with its alleged "decorative sculpture," and the Institute of Chartered Accountants. But the pity of it; what opportunities wasted in not rendering the rebuilding of the G.P.O. an occasion to fitly celebrate, in enduring brick and stone, the doings of England and the Empire with the uttermost ends of the earth. C. G. H.

On Reflection.

Light and Shade. THE St. Martin's Vestry has been seeking the light (as every progressive vestry should), and the result is noteworthy. The vestry would have light—the very best electric light—and with this laudable intention in view it zealously grappled with the powers of darkness. We can imagine the flow of oratory that furthered the proposals. Shoreditch might have her destructors, West Ham her technical institute, Lambeth her hardwood pavements, but St. Martin's—yes, St. Martin's would show them how electric lighting should be done. Their work should be heard of throughout the metropolis; they would startle London. And this they have most effectually done—though not quite in the intended manner. In one short week cast-iron abominations had risen from the footways—vulgar, ostentatious, florid things that quarrelled with the gas-lamps, sneered at the Nelson Monument, and were grossly offensive to the man in the street. But to the St. Martin's Vestry these things occasion a deep and holy joy. It is proud of them. It has even had its name cast on the base "lest we forget." Did the vestry imagine we should ever forget? But this was not all. The choice of a pattern by no means exhausted the vestry's artistic capabilities. The shafts had to be painted. Such an important item as colour could not be hurried. Personally, we have our own opinion. We think these shafts in any colour would be as black. But the vestry had a dozen painted in various colours, we presume to ascertain the effect, unless St. Martin's is striving to emulate the example of its sister St. Giles, whose lamps are painted, so it is said, to match the passing busses. If the vestry has emerged into a new light we fear its artistic qualities have not yet made themselves conspicuous. What colour for these standards has been finally decided upon we do not know. The standard that was half blue and half red was very pleasing. We suggest that a short length of white between the red and the blue would make the columns at once emblematical and patriotic. And what more could anybody want?

The Personal in Church Art.

WITHOUT entering upon the rough waters of the controversy between the Church Crafts League and the Clergy and Artists' Association, we may express a general satisfaction that so much is being done to improve the decoration and furniture of our churches. For long this work has been in the hands of firms that manufacture the works by the division of labour and by machinery, and, consequently, the interiors of our temples of worship have been characterised by the negation of good taste. In fact, churches have in many cases become store houses of tawdry, meaningless, machine-made ornament and furniture. It is almost superfluous to point out how lamentable such a degradation of human industry is when associated with divine worship. We are glad to see in the annual report that the Clergy and Artists' Association is making good progress in this resurrection of taste, and we understand that the Church Crafts League is also doing considerable good. The annual report of the Association shows that the membership has been added to by forty-one, and that the number of applications for advice upon decoration, &c., and for names of those to entrust with work, has been forty-nine in the past year, an increase of thirteen on the previous one. The income has been £170 3s., as against £168 3s. in 1898, and the deficit has been reduced from £40 1s. 8d. to £33 14s. 10d. The Church Congress Exhibition at Leighton House, under the auspices

of the Association, was a great success. We cannot entirely agree with Mr. Reginald Hallward, hon. secretary, in the following passage: "The artist who does the work himself, perhaps aided by one assistant only, appears in the eyes of a committee of business or commercial men, who judge of success by the number of hands employed on the job, in a very unedifying light. Now if he were a large employer, and sat on the boards of several companies, his fitness would be recognised at once. In their eyes, the unfitness of the artist is that he does the work himself, instead of employing someone else to do it." We do not consider any person of even slight education would really hold that the work of a firm is better than the work of one artist or the co-operation of a few on a large work. We believe the fact of the matter is the want of appreciation of the need of first-class work in a place of worship, local favouritism, and—cheapness. Until the duty to the worker is better understood, and that a bad or mediocre work is dear at any price, personal art will not be universal in our churches.

An Instalment of Reform.

THE times are not propitious for any kind of domestic reform, and we must therefore be properly thankful for even the very small modicum of reform which the Government offers us in regard to that most difficult and pressing problem—the housing of the working classes. The Housing Act Amendment Bill, which is now before the House of Commons, will, if passed, accomplish one desirable reform which we have more than once advocated in these columns: It will enable a local authority to acquire land for workmen's dwellings outside its own boundaries. It would be difficult to over-estimate the benefits to the tens of thousands, who in every great city are crowded together in insanitary slums or barrack-like blocks, that may result eventually from the adoption of this simple reform. The imagination loves to fancy the working man of the future returning from his daily work to something very like a model village; instead of crowding into a couple of rooms, or maybe a single room, in an insanitary city house, each family has its own cottage, and each cottage has its garden; architect and builder have done their part, and, freed from the necessity of accommodating the greatest possible number on the smallest possible area at the lowest possible cost, have erected neat little cottages which are at once convenient to live in and pleasing to the eye. It is an alluring picture, but let no one suppose that anything like this is to be realised as the immediate result of the passing of Mr. Chaplin's bill. Mr. Chaplin himself is under no such delusion; indeed, he frankly admitted that this was not a final measure in regard to the housing question, and that the question would have to be dealt with again. The pity is that in making his proposals Mr. Chaplin did not see his way to embody others which would give the scheme some sort of completeness; indeed, we doubt whether the bill, if passed as it stands, will not remain to a great extent a dead letter for want of some such supplementary provisions as Mr. Robson suggested in the amendment he submitted to the House. A country cottage is no good to a town worker unless he can get to and from his work in town quickly and cheaply; and a country cottage is out of the question for a working man with a large family unless the rent is very low, which it cannot well be until the financial restrictions which at present apply to housing schemes undertaken by local authorities are considerably relaxed. While welcoming the Government bill as a step in the right direction, we regret that these and other important factors in the problem have not yet received attention.

FROM A SKETCH BY C. E. MALLOWS.

ARCHITECTURE AT THE ROYAL ACADEMY.

SECOND NOTICE.

ANOTHER design to which the remarks in our first notice are, to a certain degree, applicable, is that by Mr. Aston Webb for the Royal College of Science. On the whole, however, it is a better design; it is broader, simpler, and more dignified in treatment; although, of course, the accident of its greater length helps it to some extent. But what we cannot help feeling is that, like the Eastern Telegraph Co., it is least successful where it is most novel. The general effect of the two recessed parts joining the centre with the end wings is successful enough, where precedent has been more nearly followed; although this might have looked better if the columns had been spaced a little further apart, had the proportion between the order and its basement been happier, and had the temptation to give a novel treatment to the heads of the ground floor windows been resisted. These window heads seem to us to be rather unreasonable, and to weaken the general effect; a firm, sharp line here would probably have had more value, and might have helped the general proportions. The entrance block and the two end blocks appear to us to be the least successful parts as well as the most novel.

The last few years has seen a fashion spring up for the employment of some form of the Renaissance for monumental work, but we must say we think that those who so employ it work to a great extent upon wrong lines. They do not seem to possess sufficient knowledge of the structure and character of the style. This particular style is a very flexible medium for expression, its variations are well nigh infinite, there is therefore much to be learnt. It differs in this respect from the purer but more limited style of the Greeks or that of the Middle Age. This flexibility and adaptability make it, to some extent, suitable for modern requirements, but it needs to be handled with much knowledge and judgment. What can be done in the way of novelty, while yet keeping to the spirit of the style, may be seen in the works of some of the best contemporary continental architects. This we imagine is not the result of greater ability, but of greater knowledge.

The design by Mr. J. M. Brydon, for the circular court of the new Government offices, is one that merits attention. It is too often

the custom for the critic to accept the general idea of any design as he finds it, and to confine himself to saying whether he likes or dislikes the effort produced. A moment's consideration in this case, leads us to ask whether this circular form for the courtyard of an office building, is the best form; whether it is characteristic and appropriate. It seems to us that it is not; that it necessitates too much sacrifice of space on the plan; that it creates too many awkward shaped rooms and useless spaces for an office building. It does not seem to be the inevitable outcome and expression of the necessities of the case. Had a plan been given with this design, it would have been interesting to see how this effect is produced. It appears to us that this treatment would have been more appropriate to a palace, as used, for instance, by Philibert de l'Orme in his design for the Tuileries, where an oval-shaped arrangement is introduced. In a palace it may be permissible to make a greater sacrifice of space and convenience, for the sake of effect, than it is in a group of offices. Although in a building of this national importance, a monumental effect of grandeur is required, yet some sense of proportion should be preserved; and if the grandest treatments are adopted for offices, what is left for buildings of still greater magnificence?

No doubt the curiously shaped rooms and spaces, created by this treatment, can be used for their practical purpose, but they would have been still more suitable had they been square, and this courtyard would have been more characteristic and more artistic had it been square also. It may be a fine effect in itself, but the question is—is it the right one?

Apart, however, from this vital question of the general idea of the design, the effect does appeal to one as being quiet, simple, restrained, and dignified; but what one misses is that exact relation of one part to another, that subtle and exquisite proportion and relative value of every feature to every other feature, which creates harmony, and which strikes on the senses like a full rich chord of music; the effect produced, for instance, by certain parts of the internal courtyard of the Louvre.

There are several other designs more or less in this style, which we have no space to

consider in detail. The best is, perhaps, that by Mr. T. E. Colcutt for Lloyd's Register of Shipping—though the attic storey seems a little heavy in treatment compared with the ground floor—and the worst is, perhaps, that by Mr. H. H. Statham, for the Cartwright Memorial Hall.

There is great interest attached to the few designs of an ideal nature which have found their way into the exhibition. The most important of these is a design for a town at the entrance of the proposed submarine channel tunnel, by Mr. J. Kotéra. This is not the time to enlarge on the value of this ideal sort of work, but we recommend everyone to make a point of seeing this particular specimen. It has composition and grouping and modelling, and, from the purely architectural point of view, is perhaps the best thing in the exhibition. To the left of it hang two small frames, one of which holds detail studies, which are most charmingly drawn, and which show some originality of treatment. The other is a small monumental design, which appeals to us more than the larger subject, and which is, to our mind, finer still in idea and sentiment. These designs should not be missed.

Another ideal design is one by Mr. Beresford Pite for a street front, in glass mosaic and faience. Mr. Pite's work is well known to us all, and it really is interesting to see how he looks at a subject such as this, and what he would do with it. We do not quite like the way the large circular arch is cut up with a central column below the level of the archivolt, and two mullions above. It does not look structural, and is a little unhappy, and we are doubtful as to the effect of the wavy lines of ornament, and the window heads to the upper floors, and the solid pier coming over the centre (but not exactly central) of the arch below; but the design as a whole has distinct charm, and is most interesting as a genuine attempt to solve a problem which for years has been crying for solution.

Other ideal designs are a façade of a military museum, by Mr. J. E. Spain, in which the special character and sentiment of the subject is not sufficiently emphasised, though the design shows knowledge of style—a modern country house in the eighteenth century manner—which is interesting, if somewhat

FROM A SKETCH BY C. E. MALLOWS.

paradoxical in title—and an entrance lodge, by Mr. H. Inigo Triggs, all of which have the interest of this sort of work.

If we come to compare one class of building with another we come to the conclusion that the small country houses are far superior to the public buildings and monumental class of work. This is only what is to be expected. The country house appeals strongly to the domestic sentiment of the average Englishman, the problem is simpler, the restrictions are fewer, the subject is smaller; it is more easy to grasp and to handle. It is possible to group and model the building, to control the large masses and the skyline in a way that is not possible in a town house, and which, in a large public building, requires a natural grasp of mind, a wide knowledge, and a severe training which does not come in the way of all of us. In many of these small designs there is simplicity, a naturalness, and a directness which appeal to us most strongly, particularly as a contrast to the laboured, worried, and affected productions with which the room is full. Of these country houses we noticed some cottages at Shellingford by Mr. W. H. Atkin Berry, a house at Warlingham, by Harrison and Ward; Sand Hill Close, Hitchin, by Mr. T. G. Lucas, Ickleton Grange, by C. A. Nicholson; a house near Hythe, by J. A. Minty, and the "Stranger's Corner," by Harold Falkner. All these designs are, no doubt, open to criticism, but the majority of them have a quality which disarms it. With regard to the last-mentioned one, however, the drawing which illustrates it invites criticism. It is an affectation; it is not sincere. More thought has been given to the quaint way in which the mount is divided up, and to producing spidery lines showing trees and sky, than to illustrating the qualities and character

of the building. We do not want to know what the illustrator can do with his pen; we want to know what the architect can do with his building, and this drawing does not explain it as well as it might.

As it is out of the question to attempt to discuss every interesting design in this exhibition, we cannot say all we would wish about such work as Mr. Prior's medical schools at Cambridge—not so successful, we think, as his domestic work—Messrs. Hall Cooper and Davis's design for Plumstead Municipal Buildings, the Free Library at Leamington by Mr. Newberry, the Bristol tramways by Mr. Green, competitive design by Mr. Macartney, public school by Mr. J. S. Lee, Plumstead Municipal Buildings by S. Russell, C. E. Mallows and Grocock, public baths by R. S. Ayling, Cartwright Memorial by H. Cheston and J. C. Perkin, and Leamington Science and Art Schools, by C. E. Mallows and Grocock. Or, again, of the work shown by Mr. R. W. Schultz, A. N. Prentice, Reginald Blomfield, and many others. All these designs have some quality or charm in their different ways that will repay inspection.

There are others that do not repay inspection, and we wonder how they came to be admitted. No. 1699, a scheme for the supply of water to London; 1768, a new public library at Forest Hill, are specimens, though possibly not the worst.

St. Levan Church, Stoke, has been reopened. Immediately after it was opened in November, 1898, it was found that its acoustic properties were so defective that important structural alterations and additions would have to be made. These have been carried out at a cost of about £800. An organ, costing £250, has also been placed in the church.

FROM A SKETCH BY C. E. MALLOWS.

THE PRESIDENT (MR. G. H. FELLOWES PRYNNE) EXPRESSES APPRECIATION.

THE A.A. SOIRÉE.

THE Architectural Association was in a light and happy vein on Wednesday and Thursday evening last. As our readers are aware, it has been their practice for some years past to hold an annual soiree and musical play—a form of diversion which has never received a more hearty reception or been more successful than it has this year in "The Mayor of Montillado." For the "book" of this Spanish romance, Mr. F. Dare Clapham is responsible, and though the lyrics, as a whole, lacked that piquancy which is so desirable, but so difficult to obtain, there were dozens of clever and amusing references and retorts in the patter. The following was the cast:—

Don Muria Maduro ... (mayor of Montillado)
Mr. G. B. Carvill.
Don Juan Purlino ... (an architect)
Mr. Alfred Stalman.
Luiz ... (his assistant, and son of Bodega)
Mr. S. Constanduros.
Biero Bodega ... (landlord of the inn)
Mr. F. Dare Clapham.
Rosita } ... (his daughters)
Juanita } Miss Sophie Tyler and Miss Grace Wylde.
Carlos } ... (friends of Luiz)
Pedro } Mr. A. S. Vernon and Mr. Gervase Bailey.
Antonio Amillo ... (foreman mason)
Mr. A. W. Bentham.
Diego } ... (masons)
Alvaro } Mr. Frank Carvill and Mr. Bernard Lang.
Carmen } ... (flower girls)
Mercedes }
Inez } Miss Ada Yerbury, Miss Evelyn Jackson,
and Miss Rose Webb.
Dolores ... (the mayor's daughter)
Miss Annie Roberts.

Chorus of flower girls and masons:—Mesdames Edith Burn, Nellie Carvill, Florence Clayton, Jessie Maude, Kate Rimell, Mabel Tunstall, Lilian Webb, Violet Whichcord; Messrs. F. W. Baker, H. Banister, S. Elston, C. Harrington, H. Harrington, A. C. Kelly, C. Pellew, A. W. Smith, A. Smithers, R. Towers, A. H. Whichcord.

Those who remember last year's comedy, "The Druids' Elect: An Episode of the Ancient Britons," will see that there has not been so much play on the names of the characters in "The Mayor of Montillado," Purlino being the only architectural freak. Last time the characters included Lucius de Rougepot, alias Grennus (who made his entry on the stage to the last bars of "The Wearing of the

Green"), Ashlar and Rubble (ancient Britons, candidates for the Council), a first druid called Owen Rent, a correspondent named Pennialinus, and the very ingenious titles Ellalyn and Lettilyn (British maidens). But to return to the Spanish romance.

It opens with a chorus of flower girls and masons in the market-place of Montillado, and when the latter have been conquered and are buying the flowers that shall make their "daily toil seem lighter" Don Juan Purlino, the architect, comes on the scene and sourly demands the reason why his masons are not at work on the new town hall. Purlino is a cadaverous-looking man, dressed in a dingy black suit and a hat that reminded one of the Gunpowder Plot, only the feather and the big boots were missing. This architect has become most prosperous, and is the president-elect of an honourable society, hoping to occupy the P.R.I.B.A. chair next year; when this has been arranged he has determined always to lunch at Sweeting's before important meetings. Here is a little more light on his character:

Prominence of course I seek,
And as I have no end of cheek,
I never miss a chance to speak
Anything for notoriety.

If in your work you would succeed,
I'll tell you what has been my creed,
To always move, and drink, and feel,
In the very best society.

A man of such high motives as Purlino is, of course, deserving of success, and he is evidently appreciated, for half his jobs, he says, were got in this way.

It may seem odd, perhaps, that the young architects of the Architectural Association should thus satirise their own profession. One learns, however, before the play has proceeded very far that it is only the great and eminent ones of the profession against whom these shafts of wit are directed; Luiz, the architect's assistant, is as gallant and amiable a youth as one could meet in a summer day.

The foreman mason comes forward and tells Purlino that one of the reasons of the delay in the building is that all the subscribers want their names on the foundation stone, some having given extra donations on the condition that their names should appear in large letters. "Call again when we get up to the cornice," says Purlino to the girls who try to sell him flowers; he really was a most important man, only he had to be continually reminding people of the fact. His foreman presents to him the eighth-scale drawings and says they show a 9in. layer only of concrete under the tower, a little peculiarity which is explained away by the fact that it was done to reduce the cube. Then the district surveyor had said no damp-course was provided. "Oh! then show it to the office boy," replies the fretful Purlino. At this point we have an interruption in the technical allusions by the entry of the innkeeper's daughters, Rosita and Juanita, and the two gentlemen who desire to take them on the water that evening, one of whom expresses his intention to bring the guitar and sing. "Not that, old man," says his friend, "you know what happened last time." Rosita, however, arranges matters for her lover, who "sings all right when it's calm." But the assent of Bodega

PURLINO AND THE MAYOR.

to the whole arrangement is needed, and this his daughters get in a trio. Next we have a drinking song. One always associates a song of this kind with the people of hot countries. Luiz has a rich baritone voice, and "Here's to the Maid of the South," which has a mellow, flowing air, called forth loud applause.

Now comes the great entry—the mayor and his charming daughter Dolores. There were two Dolores on the London stage on Wednesday and Thursday last, one at the St. George's Hall and the other at the Lyric Theatre, and both scored a great success with their songs. His Worship the Mayor told us in the duet with his daughter that he was "broke," and that he always wore his ermine gown, but, though the first statement was apparent, it would be difficult to describe the garment which enveloped him, for it seemed to be a mixture of a khaki-coloured brocade and a seaside bathing-tent. In fact the mayor was "rococo." Then there was his head. The bottom portion was natural, but the upper part consisted of a false forehead of the equilateral triangle variety, with a tuft of fuzzy hair at the back. But everyone agreed that Maduro and Dolores were excellent. The mayor's advice should be taken to heart. He says that if an alderman or a man in high position who has many daughters finds he "can't afford to clothe them and provide their daily bread," well, he can ask for plans of buildings, advertise a competition, which is open to all batchelors, and besides a premium he can just throw in a daughter as an extra little plum.

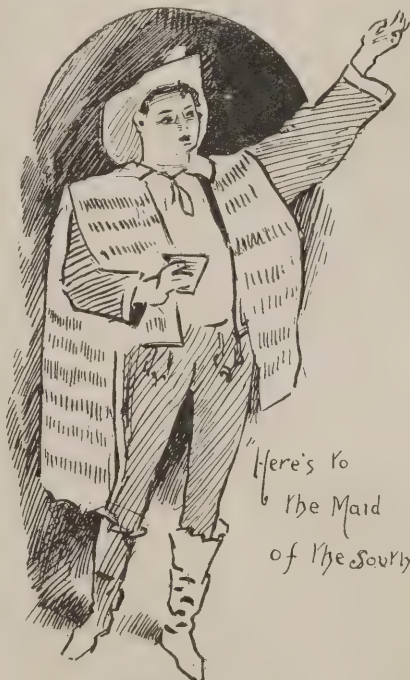

Besides all this, the mayor is a very busy man. The day in question he opened at 10 o'clock with the unveiling of a new fountain and cattle-trough (we have his authority that the first water that came through tasted of red lead and dried leaves); then at 11 o'clock he had to be on the Baths Committee to discuss the question of allowing the diving horses to perform on Wednesdays—eventually it was decided that they should be allowed, and that Fridays should be apportioned to the monks. Other functions keep him busy through the day, and he finishes up with a bull-fight at 9 o'clock, followed by fireworks.

Luiz wants a ticket for the foundation-stone ceremony. "But your master, Purlino, had six," says the mayor. "Yes, I know, but he sent them to the heating engineer, who wanted them for his typewriter's sister." A little more music came in here from Dolores again, who sang "Across the Bay" with great taste and feeling.

We have now a dialogue between the mayor and Bodega, in which the former explains that the reason why Montillado had to have a new town hall and new baths was because other towns had them. Why, a pottering little place like Sneezio went in for the influenza, so Montillado was bound to follow suit, and the mayor took the lead. Then there were Purlino's fees. What fees! The contemplation of these, in view of the depleted condition of the municipal exchequer, causes the worthy mayor no little embarrassment, because—as he sings,

You feel so very funny
When you're running short of money,
And your balance at the bank is rather low.
When you find you have to burrow
For your dinner on the morrow,
It makes you feel so very, very low.

But Bodega devised a grand scheme to extricate the mayor out of his difficulties, by which

LUIZ (MR. S. CONSTANDUROS).

Purlino was to forego his charges and have in exchange the hand of Dolores. After this business has been arranged, Purlino enters, and then follows a most amusing dialogue between him and the mayor (it begins with "Very nice day. Very nice people out on Monday") in which the latter eventually comes to the point. Purlino accepts, but says (aside) he must make it up out of the provisional amounts. The maiden, however, has been overlooked, and being of a fiery nature, and in love with Luiz, resents the idea. Purlino then begins to threaten, produces a ghastly bill of indefinite length, and the curtain to Act I. drops with the various ladies supported in the various gentlemen's arms, and the poor old mayor fainting in Purlino's.

We have the same market-place before us in the second act, and an opening chorus of masons, followed by a song by the mayor (who has just been elected to his position for the second time) "Isn't that a funny thing to do." There was a topical war verse in this song, ending with "Oh! wasn't that a 'Powerful' thing to do." (A year is supposed to elapse between the two acts.) It should be mentioned that, owing to his money troubles, the mayor's hair and moustache had turned white. He is still short of 400 (pesetas.) He'd tried to raise the money. He'd taxed motor cars, but that didn't succeed. Then he

END OF ACT I.

ROSITA AND BODEGA.

arranged a benefit bull fight, but two men were killed, and he had to pay compensation to the widows under the Employers' Liability Act; so he lost on that. He thought he might do something with the Corporation plate, but then he found out that it was only plated, a predecessor having been struck with the same idea. However, he grants the masons the holiday they ask for.

As has been shown, Purlino is a wonderful man. But there's much more to learn about him. "When I was 'prentice," he tells Bodega, "I won the Soane. It was not given away with a pound of tea in those days—so anyone couldn't get it. Then I got tight—I mean the Tite." "I've heard about you," remarks Bodega. "Was it 40s.?" Purlino scowls. "I speak languages you know," he adds. "An architect must be able to speak languages—good language and bad language. Besides, the King has made me a D.S.O.—that is, a District Surveyor in Ordinary."

The impecunious old mayor has several friends, of whom the innkeeper's daughters are most sympathetic, and they decide to find out from the private secretary how much Purlino's fees amount to, for "what's the good of a private secretary if he can't give you private information." There is a clever little sally against Purlino. He says:—"I just drop in you know to have a little chat." "You mean," says Bodega's daughter, "chat and have a little drop." This reminds one of the old lady's assertion that bridges were made for boats to go under, or of some of Lewis Carroll's sayings.

DOLORES (MISS ANNIE ROBERTS.)

Dolores has still another effective song, "Sleep," and later on Luiz sang "Listen, my Darling," with great effect; but the mayor is still "broke," and Purlino equally threatening. The opening ceremony is on foot, and the mayor agrees that it would be well that the famous strolling musicians should be there, for opening ceremonies generally want something to liven them up. There's always a long notice in the morning paper in which the reporter may, in a fit of absence of mind, mention the architect's name; the name of the man who made the gold key is always mentioned. The reference to gold sets Purlino threatening once more, and he emphasises that he is not "Carvilling" (a dreadful pun on the name of a leading performer). "How about something down and the rest by instalments?" suggests the mayor. "Do you think you can have architecture on the hire system? No!" says Purlino.

Everything, however, ends well, for Luiz and Dolores, who ran away to be married and have been round the country as the strolling musicians, "discover themselves" and make up the 400 pesetas that are owing; but before this they sing their song, and so increase the funds, having received a considerable contribution from the unsuspecting Purlino, who falls in love with the masked Dolores and

requests her to "Call me Purly." Then the chorus winds up for the finale, everybody is satisfied, and the curtain falls amidst thunders of applause.

This, then, was the play. The acting was capital, the music (by Mr. Leonard Butler) was pleasing and comprised many delightful airs ("Sleep" and "Listen, my Darling," being especially good), and the mounting and dresses were admirable. The latter were supplied by Messrs. C. and W. May, of Garrick Street. Altogether the play was highly successful, and the large audiences who witnessed it were quite delighted and heartily endorsed the few sentences of warm appreciation and thanks to the performers spoken by Mr. G. H. Fellowes Prynne, the President, at the close of the performance. Altogether the production reflects great credit on all concerned, especially when it is remembered that they are all amateurs.

A new Public Library at Falkirk is to be built at an estimated cost of between £4,500 and £5,000 from the designs (selected in competition) of Messrs. McArthur and Watson, architects, of Edinburgh. The building will be two storeys high, and will comprise a reading room 51ft. 6in. by 29ft., a lending library 39ft. by 37ft., a reference library 25ft. by 20ft., a recreation room 50ft. by 39ft., and the usual staff accommodation.

Correspondence.

Ordained Surveyors.

To the Editor of THE BUILDERS' JOURNAL.
LONDON W.

SIR,—In reply to your correspondent's query (see page 254 of last week's issue), "ordained" simply means "ordered." In the case of an ordained surveyor, the applicant after having satisfied an examining body as to his professional qualifications is "ordained" or "invested" in his office by the Sheriff of the Lothians and Peebles, or by the Lord Provost, Magistrates and Council of Edinburgh. There is in Edinburgh "The Society of Ordained Surveyors," who have lately instituted examinations which it is necessary for candidates for membership with some exceptions to pass, and which consists of a preliminary and a final. Full particulars and syllabus of the examinations may be obtained from the Secretary to the Board, 56, Queen Street, Edinburgh.—Yours faithfully,

C. MCARTHUR BUTLER.
Secretary, Society of Architects.

Norman Tower at Canterbury Cathedral.

To the Editor of THE BUILDERS' JOURNAL.
HIGHGATE, N.W.

SIR,—I know nothing of the facts of the demolition of the old tower at Canterbury Cathedral, and I am amazed to read the statements in your issue of April 25th that the late Mr. Austin, the cathedral architect, and also the dean and chapter of the day, wishing to re-erect another tower were guilty of a subterfuge. While I can regret the loss of an interesting relic, I really cannot understand the statements which seem to me almost incredible.—Yours faithfully,

HARRY SIRR.

SIR,—In reply to Mr. Harry Sirr's query as to the correctness of my statements about the demolition of the Norman Tower at Canterbury Cathedral, he can rely upon the facts being as stated. I enquired into the matter when at Canterbury some years since, and found the incredible to be credibly narrated. In fact so certain am I of the accuracy of this story that I have placed it upon more permanent record in the pages of my book on "The Dover Road." CHARLES G. HARPER.

"Mitchell's Building Construction."

To the Editor of THE BUILDERS' JOURNAL.
THORNTON HEATH.

SIR,—I have been greatly interested in reading the criticisms appearing from time to time in your valuable journal, especially those with reference to "Mitchell's Building Construction," a book which I myself have studied most carefully, so that I am therefore entitled to an opinion. It seems to me that your reviewer (see p. 155 of issue for April 4th last) has gone through the book in a manner similar to that which a good many people go through a novel, reading the interesting parts and skipping what does not appeal to him, or he would not have left the impression that the whys and wherefores were not explained; besides, his views on the methods of education are somewhat idealistic, and I fear would require more time to carry out than can be devoted to study in these days. Firstly, with reference to the colours. Mr. Mitchell does not state that those mentioned and no others must be used, but gave them as a guide to elementary students who may know nothing of the subject as a basis from which they may select, and whilst not claiming that they will give the most harmonious combinations they certainly make the various materials distinct, which in a working drawing is more important than harmony. Secondly, complaint is made of some of the illustrations on the ground that they might lead a student to suppose that any deviation from the method shown would be wrong. I can only say that I was never the victim of any such supposition. There are, on the other hand, hundreds of well-drawn, fully-figured details representing, as far as my experience (now fairly long) is concerned, types of up-to-date construction, and as such most useful to a beginner.

The references to the illustrations are written in clear terms, without ambiguity or any useless redundancy of words, which your reviewer seems to regret; the point about the brick footings specially mentioned is fully answered with methods of calculation and principles involved in the advanced course on the same subject, a part of the work to which your reviewer seems to have completely omitted to refer. It is a strange proceeding, surely, to review as a principle what is practically an introduction to another work. But, apart from this, the why and wherefore is stated in nine-tenths of the articles, and where this is not done it would seem that, being of an advanced nature, it has been left for the advanced work.

Your correspondent "F. F." (see page 226 of issue for May 2nd) has evidently a grievance against text books generally, and would seem to advise the abolition of all such useless aids. He should remember that we are not all possessed of that intuitive genius, that sagacious penetration, which would lead us to decide with unerring judgment the good from the bad that come under our notice, and that to ordinary mortals, of which class I am a humble member, a book of reference is sometimes a blessing.

I noticed some time ago in your journal a note of two students who gained the first two places in the kingdom in the South Kensington examination in building construction, apparently written by one of them, in which the help obtained from the above book is gratefully acknowledged. This would seem to me valuable evidence of the value of this particular work.—Yours faithfully,

PERICLES.

Civil Service Appointments.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A great deal of misunderstanding seems to exist regarding Government situations for young architects and engineers, which are frequently advertised in the technical journals. I now wish to clearly point out the conditions under which candidates must serve, so that they may look before they leap.

The four departments for which your younger readers are eligible are: The Admiralty Works Department, the Royal Engineer Department, the English Office of Works, and the Irish Board of Works. The salaries of these vary from £150 to £700 a year, and the limits of age from twenty-one to thirty. The conditions of service are governed by the Superannuation Acts of 1859, 1871, 1876, and 1887, and the principal points to be remembered are:—(1) No pension can be obtained until sixty, unless the civil servant is compelled to prematurely retire by injury or ill-health occasioned in the discharge of his public duty. If he leaves of his own free will when under sixty years of age he gets nothing. The mind must therefore be disabused of the popular idea that a Government official can get a pension any time he chooses to give up his post. Not a bit; the Government is by no means so philanthropic as it is supposed to be. (2) No pension can exceed two-thirds of the salary at the time of retirement, and the maximum pension is only attained after forty years' service. Under this period it is one-sixtieth of salary for every year's service. (3) A civil servant must retire at 65. (4) All upper posts can be abolished at one fell sweep, and the Treasury only undertakes to maintain unaltered the pay of the particular class to which the civil servant, for the time being, belongs. Promotion can therefore be peremptorily blocked for good, and the official has no redress whatever. (5) Any office can be abolished altogether, in which case the holder may have a special superannuation allowance, or a gratuity. (6) Service in unhealthy places abroad counts as time and a half. (7) Promotion is not by merit, as advertised, but purely by sequence. The man who gets in first will always be above the man who gets in second, and so on. Such a system is destructive of all zeal, and there is not the slightest incentive to efficiency.

Now for the peculiarities of each department.

In the Admiralty Works Department the civil engineers find three Royal Engineer officers over them, occupying the highest billets at salaries of £700 a year and more, plus their military pay. The civil engineers are thus ousted from the best posts in their own department by the cuckoo Royal Engineers, who merely superintend. The civil engineers are changed about from dockyard to dockyard, and have to go abroad to such stations as Halifax, Vancouver Island, Bermuda, Jamaica, &c. Their whole expenses for travelling are, however, paid. Owing to the recent reorganisation of this department it is now filled with young men who block the way for newcomers, and thus promotion is extremely slow.

The Royal Engineer Department is notoriously rotten to the core, and it has an evil reputation, which it only too richly deserves. Its whole creed is that the Royal Engineers must get the credit for everything, and their selfish interests are far above those of the Army or of the State. Hence the civilians who bolster them up are placed in the background, and the eyes of the public are blinded. There are no advantages in this department beyond free medical attendance, all the rest being disadvantages. Firstly, the social position is intolerable, as the surveyor, being without a commission, is practically treated as a subordinate, and is seldom recognised by other officers of the Army. His so-called relative rank is a farce, and only equivalent to that of a quartermaster, as if forsooth he had enlisted. Such insults make one's blood boil with indignation. Secondly, the pay is wretched, and because of the upper posts being filled with young men advancement is deathly slow. So stationary is it, indeed, that any person now entering will have to wait thirty years before he reaches the princely salary of £300 a year! This is a fact. He starts at £180, and rises by £10 per annum till he arrives at £280, then he waits—and waits—and waits. Thirdly, he has to go on foreign service at least twice, for four or six years each time. Fourthly, the work is disagreeable; all red tape and correspondence, his duties being really those of a quantity surveyor. Fifthly, he is eternally superintended by Royal Engineer officers, who, being jealous of his professional knowledge, do their best to keep him down. Sixthly, and worst of all, if he is a married man it costs him £80 out of pocket every time he gets a move, which may be reckoned on an average every four years. This means a corresponding reduction of income. A special committee recently sat on the grievances of these unfortunate surveyors, but its recommendations were ignored by the Treasury, and the whole of the proposals collapsed.

In the English Office of Works promotion is likewise very lagging, and the salary only starts at £150 per annum. It used to begin at £100, until three of the younger men left in succession and passed into another department, when a generous Home Secretary actually raised it to £150 for future aspirants, but allowed the salaries of the existing officials to remain as they were. Consequently men who had been some years in the service found themselves with less pay than the novices just entered. How beautiful is official justice! Then these architects, or surveyors as they are called, sometimes have to undertake the most gigantic responsibilities, such as taking charge of mops and brooms! They have, however, nice stations, such as London, Edinburgh, &c., where they can live in peace for years without being moved, just because they happen to put in four or five years in one place like the migratory surveyors, R.E. But they also have to serve in China, Japan, and other places in the East.

The Irish Board of Works ends the story of this pitiful black list. Once the examination is passed, political influence holds sway, and he who swears he is a Home Ruler is perhaps passed over the head of the mere Orangeman. Promotion is as tedious as that in other departments, and for similar reasons, and the upper appointments are quite disproportionate to the lower ones. Private practice is strictly prohibited, and one is banished to such remote

spots as Cavan, Galway, &c., there to vegetate as green as the Emerald Isle itself. Then the work is very hard, and the surveyors frequently have to sit up to eleven o'clock at night wading through piles of papers and correspondence generated by a beneficent officialdom. Sometimes men break down from sheer stress, and then they have to go with a miserable gratuity. This department is quite undermanned.

I have personal friends in all these branches, and that is why I know them so intimately. As a man cannot get a pension till sixty, and must retire at sixty-five, it will be seen that the retiring allowance is only a delusion and a fraud, as he cannot live long to enjoy it. The salaries are small, and far below those of even the moderately successful practitioner. The sole advantage of a Government appointment for a technical man is security of employment. Civil Service berths are excellent for mere clerks who cannot do half so well in civil life, but for fully-trained professional men they are no attraction whatever. One can do far better outside, in spite of competition. The wonder is that any candidates come forward at all; but then they do not know. Anyhow, there will be very few examinations for a long time, as the establishments are filled up with young men. I have lifted the veil, and called a spade a spade. My advice—my honest advice—to every young architect or engineer contemplating such appointments is—don't.—Yours, &c.,

CAUGHT.

Railway Charges for Builders' Materials, &c.—I.

By N. L.

MOST builders receive or forward a considerable amount of different classes of goods by rail, and a few remarks by a practical man who has been engaged both in the building trade and the railway service will doubtless be useful.

The common practice among builders is to pay any charge for carriage without question, never taking the trouble to enquire how the charges are arrived at, whatever the amount, when the expenditure of a very little time and trouble will enable anyone to check the charges made, and also to know the cheapest way to forward different goods, when considerable amounts may often be saved. The reasons for this laxity are many, but I will endeavour in this and the following article to give hints and directions on matters in which builders generally make mistakes, and I am sure they will find that, when only a small quantity of goods is sent or received, it will pay them well for their trouble, while if the quantity is considerable they will reap a corresponding advantage.

System of Charging.

As the class of goods dealt with by builders is of a heavy description, we need not trouble ourselves by going into the rates by passenger train, and can confine ourselves entirely to the rates by goods train. Merchandise is classified into eight different classes—A, B, C, 1, 2, 3, 4, and 5—according to the value of the goods, the bulk in proportion to weight, and liability to damage, &c. Classes A and B are only applicable to consignments of four tons and upwards, and Class C to consignments of two tons and upwards; they do not include collection or delivery. Classes 1 to 5 include collection and delivery by the railway company in towns where such service is performed by them, and if the builder should do his own carting to and from the station he is entitled to a cartage allowance of 1s. 4d. to 2s. 6d. per ton, according to the class the goods are rated at; but, of course, this must be claimed or it will not be obtained. How many builders have carted their joinery, &c., to the station for jobs away from home and never known they were entitled to a cartage allowance? The rates of a few of the smaller companies do not include collection or delivery for traffic passing between two of

their own stations, but would do so if going to or from a station on another company's line where such service was performed.

At every goods station a public rate book is kept, accessible to the public by Act of Parliament, and where every rate in force from that station must be entered. Every builder who desires to check his charges should obtain the class rates (and any exceptional rates for goods he is likely to deal in) to those places he is generally receiving from or forwarding to, and keep them handy for reference, so that when any fresh job away from home has been obtained it is only a matter of a very few minutes to obtain the rates to that place.

For small consignments under 3cwt. a special scale of charges is used which is above the actual working out at the tonnage rate. For instance, the charge for 2cwt. 2qrs. at 25s. per ton is 3s. 7d., whereas the actual working out is 3s. 1½d., and where there are two or three different classes of goods of small quantity going to or coming from the same place it will be found cheaper to pay for the whole at the highest rate. For instance:—

	cwt.	qrs.	s.	d.	s. d.
8 pieces rain-water pipe (Class 2)	1	2	at 21	8	= 2 0
8 pieces joiners' work (Class 3)	2	2	at 25	0	= 3 7
Keg white lead (Class 1)	1	0	at 16	8	= 1 2
	5	0			6 9

but 5cwt. at the highest rate—namely, 25s. per ton—is only 6s. 3d. Articles of exceptional bulk or length in proportion to weight, such as long ladders, &c., are charged extra, generally a minimum of one ton for each truck used. Although I shall be able to give a very general comprehensive idea in these articles of railway charges as they affect the builder, it is quite impossible to give a tithe of the various tables and classifications, and I should advise anyone wishing to go thoroughly into the question to obtain a "Classification of Goods by Merchandise Trains," a book published by the railway companies, price 1s.; or a "Guide to Railway Charges," a book published by F. Childrens and Co., 4, Duke Street, Charing Cross, London, price 1s. 6d. post free, which has all the necessary tables and classifications, and also builders' goods classified by themselves, which saves wading through all kinds of merchandise to find that required.

Packing.

The rates for some goods vary considerably according to the manner in which they are packed, if they are packed at all, some goods, which will be referred to later, being only accepted for carriage, if unpacked, at owner's risk. Some of the chief instances are beadings and mouldings, gilt, lacquered or varnished, in boxes or protected by boards, Class 3, otherwise Class 5; metal chimney-pieces, packed Class 3, unpacked Class 4; colours and paints in casks, iron drums, or in tins in cases, Class 2, if in cans, hampers, boxes, or iron bottles, Class 3; lead piping in cases and casks, Class 1, otherwise Class 2; size in cases and casks, Class 1, otherwise Class 2; stoves, polished or enamelled, packed Class 4, not packed, at owner's risk only, Class 3; varnish in casks or iron drums, Class 2, otherwise Class 3.

The following articles if not properly protected by packing are only accepted for carriage at the owner's risk:—Baths; chimney-pieces; chimney pots; chimney tops of iron or zinc; cisterns and tanks, cast-iron; concrete castings; ornamental fencing, cast-iron; figures, casts and ornaments; window frames, iron; grates, ranges or stoves, polished or enamelled; gas and oil stoves; lavatory stands and basins; lead lights; limestone, marble and slate slabs; palisades, iron; pans, earthenware, closet, bath, urinal and lavatory; and window sashes, glazed.

Owner's Risks.

From 10 to 20 per cent. on certain classes of goods can be saved if the consignor forwards the goods at the owner's risk, but an indispensable condition of these reduced rates being charged is that an owner's risk consignment note must be signed by the sender, relieving the company of the ordinary risks of a carrier, but not from any damage arising from wilful misconduct on the part of their servants, &c. The articles that may be sent at these reduced

rates are divided into three divisions, according to their liability to damage—Div. *x*, about 10 p.c. off; Div. *y*, about 15 p.c. off; and Div. *z*, about 20 p.c. off—but care should be taken that a check is kept, to make certain that when the "owner's risk" note is signed the reduced rate is obtained, or the sender may possibly sign the note without obtaining any corresponding advantage. The following are lists of the principal goods for builders subject to the reduced rates, the figures in brackets denoting the class rates:—Division *y*: Eaves, troughs, channels, rain-water pipes and connections, cast-iron (2); flint, plate, sheet and window glass (3); gravestones and tombstones (3 and 4); joiners' work, common wood, including beadings and mouldings (not gilt, lacquered or varnished), doors and frames, fittings and fixtures for buildings, staircases, balusters and handrails, window sashes, frames and shutters (3); lead piping, not packed (2); marble, packed (3); marble slabs, not less than four cemented together (3); marble scantle, 2in. and more in thickness (2); carved stone for the interior of buildings (4); stoves, grates or ranges, common or kitchen (2); lead lights (4); water-closet seats, mahogany (4). Division *x*: Carved stone for building purposes (2). Division *z*: Marble chimney-pieces, packed (3); slate chimney-pieces, enamelled or polished, packed (3); stoves, polished or enamelled, packed (4); mantelpieces and overmantels, wood, in cases (5).

In the event of certain goods getting broken or damaged when being carried at owner's risk, the railway companies will return the damaged article and carry another similar one to replace it free of charge, provided that the damaged article be returned within two weeks of being tendered to consignee, and the whole transaction is completed within one month. The goods which may be thus treated are baths, balusters and palisades, iron or steel; boilers, kitchen or furnace, iron or steel; cisterns, cast-iron; window frames, iron; grates, ranges or stoves, common, kitchen, polished or enamelled, packed or otherwise; lamp-posts, iron or steel; light iron castings; ovens, common or kitchen; overmantels, cast-iron; eaves, channels, rain water pipes and connections; pipes, iron or steel; sinks, cast-iron; slate slabs, plain or enamelled; stable fittings, iron or steel; stoves, gas or oil; tables, cast-iron or cast-steel; and valves, gas or water.

(To be concluded.)

Builders' Notes.

Breach of Building By-laws at Lancaster.—At the Lancaster Borough Police Court recently four informations were heard against John Gibson for non-compliance with the local by-laws in erecting four houses in Aberdeen Road, Lancaster, in March, 1899. It appears that plans for these houses were deposited and approved, then an amended plan was submitted and disapproved, and eventually the houses were erected not in accordance with either of these plans. The magistrates imposed penalties and costs amounting in all to £10 8s.

Malicious Prosecution of a Bricklaying Contractor: Damages £500.—The case of *Holdswoth v. Willsmer* came before Mr. Justice Grantham and a special jury in the Queen's Bench Division on Friday last. It was an action for false imprisonment and malicious prosecution. The plaintiff was a bricklaying contractor of Walthamstow and the defendant was a timber merchant of the same place. The defendant had given the plaintiff a contract to do the bricklaying on some houses at Leyton, and the plaintiff was to provide his own scaffolding. Disputes arose, and the plaintiff sent two men for his scaffolding, and after it had been taken to his yard the defendant brought the police and charged him with stealing some wooden poles. The magistrates at Stratford dismissed the case without calling on the defence for an answer to the charge.—The jury found a verdict for plaintiff for £500, and judgment was given for this amount, less £30 19s. 6d., which had been paid into Court

in connection with a counterclaim for work done.

Slag Bricks and Cement.—At the second sitting of the Spring Meeting of the Iron and Steel Institute of Great Britain on Thursday last (Sir William Roberts-Austen, the president, in the chair), the utilisation of blast-furnace slag was dealt with by the Ritter Cecil von Schwarz, who first referred to its present use in the form of sand and as made into bricks and cement. Hitherto slag cement appears to have been a somewhat untrustworthy article. Recently, however, a process for the manufacture of cement from blast-furnace slag has been started in Germany and Belgium, and the results were stated by the author to be highly satisfactory as regards strength, voluminal constancy, and reliability. In the manufacture of this cement, the slag is first granulated and then reduced to sand, in which condition it is mixed with limestone and slacked lime, the mixture being reduced to a fine powder. This powder is then mixed with water and made into bricks, which are air-dried and afterwards burnt into clinker in a special furnace. The clinker is stored for about six weeks, and is then ground into fine powder. The cement thus produced is said to be distinguished for its exceptional tensile strength and resistance to compression.

More Fire Tests: Important Floor Test.—Publication No. 46 of the British Fire Prevention Committee gives an account of tests made with screen sail curtains by Mr. Rasmus Buggé. One curtain was 8ft. high and the other 8ft. 2in. high; both were 8ft. 6in. wide. The second test was made on account of the climatic conditions being extreme in the first instance, for it was freezing at the time. In each case the curtain was hung directly in front of two door openings (each about 7ft. by 3ft.) with the fire at the back. After a test of half-an-hour the curtain still remained intact, though one or two small holes were made in it. Publication No. 48 of the Committee gives the result of a fire test with a floor of deal joists and coke breeze concrete of the kind specified by local authorities as fire-resisting, and about which there has been considerable controversy in technical circles. The area of the floor was 100ft. super. in the clear (10ft. square), and the load was 100lbs. per foot distributed, six weeks (winter) being allowed for drying. The following is a summary of the effect of the test:—In fifteen minutes all the boarding to the soffit was consumed. In fifty-four minutes the flame came through the floor between the last joist and the wall. In sixty minutes the floor had deflected and the concrete had cracked transversely. In seventy-four minutes the concrete between the two east joists fell. In eighty-two minutes the floor and load collapsed. The joists were found broken in the centre and the bottom edge charred about 2in. to 2½in. The floor boards (¾in.) were only slightly injured. The maximum temperature reached was 2,100deg. F.

Enlargement of Wakefield Cathedral.—Mainly through the efforts of the Bishop of Wakefield, the £7,500 which was required in order to claim £2,500 offered towards the Wakefield Cathedral extension has been subscribed. The total sum raised from the beginning is £27,338, and, after paying £8,267 for property, &c., to improve the site, there is about £6,000 still to raise to complete the contracts already entered into, which amount to about £25,100.

Walsall New Municipal Buildings Competition: Result.—In this competition the five selected designs recommended by the assessor (Mr. J. MacVicar Anderson, F.R.I.B.A.) and approved by the Council, are:—(1) Mr. James A. Bowden, architect, Moorgate Station Buildings, 63, Finsbury Pavement, E.C.; (2) Messrs. Cackett and Burns Dick, architects, 24, Grainger Street West, Newcastle-on-Tyne; (3) Mr. Sydney W. Cranfield, A.R.I.B.A., and Mr. H. J. Potter, A.R.I.B.A., 19, Lincoln Inn Fields, W.C.; (4) Mr. J. Glenn Gibson, architect, 4, Gray's Inn Square, W.C.; and (5) Mr. William A. Pite, F.R.I.B.A., and Mr. R. S. Balfour, A.R.I.B.A., 3, Upper Montague Street, Russell Square, W.C.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"All art constantly aspires towards the conditions of music. For while in all other kinds of art it is possible to distinguish the matter from the form, and the understanding can always make this distinction, yet it is the constant effort of art to obliterate it."—W. PATER.

Cretan Archaeology.

EXCAVATIONS were begun in March last by Mr. Arthur Evans, representing the Cretan Exploration Fund, and Mr. D. G. Hogarth, the Director of the British School at Athens, on the site of the ancient Cnossus in Crete. It was here that King Minos built the Labyrinth as a prison for the Minotaur, the monster ultimately slain by Theseus. Mr. Evans has laid bare a large building belonging to the Mycenaean period, which may be dated from 1500 to 1000 B.C. The plan and contents of the building show it to have been a palace like those which Schliemann discovered at Mycenae and Tiryns. In one chamber of the palace there have been found a great quantity of clay tablets bearing inscriptions in the very early "Cretan script," a system of writing much older than the Greek alphabet. Another find of very great interest is a well-preserved fresco painting in one of the corridors of the palace, representing a girl in the usual Mycenaean costume holding a slender vase in her hands. The drawing is good, and the picture will probably take rank even before the Flying-fish fresco found by British excavators in the island of Melos, which was hitherto the finest known example of Mycenaean wall-painting.

The Tall Building.

SINCE the middle of April a series of articles on "American Engineering Competition" have appeared in the pages of the "Times." These have been written by their special correspondent, and show that the writer is thoroughly conversant with his subject and in a position to speak authoritatively. Article No. 8, which appeared in the issue for Thursday last, deals with structural steelwork, and as it is of special interest to our readers we give below some extracts from it. "The big steel buildings of America have been too often written about to make any detailed description of them necessary here; but I doubt if many persons in England have an idea how completely in America steel is taking the place, not only of wood, but of brick and stone. One of these enormous edifices will contain ten to twenty thousand tons of steel and will be twenty to twenty-five storeys high. The framework is erected with marvellous rapidity, very powerful lifting appliances being installed by the contractors for the purpose. As all the parts are prepared accurately to size at the works, with holes drilled, they have only to be fitted together and a few rivets or bolts put in to make the skeleton of the house. . . . It is to be hoped that something more may be done to introduce the steel building into this country, if for no other reason than to give an impetus to the steel trade. If our own steel-makers would take a leaf out of the Carnegie book and do something to force this outlet for their wares, instead of sitting still and lamenting their hard fate, it would be better for themselves and for the country. . . ."

American Engineers.

THE Americans appear to be specialising in quite a different direction to ourselves. We have our great George Street magnates for designing bridges, roofs, &c., and the contractor, in theory, has simply to follow drawings and specifications. In America there are a certain number of designing engineers, but the work is far more in the hands of men who have had wide experience in the execution of work. Therefore, practice and theory—using the terms in their conventional sense—go more often hand in hand. I think the example we had in this country not long since of the design of an important bridge being recast by the contractor's engineer

because it would have been impossible to erect it as originally planned could not occur in America. In Westminster there are civil engineers who will design a whole railway in their office; bridges, station, permanent way, locomotives, carriages—in fact, everything; and ill fares the impertinent contractor who suggests that any detail is capable of improvement. The consequence is that such designs are not designs at all, they are merely copies of former practice—methods and details pieced together to suit the occasion as well as may be; and thus progress is checked and the foreign contractor gets a footing. On the other hand, the British contractor, not being consulted, will not consult. He has to produce exactly what he is told, be it good or bad, and he seeks compensation in producing it in exactly his own way."

The Blackfriars Arches.

A PARTY of antiquarians (including Sir Walter Besant, Mr. W. St. John Hope, and Mr. Wickham Noakes) recently visited the Blackfriars Priory referred to on page 253 of last week's issue. The principal arch, says the "City Press," had been excavated to a considerable depth to allow it to be inspected, and the newly discovered archway had been partly revealed by the knocking away of the brickwork which has covered it. The arch and the half-arch on the north wall measure about 14ft. in length, and the remaining arch on the east wall, at right angles to the other, adds another length of some 11ft., giving a total of 25ft. of the walls of the Blackfriars Priory still remaining. The height of the main arch, which was formerly pierced by a window, is 13ft. from the lowest stonework yet excavated to the apex. An opinion has been expressed by Mr. Gordon Hill that these remains are in no way associated with the Blackfriars, but ante-date the friars' buildings by 100 years, and are, perhaps, relics of a palace. Mr. St. John Hope, however, is of opinion that they are late thirteenth or early fourteenth century work, and, considering that the Blackfriars Priory was commenced about 1276, the probability is that the remains are none other than those of some building of the priory. That it was a vaulted building may be gathered by the spring of an arch which remains. Though the arches are within the priory precinct it cannot be claimed that they have ever formed part of the friars' church, which building was more to the south-west. Great interest has been taken in these ancient remains, and it is gratifying to learn that the main or northern archway is to be carefully taken down, stone for stone, and rebuilt in the grounds of the residence of Mr. Wickham Noakes, at Selsdon Park, Croydon, where the remains will be open to the inspection of those interested on the presentation of a visiting card.

Cast Metal Competition.

AN exhibition was open last Wednesday and Thursday at the Ironmongers' Hall of designs for and work in cast metal submitted in competition for the prizes offered by the Founders' and Ironmongers' Companies. The designs were adjudged by Mr. G. J. Frampton, A.R.A., and Mr. R. H. Young. The collection was a very disappointing one, there being only just over thirty exhibitors. It seems somewhat a pity that more interest has not been aroused in this laudable effort of the Founders' Company to help arts and crafts forward in the branch they are concerned with, and that more works were not sent. On the whole, the examples were of average merit, with perhaps one or two works of considerable merit. The majority of the exhibits were, however, very unimaginative. In Class I. half the first prize in Section A is gained by Mr. H. Charles Eyres for a tobacco box in the shape of a flower, not very well cast and which is of little use for the purpose intended. Mr. Alexander Stokes with a small plaque copy in metal of Raphael's cartoon showing St. Peter healing a man sick with the palsy shares the second prize with Mr. J. Alfred Lemon, who exhibits a portrait medallion casting. Mr. James Ellis in Section B takes third prize with a small rococo casting of a stand and

figure holding a glass mirror. The first prize of £10, Section C, given by the Ironmongers' Company, is awarded to Miss Florence H. Steel for a neat design for a pilaster-panel. The third prize, Section C, is taken by Mr. A. J. Shirley, for a not very original plaster-cast from an embossed copper panel called "The Vanities of Human Life." One £2 10s. prize, Section C, is taken by Mr. Richard Garbe for a bust and head of very ordinary merit, and another £2 10s. prize by Mr. Onslow Whiting with a set of castings of electric bell pushes, switch, bell handle and letter plate, which we seem to remember seeing at the last Arts and Crafts Exhibition. The third prize in Section D is given to Mr. S. S. Dunwell for a simple and neat little bell. In section E half the first prize goes to Mr. Henry Price for a model of a group, and half to Mr. Arthur C. White for a design for a panel; the second prize is gained by Miss Florence H. Steel for a very pleasing plaster design for an alms dish; the £2 prize in this section goes to Miss Eveline M. J. Howell, and the £1 10s. prize to Miss Eliza M. Burgess for two good designs for caskets; the £1 prize goes to Mr. G. Gilbert Walker for a design for a pastoral staff. In Class II. the first prize, Section B, is taken by Mr. George W. Lee for figure heads, one a plaque of no particular use, and the second prize is given for a group of castings by Mr. Frederick B. Robinson. Mr. G. M. Ellwood sends designs for mantels and cast iron railings, but a design for a grille stated to be for cast iron would be almost impossible to carry out in the flimsy foliage forms. Two designs for gates by Mr. Albert Waldron are worthy of notice, but would be slightly too light for outdoor use. The design for a verandah by Mr. R. Quilter Lane is an unsuccessful attempt, for, of course, a design is of no use unless in keeping with the architecture, and a drawing-board design meant to be turned out by the dozen is a quite mistaken ideal.

The Silchester Excavations.

MR. G. E. Fox and Mr. W. H. St. John Hope gave an account at a recent meeting of the Society of Antiquaries of the excavations at Silchester during last year. An account of the work done during 1898 will be found on page 253 of the BUILDERS' JOURNAL for May 31st, 1899. It may be remembered that in 1898 the explorers were at work at the south-west corner of the city; last year they turned their attention to the opposite (or north-east) corner. The two insulae laid bare lie to the north-east of the forum insula, in the centre of the city, and between the modern high road and the north wall. The largest structure discovered last year is a house of the courtyard type at the south-east side of insula 21. Immediately to the south of this is a smaller house, chiefly interesting on account of its having yielded a fragment of mosaic pavement of good design. The pavements of the other houses were either quite plain or merely striped in different colours, so it is to be regretted that the only piece of ornamental mosaic found last year should not be larger. Two other houses (making four altogether) were explored in insula 21, one at the north-west corner of the corridor type, and the other at the north-east corner also of the corridor type, but converted into a courtyard house by later additions. The four corridor houses discovered in insula 22 were of inferior size to those in insula 21, and of no great interest. Some of the houses had hypocausts, but in nothing like so perfect a state of preservation as other examples of this kind of heating apparatus at Silchester. Besides the houses there were a few "blocks," a term used to describe a building of unknown use. The most remarkable feature in the plans of the buildings is the irregular way in which they are placed with regard to the sides of the rectangular insula, suggesting that many of the houses existed on the site before the walls of the fortified city were built, and that the enclosed space was divided up into blocks so perfectly correct in shape as to be worthy of the admiration of the setter-out of an American town. The expenditure on the explorations in 1899 was £515 0s. 7d., and the results obtained are well worth the money.

FIG. 4.—DETAILS FROM THE NAVE OF ST. PAUL'S CRAY.

DETAILS OF SOME KENTISH CHURCHES.

By J. RUSSELL LARKBY.

THERE is, perhaps, no other county in England where the ecclesiastical buildings contain so many remnants of Early English work as the county of Kent. This remark applies more especially to the interior features, as, alas! the restorer has, in a vast number of cases, made his handiwork far too prominent on the exteriors, so that many churches fairly complete inside are, externally, of all styles and of no style. In some cases, too, the re-

FIG. 1.—DETAIL OF LADY CHAPEL ARCH, ST. PAUL'S CRAY.

stor has invaded (and apparently quite overcome) the interiors of many of these interesting old village churches. He appears sometimes as a cheap paperhanger and painter of extraordinary frescoes, whilst at other times he is seen to advantage as the author of styles of architecture never dreamt of by the early masters of the art. Not that restoration, in the true sense of the word, must be

decried; in many cases it is of the first necessity, and can be accomplished (as at St. Paul's Cray, Kent) without utterly destroying the early portions of the building. Nevertheless, every artist and antiquary must for ever tilt at deeds which are perpetrated every day under the cloak of "restoration."

But to return to the subject of the common occurrence of Early English work in Kentish churches, St. Mary Cray, St. Paul's Cray, Orpington, Chelshfield, West Wickham, Eynsford, Farningham, Kensing and Wrotham, to name only a few in West Kent, all contain really good Early English work. It is true that Early English windows are very uncommon, and in the churches above mentioned the work is chiefly confined to chancels, nave arches, and doorways. At Eynsford, however, there are nine lancets in the transept, but the work in other parts of the country would be accounted plain, and of little value. Good Early English or other towers are also very rare in Kent, and, indeed, the churches have nothing to compare to the often superb towers of the west country.

The most interesting building in West Kent, having reference to Early English work alone, is the small church of St. Paul at St. Paul's Cray, situated in the by no means sweet-smelling valley of the Cray river—a stream of chameleon-like qualities and constantly decreasing volume. By referring to Fig. 1, the very good character of Early English foliage of an uncommon order will be at once apparent. This sketch is taken from an arch leading to the Lady Chapel, which now does duty as a vestry. The most prominent feature of the foliage is the volute-like object on the central shaft, and its form in this instance does strongly support the contention that Early English foliage was, to a great extent, influenced by the Ionic volute. A curious and unusual combination of foliage with the human head is illustrated on the left hand shaft; but it is, of course, possible that this portion is of later date and not contemporary with the other parts of the capitals. Unfortunately, there is here little to judge from, as the foliage has been greatly damaged.

Fig. 2 is taken from the first bay of the nave, and illustrates the very common arrangement of a small shaft in a plain chamfer; but I cannot at present call to mind any other instance in West Kent where the capitals of the shafts are replaced by human heads. The

central head on the half column is vigorously rendered in the original. Fig. 3, which is a south elevation of Fig. 2, is interesting on account of the well-formed oak leaves and the graceful termination to the hood mould. At Fig. 4 we find the most interesting piece of

FIG. 2.—FIRST BAY OF NAVE, ST. PAUL'S CRAY.

work in the church. The details here drawn are attached to the reversed bell of an otherwise very plain capital. It will be noticed that the third head from the left is similar in style to the head exhibited on many of the coins issued in England during the latter part of the twelfth century.

In the chancel of the church is a small acutely-pointed arch with well-moulded capitals and bases to the columns, and the moulding is very similar to that on some of the smaller capitals in Westminster Abbey. It gives that good effect of light and shade so characteristic of Early English work.

FIG. 3.—FIRST BAY OF NAVE, ST. PAUL'S CRAY.

FIG. 5.—FONT, EYNSFORD.

FIG. 6.—CORBELS, EYNSFORD AND ORPINGTON.

The font illustrated at Fig. 5 is from Eynsford Church. The building itself is of considerable interest, as it is one of the few Kentish churches with the apsidal chancel. The font probably dates from the middle of the sixteenth century; above the sketch are shown the shields attached to the other facets. Fig. 6 shows some interesting corbels from Eynsford and Orpington. Nos. 1 and 3 are from the north aisle of Eynsford Church, and No. 2 is from the west wall of the same building. The expression in this example is excellent, and it is treated in the free style quite worthy of the Decorated period at its best. Nos. 4 and 5 are from Orpington, and are of middle Perpendicular date. The arms shown on No. 4 are again repeated on a dripstone termination above a four-light Perpendicular window in the chancel, which has the

FIG. 13.

depressed arch and stiff tracery of that period. An interesting example of Early English work at the beginning of the style can be seen in the chancel of Orpington Church. It is a small, round-headed priests' door, with a plain chamfer, in which is placed a bold round continued down to the ground line.

Chelsfield Church.

Lying a short distance from the main road, and in a position of great beauty, Chelsfield

pierced by two Early English lancets with very wide splays, but without mouldings, and although they may be early in the style it is impossible to give even an approximate date to them. Examining the external base of the tower another example of early wide-jointed masonry is to be seen, and from this it appears probable that the original dimensions of the church have not been extended, notwithstanding the alterations made at times subsequent to its erection. This is certainly supported by reference to Fig. 9, which shows two Norman windows, and a Decorated doorway at the west end.

Fig. 10 shows a Decorated capital and base from the arches leading to the south chapel. The capital is a good example of the application of roll moulding; the arches above are quite plain, being merely chamfered off at the angles. They appear to have taken the place of some earlier work, as the chapel has a small and deeply-splayed Early English window in its south wall. That the chapel was not included in the original design of the church is, I think, shown by the presence of a small round-headed Norman window above the Decorated arches, now filled up and the access of light stopped by the lean-to roof. The masonry of the chapel, it should be stated, is composed of ordinary flints, the same material as used in the other Early English portions of the structure.

Fig. 11 shows the east window details. The east window of this church is a fine composition of three Early English lancets, plain and separate without, but splayed within, having banded shafts with well-moulded

FIG. 9.—NAVE, CHELSFIELD.

but here with the work of our own forefathers—!

Fig. 12 shows the only old woodwork in the church, if we except a very much restored screen in the tower arch. The work sketched is perhaps not beautiful, but in a district where old woodwork is uncommon one must be thankful for small mercies. Fig. 13 illustrates a squint from the sometime Lady Chapel bearing on the High Altar. It is apparently of middle Perpendicular date, and cuts the wall at a very oblique angle. The great length in proportion to the breadth is to be accounted for by the level of the chapel floor, which is considerably lower than the chancel level. The levels do not appear

FIG. 12.—WOODWORK IN CHANCEL, CHELSFIELD.

Church is a building of no less interest to the architectural student than to the ecclesiologist, whether he be amateur or professional. To the latter, of course, the building and its humble, but interesting features will appeal in a peculiar manner, whilst the former will find ample food for reflection, for it is not often that one finds in a small country church very good, though plain, work of three distinct periods—Late Norman, Early English, and Decorated. For a short excursion, say, Saturday afternoon, I know of no other place in the district where one can so easily spend a few hours with genuine pleasure and profit. The church is dedicated to St. Martin (Bishop of Tours, A.D. 473), and in order to give a general idea of the structure it is only necessary to say that it consists of chancel, nave, with south chapel and porch, and a north tower with the broach spire so common in the county.

The earliest portion of the church would appear to be a small area of the north wall of the nave at its junction with the tower, and this consists of wide-jointed masonry which still retains a deeply-splayed Norman window, the details of which will be seen by referring to Fig. 7. The junction of the Norman with the Later Decorated work can be plainly seen outside, but the inner surface of the wall is covered with plaster and white-wash. The tower arch (Fig. 8), which is really a continuation of the nave wall, is also of Norman date, and fortunately it has so far escaped restoration. As the arch is acutely pointed without any apparent necessity for it, the work must be of rather a late date, getting near to Transition, but the character of the abacus, and the plain base without mouldings or plinth, at once stamp the work as Norman, without much later influence. The lower portion of the tower is

capitals and bases. The square abacus of the capital, as shown in the section, is peculiar, but this of course may be a restoration. It is impossible to say if this is so, or not as the work is covered with modern paint, and if the paint were used as a device to conceal the chief beauty of the work one can only say that it has been entirely successful. It will be a happy day when people learn that Early English work looks really well without paint and varnish. One can imagine the howl of indignation from all classes if the County Council ordered that the alien "Cleopatra's" needle should be given a coat of white paint, with the details picked out in red and blue,

to have been altered at any time subsequent to the piercing of the wall to form the squint. There are some very fair brasses in the chancel; one, a priest brass (name not given) on the chancel wall, being of excellent workmanship. Another in the chancel floor, bearing date 1420, has a scroll issuing from the right shoulder bearing the application, "Jhu fili dei miserere mei." The chasuble worn by this priest is of great length and reaches nearly to the bottom of the alb. Near the squint is another very interesting but mutilated brass to Robert le Brun (Fig. 14). It is, or rather was, a representation of the Crucifixion, but the central figure and the figure of

FIG. 10.—DECORATED CAP AND BASE, CHELSFIELD.

FIG. 11.—DETAIL OF EAST WINDOW, CHELSFIELD.

St. John have both disappeared, whilst the figure of St. Mary, strange to relate, with the exception of the head, is nearly perfect. Judging from the style of what is left of this brass, it was at one time a work of considerable beauty; hence probably its present deplorable condition. The chief object of attack has naturally been the crucifix, the matrix of

FIG. 14.—CHANCELL BRASS, CHELSFIELD.

which has been very roughly handled. On the face of the tomb is the inscription: " + Hic jacet Robert-le-Brun quonda Rector istius ecclie qui obyt XXV d'e meus Aprilis annodui M^oCCCC^o XVII^o cuj aia ppiciet de Amc. + "

ARCHITECTURAL ASSOCIATION.

EGYPTIAN TEMPLES.

By ALEXANDER PAYNE, F.R.I.B.A.

A MEETING of this Association took place last Friday evening, Mr. G. H. Fellowes Prynn being in the chair. The minutes having been read and confirmed and a vote of thanks having been accorded to the ladies and gentlemen who assisted at the soirée, Mr. Payne then read his paper on "Egyptian Temples," of which the following is a summary:

I think I may say without fear of contradiction that in studying the temples of Egypt we are studying the earliest monuments that exist devoted to religion and erected by what was the most civilised nation of the ancient world.

There is evidence to show that most of the religions of the ancient world were derived from a common origin, and had for their main idea either the worship of the powers of nature or as regarding nature as a theatre descriptive of divine things. In Egypt it is certain from the monuments themselves and the representations on them that their early worship was derived from the phenomena of nature, and fortunately we have from Egyptian hieroglyphics a full description of what took place in each room of the temples, where staircases are provided leading up to the flat roofs, so that certain ceremonies might take place in full view of the heavenly bodies in honour of which the services are held.

When the Greeks and Romans successively conquered Egypt and made it a province of their empires no attempt was made to disturb their worship and religion, so similar in some respects to their own; in fact, the Egyptian deities were at once adopted as part of the State religion, and vast sums were spent in the restoration of the ancient temples evidently under the direction of the Egyptian priesthood, and, judging from the inscriptions, with the most scrupulous conservatism of the ancient plan and purpose.

Memphis.

Abydos has been called the cradle of Egypt, but the seat of the first settled monarchy appears to have been the great city of Memphis, just south of modern Cairo, and said to have been founded by Menes, the first historic king, about 4000 B.C. This city must have been one of the largest of the ancient world, and the ruins of an immense place remained as late as the twelfth century A.D.; but, owing to the inundations of the Nile, nothing remains of it at the present day but a few earth-mounds and two colossal statues, which stood in front of the great Temple of Ptah, and the Pyramids and innumerable tombs built on the uplands west of the Nile, which formed the great cemetery of the city, and amongst which the famed Pyramids of Gizeh formed the chief. These are surrounded by whole streets of tombs.

The inundations of the Nile have also destroyed almost every vestige of the large cities which once existed in the Delta, so that it is necessary to go 200 or 300 miles up the Nile before reaching extensive remains of temples. The whole valley of the Nile, including the river itself, would appear to have risen since the times of ancient Egypt, so that the Temples of Denderah and Edfu, which will be described in detail, are now some 30ft. or 40ft. below the level of the ground, and have had to be dug out quite recently for their complete examination, and are now under the care of the Government as ancient monuments. There are also extensive remains at Kom Om-bos, Esneh, Philæ, and other places on the river. It is at ancient Thebes that an idea of the magnificence of ancient Egypt can be best obtained. The ruins of temples and buildings there exceed those left in the remainder of Egypt altogether, if we except the Pyramids, and are far more extensive than anything remaining either at Rome or Athens. The site of the ancient city, being mostly above the level of the inundation, has escaped the destruction that has fallen upon other cities. Thebes dates from a high antiquity, and a few of the more ancient parts of its temples are from the time of the Eleventh Dynasty, about 2500 B.C.; but under the Pharaohs of the Nineteenth Dynasty (about 1400 B.C.), Seti I. and Rameses II., &c., the chief seat of government was transferred from Memphis to Thebes and the city was embellished with the magnificent temples of which the ruins now remain. The great group of Karnac alone is nearly a mile long and one-third of a mile wide, and comprises a whole assemblage of temples connected together by avenues of sphinxes. These buildings are mostly far too complicated and elaborate to describe in the limits of a single paper. Moreover, they show in many instances a departure from the original and simple plan of the early temples dedicated to the gods; the monarchs of this period would seem to have been almost intoxicated by the grandeur of the empire and the extent of its foreign conquests, and the temples are covered with inscriptions of their own glorious doings, and, though the credit of them is all ascribed to the gods, the prevailing sentiment seems their own glorification.

Egyptian Cosmogony.

The Egyptians imagined the world to be a vast plain suspended in space, of which Egypt, with the Nile running through it, was the centre and by far the most important part, the nations round being comparatively barbarous and uncultivated. Below this plain was stretched out the plain of the nether world, with another Egypt and Nile almost the counterpart of those in this world; the sun and moon and heavenly bodies, after traversing above the world, descended in the west and passed back again over the plain of the nether world, rising again in the east. All the spirits of the departed went to the nether world, and those that were judged worthy of continuing life remained there with the same avocations and amusements that had occupied them in this world.

It is at Denderah before we come to any considerable remains of a temple. This temple, as it actually stands, was rebuilt in the time of the Ptolemies, and the decorations were continued down to the time of the Roman Emperors, but the inscriptions show that it was a restoration of an older temple which stood at the same place from the very earliest times. One inscription says: "The great building plan of Ant (Denderah) was found written in ancient characters on hide of the times of the successors of Horus." Another inscription says that King Totmes III. made a restoration of this monument found described in ancient characters of the time of King Khufu (the builder of the Great Pyramid of Gizeh). Thus it appears that the Egyptians regarded themselves as the keepers of the sacred plans of the religious buildings, which were handed down by writing and tradition from the most ancient times and were not deviated from in any essential particular; we may, therefore, regard them as models of the ancient temples which existed from the earliest time, and it is

interesting to notice many features in common between them and the Tabernacle erected by Moses by divine command and the temples of Ezekiel and Herod, and also the temples of the Greeks and Romans; there is as much similarity in the plan and arrangement of the great temples of Egypt as there is between the different cathedrals of the Christian Church. This temple of Denderah was dedicated to Hathor.

Egyptian Mythology.

Egyptian mythology is complicated by the fact that in various localities different names are applied to the same idea. The fundamental principal seems to have been to regard the heavenly bodies and powers of nature as symbols of the attributes of the Deity, and in most localities there is a divine Trinity. First, there is the masculine or creative principle symbolised by the sun, and called Ra-Harmachis at Heliopolis, Amen-Ra at Thebes, and so on; and in the philosophical idea representing the powers of goodness and light as opposed to evil and darkness. Secondly, there is the feminine or receptive and maternal principle symbolised by the moon and stars, and called Isis, Hathor, Muth, and several other names; and in the philosophical idea representing truth and faith, which keep alive and preserve the powers of goodness in states of decline symbolised by the night. Finally, as the result of a marriage or union between these two, there follows the third principle, the new-born day, represented by the sun rising again and called Horus; and in the philosophical idea representing the resurrection and regeneration, and the dawn of a new era of religion and civilisation in the world. The ceremonies and processions which took place in the temples would appear to have been theatrical representations of what takes place in nature; each hour and day being symbolised as a separate deity, and the great event being the triumph of the sun over the powers of darkness and its bursting forth in renewed splendour at the opening of day.

There was probably an entrance court before the Temple of Hathor at Denderah but if so it has been destroyed, and now one enters directly into a hall or porch supported by twenty-four columns; this is the Hypostyle Hall or Khent Hall—that is Front Room. It is 143ft. broad, 80ft. deep, and about 50ft. high; it is a most noble apartment of harmonious proportions, and at once strikes the beholder with its grandeur; the walls are decorated with reliefs recording the various Pharaohs who built or restored the temple. The ceiling represents the firmament and stars.

Passing through this room, with its beautiful and massive columns covered with inscriptions, we proceed along the central axis of the temple into the Hall of the Appearance, so called because the statue of Hathor, "the golden-rayed," was brought on festive occasions from the Holy of Holies in the rear into this hall to be exhibited to the people, who did not advance beyond the front room; this room is 45ft. 6in. square, and the ceiling is supported by six columns.

There were three small rooms on each side of the Hall of Appearance; one of those on the left side was the temple laboratory, where the incense, oils and ointments were prepared for the temple services, as the inscriptions thereon show. The second room is called the assembly-room, and it is supposed the offerings were placed here on the festal days. The third room afforded a passage out of the temple. One room on the right, or west side, was called the Silver-room, and contained the jewels and ornaments of the divine image and temple utensils of costly materials, as shown in the inscription, which gives the uses of the room. The second room formed an exit from the temple on that side; the third room formed a sort of anteroom to the stair leading to the roof on that side.

Following the main axis of the temple, the next room is called the Hall of the Altar, immediately behind the Hall of the Appearance. On the left from this a small anteroom leads to a long straight staircase ascending to the roof. There is also a room on this side called the Room of Purification, probably used in the

preparation of festival ceremonies. On the other side is another staircase, of short flights, winding round a square with landings at the angles and ascending to the roof; the inscriptions on these rooms and staircases refer to the great New Year's Festival, on which occasion there was a solemn procession of the priests carrying images of the deity through the temple and afterwards to the roof. On the roof is a small temple, from which the rising sun or the moon and the stars could be seen, and which presumably formed the goal of the procession before proceeding down the other staircase. The next room in the centre of the temple axis behind the Hall of the Altar is called the "Hall of the Cycle of the gods," or the "Middle Hall," and this is immediately in front of the cellar, adytum, or Holy of Holies. This sanctuary is surrounded by a passage round which are a series of small rooms used in the services of the temple.

Next to the dwelling of Hathor is "the Chamber of Flames," where the goddess is represented exterminating evil with fire; the next is called the "Throne Room of Ra"—the Sun—where the Pharaoh (who represented the deity on earth) is shown destroying a crocodile (evil) with his lance. On the west side are the "Rooms of Purification" and "the Room of a Necklace," where the king is shown presenting a necklace to Hathor. In the thickness of the walls of the temple are twelve crypts or secret chambers, in which, it is supposed, the treasures were kept, and the entrances to which were ingeniously concealed. On the roof were six rooms, three on the east and three on the west side, devoted to the worship of the slain and risen Osiris, as shown by the inscriptions.

I have passed by Abydos, where there are interesting mortuary buildings with some of the most beautiful sculptures of Egypt, dating from the time of Seti I.; and shortly above Denderah we come to Thebes, with the great temples of Karnac and Luxor. It is quite impossible in the limits of one evening to describe these in detail.

Almost all the temples on the west bank of the river were mortuary buildings, the west or setting sun being devoted to the dead.

Esneh.

We next make a stop at Esneh, 484 miles above Cairo, where are the remains of the Hypostyle, or front room, corresponding with the similar apartment already described for Denderah; it is a very noble specimen, in excellent preservation. The size of the hall is 103ft. by 52½ft., and is supported by twenty-four columns 37ft. high. There are high abaci over the capitals of the columns, on which rest the massive architraves, and again on these the roofing blocks, each block varying from 22ft. to 26ft. long and 6ft. 6in. wide. It is calculated that there are 110,000 cubic feet of sandstone in this hall alone, and the whole of the interior is covered with inscriptions. According to these the hall was founded not later than Totmes III. (Eighteenth Dynasty) and afterwards rebuilt by the Ptolemies; it was dedicated to the ram-headed Khum-Ra, one of the representatives of the sun god, and signifying the union between the rising and setting sun.

The hall is remarkable for the great beauty of the capitals of its columns, which differ from one another but are not discordant; the sculptor has derived his inspiration from the lotus, palm, and other foliage.

Edfu.

A few miles above Esneh is Edfu, a little village in which stands the most complete specimen extant of an ancient Egyptian temple. The plan is almost the same as that at Denderah, with the addition of a large court surrounded by a colonnade in front of the temple, entered by a huge pylon or gateway, with two pyramidically-shaped massive towers, which originally formed the main entrance to all Egyptian temples. There is also a girdle or encircling wall going round the whole temple and forming an outer protection, which probably originally existed round most Egyptian temples. The pylons in front, or "watch towers" as they are called in the inscriptions, are 100ft.

high; an easy staircase surrounded with good hewn stone in large blocks in the pylon ascends to the summit, from which a magnificent view of the winding Nile is obtained. In front of the pylons are four vertical deep niches, in which were placed the higher flagstaffs, covered with copper, as the inscriptions tell us, "to avert the storms of heaven"—in other words, they acted as lightning conductors as well as flagstaffs, a proof of the scientific attainments of the Egyptians.

The open court in front of this temple (which is wanting in Denderah) is spacious and open to the sky, paved with flags and surrounded by thirty-two columns on the south or front, the east and west sides forming a colonnade. The temple itself is sacred to Horus (the sun at his rising). The orientation is exactly the opposite to that at the temple of Denderah, the front of which faces north, whereas this temple faces south, that is, it faces the position of the sun during the daytime, whereas the one at Denderah, dedicated to the gods and goddesses of night, faces the position of the sun in the nether world, according to Egyptian ideas, during the night. The temple was rebuilt during the reigns of the Ptolemies, but the inscriptions inform us that it was carried out according to the plan of the great writing that fell from heaven to north of Memphis. It is further stated that the Great Hall was built according to the arrangements of temples written by Kherheb Imhotep, son of the god Ptah; this shows that the Egyptians in the arrangements of their temples rigidly adhered to the traditions handed down to them from antiquity and preserved amongst them in writing. As at Denderah, a history of this particular temple and a description of the rooms and the uses to which they were put is given in inscriptions on the walls. From the foundation of the new temple to its completion and the festal entry of the deity B.C. 142 was a period of ninety-five years. The hall following the front room at Denderah (a temple sacred to the gods of the night) is called the "Hall of the Appearance," and the next room the "Hall of the Altar"; then comes the "Hall of the Cycle of the Gods." I suggest that this is because after the sun has run his course at night he appears in the hall to the worshippers in all his glory, Hathor being on such occasions being called the Golden Beamed and the sun goddess, and all the powers of heaven are, as it were, awake to their duties; but the corresponding rooms at the temple of Horus (a god of day), at Edfu, are called the "Festal Hall" and the Hall of the Repose of the Gods," which seem to indicate the refreshment and repose of the deities after the day's work is done.

Following the front court, we come upon the Hypostyle Hall, or front room, which forms the first room at Denderah as it now stands. This hall contains, against the front wall and between the pillars, two little rooms, one on each side like chapels, which we learn from the inscriptions were intended, the one on the left as an incense chamber to hold the incense and holy water required on religious festivals, and the one on the right as a chamber or safe for the sacred rolls and books of the temple, a catalogue being given on the walls. The ceiling of this hall is covered with astronomical representations.

A few miles above Edfu the channel of the Nile contracts and passes through a chain of sandstone mountains, which are extensively quarried. Vast chasms are cut down through the mountains in every direction as if they had been sawn, the tool marks of some such instrument as a saw being plainly visible. These were the quarries of ancient Thebes, and extend for miles.

Forty miles above Edfu is the beautiful temple of Kôm Ombo. The peculiarity of the plan is that it is a double temple, with twin entrances side by side, and double twin suites of rooms throughout; the left half on entry is sacred to Horus, god of the day, and the right half to Sebek, the crocodile-headed god (a god of the night). Like the other temples we have been examining, there has been a restoration under the Ptolemies of an ancient building which stood on the site.

A short distance further south brought us to the first cataract, the southern end of Egypt proper, near which are extensive granite quarries. It is said that all the obelisks, granite blocks, and pillars found in Egypt came from these quarries; the labour of working them, and taking them down to the river and to their various destinations, must have been almost incredible.

Above the cataract and quarries is the picturesque island of Philæ, crowned with temples, walls and colonnades. The island is about a quarter of a mile long, and 150 yards broad; the Temple of Isis, with its accessories, occupies about half the length of the island. The temple was built at various times, and owes its charm not only to the gracefulness of its architecture, but also to the beauty of its situation. The inner part of the temple, the first apartment of which is an elegant hypostyle consisting of an uncovered forecourt and a covered hall beyond, with four columns on each side, is one of the most beautiful halls in Egypt, not only on account of its well-balanced proportions and admirable preservation, but especially on account of the beautiful and delicate colouring, which, being very little perished, conveys a better idea than almost any other example of what the gorgeous effect of these buildings must have been when their colours were fresh and unfaded.

On the east side of the island is an elegant little temple, or pavilion, which goes by the name of "Pharaoh's bed," with five columns on each side and four at each end, and half enclosed; it is a favourite subject with painters on account of its elegant form and suitability to the landscape, though the inscriptions within it are of no importance.

A discussion followed, in which Messrs. G. H. Fellowes Prynne, J. Marshall, Dr. Weymouth, R. Phené Spiers, J. E. Newberry, Percy Newberry, and A. T. Bolton took part. A vote of thanks was accorded to Mr. Alexander Payne, who briefly replied.

Messrs. T. S. Gregson, J. A. Hallam, F. C. R. Palmer, W. H. Stonebridge, and R. J. Goulston were then unanimously elected members of the Association.

Annual Elections.

The scrutineers for the annual elections then announced that the following gentlemen had been elected for the next session:—

President: Mr. W. H. Seth-Smith.

Vice-Presidents: Messrs. W. A. Pite and R. Elzey Smith.

Committee: Messrs. G. H. Fellowes Prynne, H. T. Hare, A. Bolton, H. A. Satchell, F. G. F. Hooper, W. A. Forsyth, M. Garbutt, A. A. Hart, A. B. Mitchell and E. H. Sim. (In order of number of votes received.)

Hon. Treasurer: Mr. H. W. Pratt.

Hon. Librarian: Mr. A. S. Flower.

Hon. Secretaries: Messrs. G. B. Carvill and R. S. Balfour.

Mr. W. H. Seth-Smith then proposed a vote of thanks to Mr. G. H. Fellowes-Prynne, the retiring president, and referred in complimentary terms to the great service he had rendered the Association in that position. The vote was seconded by Mr. A. T. Bolton, and was carried with considerable applause. Mr. Prynne acknowledged, and, after referring to the able assistance rendered him by the hon. secretaries, Messrs. G. B. Carvill and R. S. Balfour, and the secretary, Mr. D. G. Driver, proposed a vote of thanks to them which was heartily accorded, and acknowledged by Mr. Carvill.

On the motion of Mr. F. D. Clapham, votes of thanks were passed to the hon. treasurer, Mr. H. W. Pratt; hon. librarian, Mr. A. S. Flower; the editor of "A. A. Notes," Mr. A. Beresford Pite; and the other officers. Mr. W. H. Seth-Smith announced that Mr. Fellowes Prynne had kindly consented to take up the editorship of "A. A. Notes," owing to Mr. Pite retiring, and Mr. H. A. Satchell the sub-editorship. The meeting then terminated.

Dr. Johnson's Birthplace in Market Square, Lichfield, is to be bought by the Lichfield City Council, and will be used as a museum of Johnsonian relics.

Professional Practice.

Leeds.—At last Wednesday's meeting of the Leeds Board of Guardians the plans prepared by Mr. A. Saxon Snell, F.R.I.B.A., of Southampton Buildings, W.C., for extending the infirmary were approved. The committee reported that the most desirable manner of providing additional accommodation was by utilising section 6 and the main schools' building, and erecting additional blocks in place of the old building behind the schools. They recommended the Board to provide infirmary accommodation for 770 cases. The main building of the schools should form the administrative block, containing entrance hall, committee rooms, medical staff and matron's offices, library, visitors' rooms, matron's

A block for male and noisy cases should be erected behind it, and no alteration be made in the front elevation of the schools' building. Separate receiving wards for male and female cases to be provided on the ground floor of the schools' building. A new mortuary would also be erected. The total accommodation would be for 358 males and 412 females. With regard to the extension of the Nurses' Home, the committee believed that the most feasible plan would be by adding another storey throughout. The present dining-room and kitchen could then be thrown into one large room, and a new kitchen provided on the floor above. The committee's recommendations were adopted.

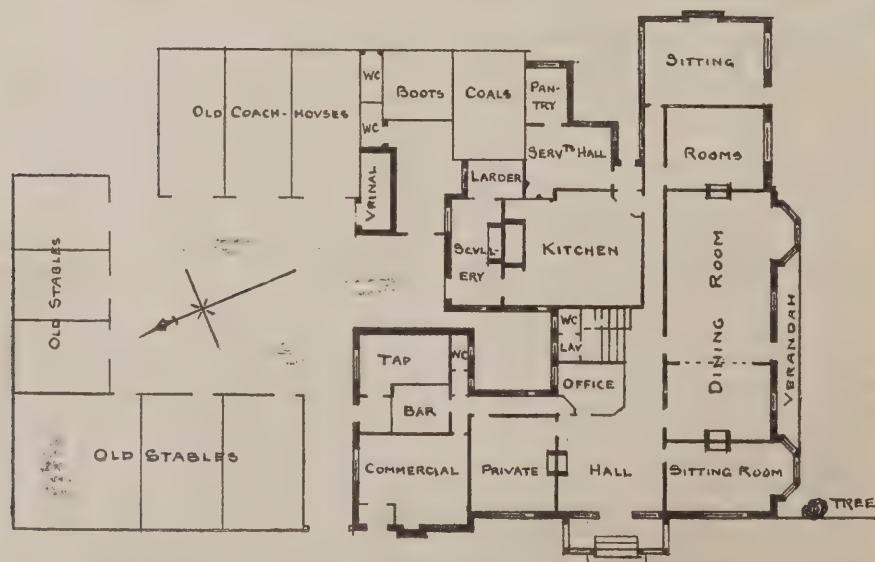

Newcastle.—The Duke of Connaught visited Newcastle last week to open the new Y.M.C.A. buildings which have been erected

half a dozen shops, and several rooms on the upper floors, reached by means of a lift. The café in the basement is well lighted, cheerful, and comfortable. The main dining room is 63ft. long and 28ft. wide, and there are two smaller dining rooms, one being for ladies. There are also in the basement the heating chamber, kitchen, scullery, and lavatories. At the back of the shops in Blackett Street a meeting room 37ft. long and 25ft. wide has been provided, with an entrance from the vestibule of the Y.M.C.A. and an entrance to the stairs of the large hall. On the other side of the vestibule is a bicycle stand, with storage for a large number of machines. Just above this, on the "mezzanine" or half-way floor, a club dressing room is provided, with lockers, a lavatory, and bath room. On the third floor is the gymnasium, placed immediately over the large hall and provided with a double door to prevent any sounds of the exercises reaching the hall. The remainder of the floor, with the exception of one class room, has been arranged as a photographic studio, with reception room and dressing rooms. The gymnasium is 48ft. long and 33ft. wide, and is lighted from the roof; the photographic studio is 31½ft. by 22ft. Mr. Pringle was the contractor.

Southborough, Tunbridge Wells.—The Hand and Sceptre Hotel, occupying a prominent position at Southborough, near Tunbridge Wells, was formerly well-known as a coaching inn on the London road. The old premises, although picturesque, were badly built and very dilapidated, and accordingly the house has been entirely rebuilt as a high-class residential hotel. Besides the accommodation shown on the ground floor plan on this page, there are fifteen bedrooms, two bathrooms, and a large billiard room over the bar with separate entrance. The new plan was determined to a large extent by the position of the old cellars and existing stables, which were retained for use in the new building. The walls are faced up to the moulded string-course with red bricks from a local maker; above that level they are covered with rough-cast all round, except to the billiard room, where they are tile-hung. The large gable on the west front is framed in solid 7in. square pitch-pine, stained and oiled, carried on the projecting floor-joists and six large brackets, and filled in with rough-cast between the timbers. The design is by Richards H. Hill, F.R.I.B.A., and Ernest Hill, A.R.I.B.A., of 3, Lombard Street, E.C., and the work was carried out by Messrs. H. Somerford and Son, of Orpington and Clapham.

Warmley, Bristol.—New parochial offices have been built facing the village green at Warmley. Mr. Henry W. Bennett, Bristol, is the architect. To the right of the vestibule and entrance hall a spacious Board room is provided, which faces Warmley Green in one direction and overlooks the village in the other. To the left of the entrance hall is a well-lighted clerks' office, abutting on which is the strong room. At the end of the hall a room for the relieving officers is provided, adjoining which are the paupers' rooms, separate entrances being provided for male and female applicants who require to see the Board. To the left of the relieving officers' department there is a cloakroom and lavatory for the Guardians. A commodious committee room and a store-room are also provided on the ground floor. The upper part of the building forms the caretaker's residence. The whole structure is well lighted, adequately appointed, and very suitable for the present needs of the Board of Guardians. The contractors were Messrs. Adams and Jefferies, builders, of Oldland.

Hull School of Art: Site chosen.—Three sites were proposed for the Hull School of Art (which is to cost about £19,000), one on the north side of John Street, Kingston Square (facing the Oval), one on the north side of Wright Street, and the other at the corner of Bond Street and Jarratt Street. This last was selected by the Technical Institution Committee last week.

HAND AND SCEPTRE HOTEL, SOUTHBOROUGH, NEAR TUNBRIDGE WELLS, KENT. R. H. HILL, F.R.I.B.A., AND E. HILL, A.R.I.B.A., ARCHITECTS, 3, LOMBARD COURT, E.C.

quarters, and quarters for the assistant medical officer, steward, &c., with servants' bedrooms on upper floors. The upper floors and wings to be utilised as wards, and proper sanitary blocks erected. Other blocks would comprise kitchen and stores (one-storey building), and double wards (three-storeys in height), and a one-storey building for lying-in cases. The committee recommended that the existing medical officer's house be not interfered with.

at the junction of Grey, Grainger and Blackett Streets from designs by Mr. J. W. Taylor, F.R.I.B.A., of Newcastle. The Association itself occupies most of the interior, with a reception room, a reading room, and fourteen smaller rooms in which the general work of the members will be carried on. A large hall for meetings seats 700 persons, and there is a smaller hall to hold 300 people. The portions to be rented include the café in the basement,

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Making a Stable Cooler.

RODBOROUGH, STROUD.—RODBOROUGH writes: "We are asked to make some alteration in the roof of a stable in order to make it cooler in summer. The roof is 30ft. long, 14ft. span, covered with corrugated iron, painted cream outside. It is lined with matchboarding, with layers of thick felt between the iron and the boarding. This stable, notwithstanding ample ventilation, is very hot indeed in summer. What would be the best means of reducing the inside temperature?"

If there were an air space between the boarding and the iron sheeting the stable would be both warm in winter and cool in summer. This could now be obtained by either inserting a second ceiling below the present boarding, or by stripping off the corrugated iron and refixing. Probably an air space of a very few inches would suffice, but as much as 9in. or 12in. would be better. In any case it should be contrived so that a current of air passes along it. G. A. T. M.

Discolouration of Plastering.

BARNSLEY.—G. W. S. writes: "I have lately had some plastering executed with Robinson's cement, and find after it has been finished a few days that a grey discolouration breaks out in some parts, more particularly on the walls. Care was taken to execute the work strictly according to the printed instructions issued by the manufacturers. The wall surfaces are clean and of new brickwork, no ironwork is under the discoloured portions, nor do I find any traces of iron in the sand. On writing to the manufacturers on the subject I am informed it may be owing to the sand containing some iron or to the workmen's tools not being kept clean. That is not the case, else why should the ceilings not be affected? I also find that occasional blistering occurs to the setting coat after being finished a day or two. Will you please tell me what in your opinion is the cause of the above defects and whether they are characteristic of the material?"

In the absence of samples of the work it is difficult to accurately define the cause of discolouration. It may be due to iron in the sand of the mortar used for the brickwork. This theory is partly confirmed by the fact that the ceilings are not affected. The cause of discolouration may be traced by cutting out portions of the defective plaster, also portions of the brick mortar, and having them analysed. This would be more effectual and satisfactory than testing the sand which, it is assumed, was part of, or similar to, that used as an aggregate to the cement. Robinson's cement, like other white cements, is formed from a gypsum basis, and has to be thoroughly calcined and finely ground before being bagged up for commerce; therefore it is not liable to "blister." The blistering is probably due to the presence of imperfectly slaked particles of lime, which may have been incorporated accidentally or intentionally. Some plasterers mix a small portion of lime-putty with the cement for the finishing coat, thinking that it will work more freely, "easier" than if used neat. In my opinion discolouration and blistering are not characteristics of the cement in question. W. MILLAR.

Ancient Lights.

MERE, WILTS.—J. H. writes: "A. has a window overlooking B.'s property. B. has a tenant that wants to put up a workshop. How far must B.'s tenant keep away from A.'s window? In the first place A.'s window was put in on sufferance. But of course it has been

in its present place more than twenty years. A. now threatens that if B.'s tenant puts up anything at all he will pull it down again. Can he legally do this?"

There is no particular distance at which it is lawful to erect the proposed building. It must not be erected at such a distance and of such a height as to cause a substantial privation of light sufficient to render the occupation of A.'s premises uncomfortable, or prevent his carrying on his accustomed business on those premises as beneficially as he had formerly done. In estimating the injury to light by the erection of a building the matter to be considered is whether there is any diminution of light for any purposes for which A.'s house may be reasonably considered available. The new building cannot be erected so as to cause such a diminution. H. P. B.

Mild Steel Stanchions.

BROMLEY, KENT.—J. E. J. writes: "On p. 233 of your issue for May 2nd Mr. Adams gives a formula for the safe resistance to compression of a steel stanchion, H section, which he says is Gordon's formula. I presume this is for pillars of less than 30in. diameter. I have worked out an example according to this formula, and get a result that appears far too small; which suggests a printer's error in Mr. Adams's formula. Should it not read:

$$R_c = \frac{A r_c}{1 + a \left(\frac{l}{d}\right)^2}$$

instead of

$$R_c = \frac{A r}{l + a \left(\frac{l}{d}\right)^2}$$

If I am wrong would Mr. Adams kindly put an example into figures?"

There was a printer's error in the formula given at p. 233. It should read

$$R_c = \frac{A r_c}{1 + a \left(\frac{l}{d}\right)^2} \quad \text{instead of } l + \&c.$$

Example: Dorman Long and Co.'s special stanchion section of rolled steel joists, namely 9' x 7' x 58lbs. x 18ft. high. Then $A = 17.05$, $r_c = 6.5$, $a = \frac{1}{2500}$, $l = 216$, $d = 7$; whence safe load = $\frac{17.05 \times 6.5}{1 + \frac{1}{2500} \left(\frac{216}{7}\right)^2} = 80$ tons.

By Dorman Long and Co.'s table of strength the ultimate load on this stanchion would be 232 tons, and allowing $\frac{1}{4}$ for stationary working load the safe load would be 58 tons. Taking the value of a given in "Notes in Building Construction," Vol. IV., p. 114, for wrought iron of various sections, which would be practically the same as mild steel, namely, $a = \frac{1}{1000}$ both ends fixed, this stanchion works out to a safe load of 54 tons.

HENRY ADAMS.

Strength of T-Rafters.

STOWMARKET.—P. J. T. writes: "I should be much obliged if your expert would explain, by calculations, how the size of a wrought iron T-rafter can be obtained from Gordon's formula.

$$B W \text{ tons} = \frac{16 s}{1 + \frac{l^2}{a d^2}}$$

s = sectional area of inches; l = length in inches; a = constant = 1500; d = least diameter or breadth in inches. Maximum stress on rafter, 15.89; unsupported length, 6.5ft. This is the example given on page 176, "Designing Ironwork" (Henry Adams), and though the size of the rafter is found to be $4\frac{1}{2}$ in. x $4\frac{1}{2}$ in. x $\frac{3}{8}$ in, I cannot follow how it is obtained from the formula given."

The working asked for is as follows:—The sectional area of a $4\frac{1}{2}$ x $4\frac{1}{2}$ x $\frac{3}{8}$ tee = 5.27 sq. in.; $\frac{a}{2} = 750$ for only one end fixed, factor of safety = $\frac{1}{4}$ for roof work.

$$\frac{16 s f}{1 + \frac{l^2}{a d^2}} = \frac{16 \times 5.27 \times 75}{1 + \frac{78^2}{750 \times 4.5^2}} = 15 \text{ tons.}$$

HENRY ADAMS.

Book on Chapel Design.

SHEFFIELD.—J. J. S. writes: "I should feel obliged if you will kindly say if you know of any book dealing with designs, &c., of chapels."

The only book we can recommend is "Church Design for Congregations; its Development and Possibilities," by James Cubitt, with nineteen plates, 8vo. cloth, 1870, a copy of which can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C., 5s. 6d., post free. It was published at 10s. 6d., and is now out of print. The foregoing reply will also be in answer to the query of "W.F." (Upper Clapton, N.), whom we might also inform that there is no stipulation requiring the chancel of a Wesleyan chapel to point eastwards. We have given numerous illustrations of small churches and chapels in back numbers.

New Patents.

These patents are open to opposition until June 19th.

1899.—Metal Window Frames and Sashes.—8,376. C. A. HASLETT, Philadelphia, U.S.A. At each side of the frame are metal tubes screwed into the head and the sill. Weight tubes are also provided, and attached to one end of each sash cord or chain is a T-shaped runner, fitted with springs, with which the sash engages. It is claimed that the framework is fire- and water-proof, and that the parts are easily accessible and repairable.

Roof Glazing.—10,045. C. CORDON, Harpenden. The glass sheets have their side edges slightly turned up, so that there is a shallow trough formed for carrying off any water that may find its way between the glass and the metal capping. This latter is of arched section, with cross tie-pieces, and is fixed in place by screws that pass between the spaces intervening between adjacent sheets of glass. By this construction lead back gutters and aprons at junctions are avoided.

Brick and Tile-making Machinery.—11,084. D. R. ADAM, Paisley. The object of this invention is to enable existing brick-making machinery to be used for making corner, round-nosed, splayed, and other odd shape bricks or tiles, without necessitating the alteration of the moulds of the filling table. It consists of the combination of a device connected with the machine so as to reciprocate vertically, and carrying a knife for cutting off a piece of the clod, a guide-way having an opening corresponding to the piece cut off the clod, and a press-box having a liner made in pieces that fit together to the shape of the required brick or tile.

1900.—Heating and Lighting Basements.—1,822. O. B. H. HANNEBORG, Christiania, Norway. Extending from the roof into the basement is a good-sized pipe having a large funnel-shaped top. This pipe and funnel have mirror surfaces, and over the funnel a large mirror is pivoted to an adjustable arm. The light and heat taken up by the mirror is thus transmitted to the cellar. The device is only intended to be used when light cannot be admitted into the basement in any other way.

Hanging Wallpaper.—4,788. T. E. MOFFITT, Bathgate, U.S.A. The apparatus consists of a rectangular frame having transverse rollers for supporting the paper and guiding it, a reservoir and distributing pipes for laying the paste on the paper, and a smoothing roller. The device is light and is used in the hands, being simply rolled against the wall, which unrolls the paper it carries, pastes it, and smooths it down.

The following specifications were published on Saturday last, and are open to opposition until June 25th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—7,776, DRAKE and GORHAM, method of adapting candelabra for the electric light.

8,111, HULANDS and HULANDS, machines for breaking up roads. 8,764, FISHER, gas burners. 9,020, BEVIS and GIBSON, lift valves, safety valves, &c. 10,587, BERTENBURG and FELLER, self-closing union-joint for water pipes, hoses, &c. 11,577, PEASE, roofs. 11,900, BROWN, locks and keys. 12,359, WADDELL, catch for doors. 12,365, HARRISON, water taps or valves. 12,458, MURRAY, automatic apparatus for periodically discharging chambers or receptacles, particularly applicable to sewage filters. 12,638, WEAVER, insertion pipes and joints for drains and sewers. 12,652, HURRELL and STURGEON, tap for water. 12,712, WOODHOUSE, WOODHOUSE and COOK, syphon-flushing cisterns. 12,874, APPLE-GARTH, glass globes, screens, or covers for electrical incandescent and other lamps. 12,919, BASTOW and JESSOP, wood planing, moulding, and taking-out-of-wind machine with automatic feed. 12,924, FLETCHER, lavatory apparatus. 12,938, DOWSON, manufacture of gas. 12,958, TANNETT-WALKER, planing machines. 13,049, WALKER, WALSH and WALSH, manufacture of bricks, slabs, tiles, pillars, and plaques from small pieces of aventurine. 13,124, LAWSON, glazing for roofs. 13,401, YOUNG, supports for incandescent lamps. 14,470, CHAPMAN, cabinets, tables, &c. 14,897, LAKE (Puttkammer and Orthmann), apparatus for checking workmen's time. 16,459, PONCES, acetylene gas generators. 21,200, JACKSON, incandescent gas burners. 24,118, KOSOV, WISCHEW, SOFONOW and NAUMOFF, locks for doors. 24,360, MCGINN, acetylene gas apparatus. 25,083, BRAZELL, hinges for gates. 25,759, KUNZELMANN, lock.

1900.—751, GODFREY (Emrik and Binger), coating paper, cardboard and other materials with water colours to be used for painting pictures, &c. 1,111, HUDSON and RANN, apparatus for controlling the draught in flues and chimneys. 2,046, GLAUERT, wrought iron window sashes. 3,157, BOULT (Theyskens), manufacture of pulleys. 3,436, RUSZNÁK, means for producing painted patterns on walls and other large surfaces. 4,244, FIMMEN, process and apparatus for the manufacture of artificial stone. 4,453, ROBINS, pipes for drainage purposes. 4,599, BURTON, window holders and fasteners. 4,959, DÖDERLEIN, panelling. 4,969, HEISLER and FISCHL, device for lifting doors and windows for lubricating purposes. 5,009, MARKWARDT, door and window hinge. 5,011, HOFFMAN, spring hinges. 5,034, HINSDALE, flushing valves. 5,055, JACOBSEN, valve apparatus for hydraulic presses. 5,253, LEWIS, apparatus for disinfecting and flushing drains and sewers.

Masters and Men.

The Dundee Slaters' Strike has now moderated, only twenty men being on the strike roll.

The Dispute in the Belfast Building Trade.—Twenty-four employers have acquiesced in the carpenters' demand for increased allowances when travelling outside the city, and a reduction from 54 to 52½ hours per week.

The Cheltenham Builders' Labourers, to the number of 200, have struck for an advance on their present wage of 5d., and are willing to submit to arbitration as between 5d. and 6d. The masters decline to arbitrate unless between 4½d. and 6d.

The Swansea Builders' Labourers have been granted an increase of a farthing an hour, making the standard rates as follow: Labourers, 5½d. per hour; scaffolders, engine and mortar-pan men, and bathstone sawyers, 6d. per hour; hauliers, 4s. per day; overtime to be at the rate of time and a quarter for the first three hours, and then time and a half. Overtime to be paid hauliers after 6 p.m. and 2 p.m. on Saturday. 200 men are affected.

Hull's new Municipal Art Gallery was opened last week. It has cost £3,000.

"BUILDERS' JOURNAL" SHILLING FUND.

AS announced last week, we propose to close this fund on Monday next, May 21st. We shall be obliged, therefore, if any of our readers who still have collecting forms will send them in by that date. It will be seen that we have now nearly reached the total of 3,000 shillings, and we trust that our readers will during the next few days send in the amount required to complete that sum.

Shillings.

Total ... 2,893

The following additional contributions have been received by the Executive:—

FOR INDIVIDUAL SECTIONS OF THE WORK.

Messrs. Cafferata and Co. (Newark-upon-Trent).—The whole of the Plaster of Paris, Keene's, and Parian Cement for the whole of the Homes.
The South Staffordshire Blue Brick Masters' Association (West Bromwich, Staffs.).—25 000 blue bricks.
Messrs. Dixon and Co. (Liverpool and London).—A 50ft. iron church.
Messrs. Anselm, Odling and Sons, Ltd.—The marble steps for the six Homes.
The London Sand Blast Decorative Glass Works.—The whole of the ground glass for the Homes.
Messrs. Smith and Turner.—Sets of hinges for the Homes.
Messrs. Bolding and Sons, Ltd. (second gift), per Mayor of Windsor.—A bath and appliances.
Mr. William Willett.—A staircase for a Home.

FOR THE EQUIPMENT OF THE HOMES.

Messrs. Burroughs, Wellcome and Co., per Mayor of Windsor.—No. 20 tabloid medicine chest, fitted complete.
Messrs. Elkington and Co., per Mayor of Windsor.—80 table forks, 80 dessert forks, 80 dessert spoons, 18 table spoons, 80 tea spoons, 12 salt spoons, 12 egg spoons, 6 sauce ladles, 2 soup ladles, 4 gravy spoons.
Mr. Herbert Mappin (Messrs. Mappin and Co.), per Mayor of Windsor.—80 table knives, 80 dessert knives, carvers and forks.

Surveying and Sanitary Notes.

For Sewerage Works at Leeds £100,000 are proposed to be spent. A Local Government Board enquiry was held on Friday.

The death is announced of Mr. Thomas Nuttall, C.E., F.S.I., of Fernsholme, Bury. He was sixty-two years of age, and was highly esteemed as a Parliamentary surveyor.

Mr. James Green, F.S.I., was last week appointed, for the fifteenth consecutive year, chairman of the Assessment Committee of the Parish of St. Mary Abbott's, Kensington.

Institute of Sanitary Engineers.—At a meeting of the election committee held on May 9th, Mr. J. R. Siva S. Aiyar (Madras) and Mr. J. J. Marsland (Bombay) were elected members.

Keighley Sewerage System.—At the Keighley Municipal Offices last week a Local Government Board enquiry was held respecting the application of the Corporation for permission to borrow £15,670 for sewerage purposes. No opposition was made.

Mare Street, Hackney, N.E., is proposed to be widened at several points so as to obtain a uniform width of 70ft. The scheme also includes the formation of a new street from Morning Lane to Paragon Road, and the total estimated cost of the improvements is £660,750, the estimate for works being £42,000 and for land £618,750. The preamble of the Bill embodying the scheme has been proved.

County Council's Liability for Main Road Accidents.—At the Lancaster County Court on Friday last, Dr. J. J. Butler obtained £15 and costs for injuries received to a horse through its falling on a road that was being repaired by the Lancaster County Council. The macadam had been watered, and, as it was freezing at the time, the surface became like ice. The surveyor had ordered sand to be put on, but this was not done till after the accident.

The Annual Dinner of the Sanitary Institute was held at the Holborn Restaurant on Friday evening, the Duke of Cambridge presiding. Mr. T. W. Russell, in responding for the Houses of Parliament, proposed by Sir W. Preece, praised what the London County Council had done for housing the working classes, and said they were carrying out a great work amidst tremendous difficulties. If there was no room in the cities, the authorities must provide dwellings outside, and that was exactly what the Government proposed to give the Council power to do. It was said that the County Council already had sufficient powers, but that was not the case.

More Street Improvements in Leeds.—The Leeds Improvements Committee have purchased from the trustees of the Burley Church Schools sufficient land to widen that part of Cardigan Lane to 48ft. Other purchases have also been made which will enable the Committee to make a fine approach to the new Burley Recreation Ground from the Kirkstall and Bramley districts. Woodland Lane, Chapeltown, is being widened from 26ft. to 36ft, from Old Pasture Lane to Back Lane,

and the house recently purchased by the Corporation in Blackman Lane, opposite Blenheim Chapel, is shortly to be demolished, and the width of the road increased to 50ft.

"The Improvement of our Roads" was the title of Mr. A. Moresby White's paper last week before the Society of Arts. He thought that up to the present no method of road-making that was absolutely satisfactory had been discovered. The proper method was that of the railway engineer, who used large lumps of slag as a basis, and upon them placed smaller pieces, with finer material still for the surface. Not half enough money was spent in rectifying the early faults in the formation of roads. Drainage of the whole of the road was, perhaps, one of the most important things that could be attended to; but whether they would ever see any tracks made through London for the use of cyclists he did not know. He was bold enough to suggest a year or two ago that it was a matter which should not be beneath the notice of the County Council in making a great arterial road through London.

Disposal of Town Refuse.—In the course of a recent lecture on this subject delivered before the Society of Engineers, Mr. Brierley Denham Healey indicated by a table of coefficients the value of working by several systems, the efficiency of which was shown to vary from .52 to 1.0, the average of six systems being 0.7. He then showed how great was the loss of calorific value when too many furnaces were connected to one steam boiler, and observed that when using natural draught the temperature of the flue gases was considerably less than when using forced draught, the latter requiring about 2lbs. of air per pound of refuse burnt, or say 485 cubic feet per minute, for a consumption of 10cwt. per hour; whereas double that volume of air was usual for natural draught; hence the lowering of the temperature in the flues. The volume is doubled by an increment in temperature of 485deg. F., so that whether using forced or natural draught the same size of flues is necessary. The use of screened versus unscreened refuse was then discussed, the results being in favour of the latter. In conclusion, the author outlined what he considered might probably be the type of steam generator for future destructors. It may be termed a vertical water-tube boiler set between a pair of furnaces or between two ranges of flues, the circulation being so arranged that all deposit would be thrown down in the upper drum.

Wood or Asphalt Paving: Which is the More Durable?—Mr. D. J. Ross, the City engineer, has submitted a report to the London Corporation on the comparative durability of wood and asphalt paving for carriage-ways. He states that the ordinary deal blocks have been in use for paving purposes since 1871, and this class of pavement in streets where the traffic is considerable has to be relaid at intervals of from five to seven years. The Australian hardwood has not been used in the City for any length of time, but judging from observations made outside the City this class of pavement does not appear to be of that durable nature which was anticipated. In some parts of the West End the hardwood paving has been removed and deal blocks substituted. Asphalt has been in use in the City for paving purposes since 1869, when a portion of Threadneedle Street was laid with it experimentally. In nearly all the main streets of the City compressed asphalt is used, and in some of the minor streets where the traffic is small the pavements have been down for thirty years. On the Holborn Viaduct the asphalt pavement has been down for seventeen years, in London Wall for twenty years, and in Lothbury for twenty-three years. In the Poultry the pavement was in use nineteen years before it was relaid, and in Prince's Street the asphalt carriage-way lasted twenty-two years before it was renewed. The engineer reports in favour of the use of asphalt rather than wood in a thoroughfare like the Holborn Viaduct, where the carriage-way traffic represents about 12,000 vehicles in twelve hours. The lowest tender for asphaltting it was £5,980 13s. 6d.; a hardwood pavement would cost £6,000.

Engineering Notes.

Jeffrey Street Bridge, Edinburgh, an iron structure crossing the Waverley station from Jeffrey Street to the Low Calton, has been opened.

Eastbourne Electric Lighting.—The Eastbourne Town Council has decided to expend £33,562 on a new electricity generating station and on the improvement of the present installation.

Electric Lighting at Hull.—A Local Government Board enquiry was held last week into the application of the Hull City Council for sanction to borrow £42,000 for the extension of the electric lighting system.

Harrogate Works.—The Harrogate Corporation propose to spend £35,000 on repairing and covering a disused reservoir in Irongate Bridge Road, and in providing a new high-level tank and three additional filter beds and extending the mains. A Local Government Board enquiry has been held.

London Water Supply.—Last week the Bill of the East London Water Company came before a Select Committee of the House of Commons. The company seeks powers to raise additional capital to the amount of £1,800,000 for the construction of two new reservoirs at Chingford and the provision of new mains and connections.

Ilfracombe Improvement Bill.—By a Bill which recently came before a Select Committee of the House of Commons the Urban District Council of Ilfracombe proposes to spend £44,000 on constructing additional waterworks for the supply of their district and the parishes of Berrynarbor, Combemartin and Morthoe. The supply will be from Exmoor.

Railway Travelling at 120 Miles an Hour.—Mr. Behr, the inventor of the mono-rail system, gave evidence last week before the Select Committee considering the Bill to promote the 110 miles an hour railway between Manchester and Liverpool. He said it would be quite easy on the one-rail system to run trains at a rate of from 100 to 120 miles an hour with safety, and the chief engineer of the Belgian State Railways agrees with him.

Railway Improvements at York.—Alterations are being made to the western side of the passenger station at York, from which access will be given to a new platform and additional lines. Large new stables have been erected in Leeman Road, and a scheme is on hand for the erection of new management offices in Tanner Row opposite the present headquarters. The estimated cost of this scheme alone is £80,000. The existing carriage works at Holgate Beck are proposed to be extended and large new shops erected.

West London Tramway Extension.—The London United Tramways Company are seeking Parliamentary powers this session to construct extensions to their lines aggregating seventeen miles. These extensions include a line between Acton and Hanwell, a continuation along the Staines Road to Baber Bridge of the line already authorised to Hounslow, and a line between Hampton Court and Kingston. The necessary electrical energy will be generated at a single central station, in Chiswick Road, now in course of erection.

River Ely Subway.—On Monday last the new subway under the river Ely between Penarth Dock and Grangetown was opened. Mr. Sibbering, chief engineer to the Taff Vale Railway Company, was the designer, and Mr. Thomas Taylor, of Pontypridd, the contractor, work being started in April, 1897. The subway is 400 yards in length. It has an inside diameter of 10ft. 6in., the footway is 6ft., and there is 7ft. 6in. of headroom. Altogether the construction has cost between £25,000 and £26,000. The subway is bound to give a great impetus to pedestrian traffic between Penarth and Cardiff, as it is a decided public convenience, in marked contrast to the old ferry.

Keystones.

At St. Paul's Church, Hyde, a new chancel and Lady chapel have been provided at a cost of £1,200.

An Exhibition of Art Posters is now open at the Crystal Palace, and will remain open for a few weeks.

Ahiokill Catholic Church, Cork, has been renovated under the supervision of Mr. M. A. Hennessy, architect, of Cork.

What the Academy Receives.—Fourteen thousand pictures were offered to the Royal Academy this year. Twelve thousand were rejected!

At St. Paul's Church, Huddersfield, a new organ has been erected at a cost of about £1,000. Messrs. Abbott and Smith, of Leeds, were the builders.

A Board School in Napier Road, Wallend, is being built for the East Ham School Board. The architect is Mr. R. L. Curtis, of 120, London Wall, E.C.

Christ Church, Chelsea.—Lady Cadogan laid the foundation-stone last week of the new chancel which is being added, together with a new organ loft and enlarged vestries, to this church.

Statue of the Queen for Dublin.—It has been decided to erect a statue of Her Majesty in the grounds fronting Leinster House, Kildare Street, Dublin. The cost will be about £7,000.

New Park for Newport, Mon.—The Beechwood Estate, consisting of twenty-two acres and a modern well-built house, has been purchased by the Corporation for £11,000 as a public park for the Maindee district.

New Baths at Chesterfield have been erected under the supervision of the surveyor, Mr. Nicholas, at a cost of £700. They are situate in South Place. Mr. R. Peck was the contractor, and Mr. Haslam, of Hardstaff, the heating engineer.

A new Reredos and Altar at Benhilton Church, Surrey, have been erected from designs by Mr. W. Hilton Nash, F.R.I.B.A., of Cannon Street, E.C., the work being executed by Messrs. Harry Hems and Sons, of Exeter, in Devonshire-grown oak.

At St. George's Church, Edgbaston, Birmingham, a new stained-glass window has been erected. The window, which has been carried out by Mr. Dunstan J. Powell, of the firm of John Hardman and Co., is at the west end of the building and consists of three large lancet lights, in the centre one of which is the figure of St. George, the patron saint of the church.

New Police Headquarters for Chelmsford: Result of Competition.—Thirty sets of designs were sent in for this competition. The first premium of £100 was awarded to Messrs. Brown and Field, architects, of Ipswich; the second of £50 to Mr. George E. Clare, of Chelmsford; and the third of £25 to Messrs. Charles and W. H. Pertwee, of Chelmsford. The second premiated designs are the ones from which it is proposed to erect the buildings, which are estimated to cost £14,500, as against £19,000 for those shown in the first premiated design.

Garden Cities.—From the particulars and letters which we have already published our readers are familiar with the project for forming "Garden Cities" in which the advantages of town and country shall be combined, and the evils of overcrowding overcome. We have now received a letter from Mr. John McNeill, of 432, West Strand, saying that, "if there can be found sufficient persons willing to combine for the purchase and development into the first 'Garden City' of an estate of about 6,000 acres, no difficulty need be experienced in securing the necessary skill and capital to attain that end." Any of our readers who feel interested in the proposal can obtain the fullest and latest particulars from the Garden City Association at 11, New Court, Carey Street, W.C.

New Masonic School at Bushey.—The Duke of Connaught laid the foundation-stone of a new school of the Royal Masonic Institution for Boys at Bushey on Saturday last.

Steeton Mechanics' Institute.—The new Mechanics' Institute at Steeton, Keighley, has been erected from the designs of Messrs. J. Judson and Moore, architects, of Keighley.

St. Cyprian's Church, Brackley.—The memorial-stone of this church, which is to cost about £10,000, was laid on Saturday. The design was prepared by the late Sir A. Blomfield.

Rebuilding of the Old Bailey.—A private report is to be printed from the City Lands Committee recommending the adoption of one of the six designs submitted for the new sessions house.

Association of Municipal Corporations.—At the invitation of the Lord Mayor of Dublin, 150 corporations have decided to send representatives to attend the general meeting of the Association on June 2nd.

Totnes Cottage Hospital.—This building, the corner stone of which was laid recently, is being erected on the Bridgetown Road, and will cost about £2,000. It is to be of red brick, with a steep roof covered with Bridgewater tiles. Mr. E. Richards is the architect.

The death is announced of Mr. Charles Evans-Vaughan, of Adelphi, W.C., at the age of forty-three years. He designed the town hall buildings in Rosebery Avenue, which cost nearly £20,000, and was elected a Fellow of the Royal Institute of British Architects in 1887.

Tender for the Extension of R.A. Hospital, Devonport.—The tender of Mr. Thomas May, builder, of Plymouth, amounting to £4,636, has been accepted for extending and altering this building. The work is to be begun shortly, and will be carried out under the superintendence of Mr. H. J. Snell, architect.

The Yorkshire College at Leeds.—The extensive additions to the textile and dyeing departments of this institution, which have been carried out through the munificence of the Worshipful Company of Clothworkers of the City of London at a cost of £25,000, were formally opened on Friday last. Messrs. Alfred Waterhouse and Son were the architects.

Devon and Exeter Architectural Society: Three Towns Branch.—The fourth annual meeting of this society was held at Plymouth on Wednesday last, when the following officers were elected for the ensuing session:—Chairman, Mr. Henry G. Luff (re-elected); committee, Messrs. Parker, May, Dweilley, Bazeley and Lethbridge; honorary secretary and treasurer, Mr. B. Priestley Shires (re-elected).

Church Crafts League.—A general meeting was held on Wednesday last at the Church House, Westminster, the Bishop of Rochester being in the chair. The inaugural meeting was held at Leighton House in February, and the results of the first few months' work have been very encouraging, a good number of applications for advice as to church decoration having already been dealt with by the committee. Any persons wishing to have particulars of the aims of the League are invited to write to the secretary at the Church House, Westminster.

The Will of John Ruskin.—The gross value of Mr. Ruskin's estate has been sworn to be £10,660, and the net value at £10,311. His father's estate, almost the whole of which he inherited, amounted to about £200,000. Mr. Ruskin has left Brantwood, at Coniston, and all his real estate, as well as the bulk of his personal estate, including his unpublished manuscripts and his copyrights, to Joseph Arthur Palliser Severn and his wife, earnestly praying them never to sell Brantwood or any part of it, nor to let any part of it on building lease. Mr. Ruskin had left some of his art treasures to the Bodleian Library at Oxford, but he revoked this bequest in a codicil, and left these treasures in trust to go with his residuary estate, with the desire that they should ever remain at Brantwood. These art treasures include a portrait by Titian, and several drawings by Turner and by Ruskin himself.

Views and Reviews.

"PRACTICAL" BUILDING CONSTRUCTION.

The rapid succession of new editions of all the recognised works upon building construction is doubtless a healthy sign of a continuing demand for knowledge, upon the part of those who need it most, of how to secure sound building. At the same time it is a pity that these books should all be of one stereotyped pattern, based upon the requirements of the South Kensington examinations in the subject, and closely following the lead of the first book written with a view to preparing students for those examinations, and to a large extent regardless of the requirements of the practical constructor, and of the changes which have taken place in materials and in methods during the last twenty years. It is questionable, indeed, whether the book now before us ought not to have been entirely rewritten and re-illustrated before it was put upon the market again. Having numerous good points, it is also in many respects hopelessly out of date, and many of the drawings, while apparently clear and to a large scale, are seen upon examination to be merely clumsy, the work of one who is either ignorant or careless of minor exactitudes. Take, for instance, Fig. 931, which shows a lewis exactly fitting the hole sunk in the stone; or Fig. 450, with its tie-rod flattened without being widened before it is enclosed in the cover plates, thus dangerously lessening its sectional area; or Fig. 977, with the shearing stress inaccurately shown; or the inadequate and "faddy" chapter on sanitation; remember, too, that these are only instances taken at random of common faults; so that it will be recognised that before another edition is produced the book calls for a much more thorough revision than it has received upon the present occasion.

M.

"Practical Building Construction" (Third Edition, Revised). By John Farnell Allen. London: Crosby Lockwood and Son, 7, Stationers' Hall Court. Price 7s. 6d.

MR. F. H. EVANS'S PHOTOGRAPHS.

A little exhibition which should not be missed will be open until the 26th instant at the Royal Photographic Society's premises, 66, Russell Square, W.C. Mr. F. H. Evans, in his capacity as bookseller was one of the first to discover the genius, perverse as it was, of the unfortunate Aubrey Beardsley, and his photographs of the young artist, perhaps because the least flattering, are considered the very best. But the subject, provided the sun shines, is indifferent to the photographer, and the reader may now be reminded that of Kelmscott Manor, that beautiful Thames-side homestead, there are no photographs approaching nearly in truth and beauty to those which Mr. Evans has taken. Mr. Morris's own occasional lectures on architecture were illustrated by lantern slides taken from Mr. Evans's negatives, and Morris himself would say that they seemed to make the buildings he loved so well look even more beautiful than he had supposed them to be. A photograph, like a rare stone depends to a very great extent on its setting for its effect, and one may learn in this room how such a thing should be treated, if it seems in itself to be worth keeping. There are choice little bits of landscape conveying, although so tiny, that sense of the vast in Nature which has such a strangely subduing effect on the limited mind of a man, and these are to me as dumb music; but I write after all to advise as many as can to see Mr. Evans's photographs of Ely and other cathedrals, and to decide for themselves whether they are praised overmuch.

E. R.

The Gladstone Statue.—The commemorative statue of Mr. Gladstone erected in the Central Lobby of the Houses of Parliament will be unveiled on Saturday next, which will be the second anniversary of Mr. Gladstone's death. The ceremony will be performed by Sir H. Campbell-Bannerman.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDING—				
May	18	Radcliffe, Lancs.—Church	W. R. Moore...	J. B. Thornley, Architect, Darwen.
"	18	Snapdown, Devon—Reinstating	G. H. Wilkinson	Farm Bailiff, High Bullen, Chittlehamholt.
"	18	Workington—Alterations	Urban District Council	W. G. Scott and Co., Victoria-buildings, Workington.
"	19	Farnham—Offices	J. E. Miller	Leaning and Sons, 28, John-street, Bedford-row, W.C.
"	19	Hunton, near Bedale—Public House	Town Council	T. F. King, Architect, Edgley, Leyburn.
"	21	Okehampton, Devon—Rebuilding	County Council	J. A. Lucas, Architect, Okehampton.

"	19	Salisbury—Drainage	Urban District Council	W. Holt, Council Offices, Salo.
"	22	Aspull, near Wigan—Removal of Nightsoil	District Council	L. Athron, Council Offices, Aspull.

Architecture and Crafts

AT THE

Royal Academy,

1900.

THE walls of the Architectural Room at the Royal Academy are again covered with gilt frames containing drawings of various kinds, purporting to represent architectural work in progress or recently completed. One is inclined to ask how far, if at all, does this collection express the current of progressive thought in modern architecture? All sorts and sizes of buildings are represented; here are the designs for the huge palaces which are being erected to house some of the great departments of State; there are buildings for municipalities—town halls, public libraries, baths, etc.—also large blocks of business premises for companies which control great commercial interests, new schools, churches, private mansions, smaller residences, humble cottages.

* * * * *

Coming to a more detailed consideration of the drawings, the works of the Academicians will naturally attract first attention. Mr. Aitchison, Mr. Bodley, and Mr. Alfred Waterhouse are unrepresented, and Mr. Jackson has only one small drawing of some new buildings at Cambridge University, an afterthought apparently to his original intention of not exhibiting. Mr. Aston Webb exhibits a large frame showing elevation, perspective, and plans for the new buildings for the Royal College of Science, a dignified and well-balanced work of which we give the perspective view.

The new associate, Mr. John Belcher, has several prominent drawings, three being devoted to his building for the Eastern Telegraph Company in Finsbury Pavement, a characteristic piece of work, its purpose indicated by the details and by the large sphere which crowns the central feature. Mr. Belcher also shows the Château Mauricien, Wimereux, and the interior of the Moot Hall, Colchester. Mr. R. Norman Shaw, in conjunction with Messrs. Willink and Thicknesse, has a large drawing of Parr's Bank, Liverpool, on the east wall, which has been hung too high for proper inspection. The building is very simple in design. The base is of grey granite, the upper part shows white with narrow green bands, but the drawing does not indicate what materials are used. Among the other exhibitors, Mr. John Brydon exhibits a large wash drawing, by Mr. C. W. English, of the circular court to his new Government Offices in Parliament Square. It is to be regretted that neither Mr. Brydon nor Mr. William Young exhibit their drawings for the two blocks of Government Offices. The latter has only a model for the inner hall of a country mansion, which is of no particular interest. Mr. T. E. Colcutt shows a classical piece of work in his design for Lloyd's Register Building. Mr. E. W. Mountford is only represented this year by his designs for part of the new Sheffield Infirmary and the Town Hall, Hitchin, the latter in conjunction with Mr. Geoffry Lucas. Both are interesting pieces of work. Mr. Mervyn E. Macartney has five exhibits, all of much interest, the best, if one can be selected, being a competitive design for a public building, probably the most powerful piece of draughtsmanship in the room. Mr. A. N. Prentice exhibits a fine water-colour drawing of The Retreat, Lakenhead—a quaint old-world house befitting its name. The two drawings by Messrs. Ernest George and Yeates are the first two in the room, and both exceptionally pleasing, one, of Holwell Hall, Herts, is a house in the Georgian style; the other shows the oak screen and staircase in the hall, Edgworth Manor, Cirencester. Mr. H. T. Hare exhibits his design for Wolverhampton Free Library. Mr. Gerald C. Horsley shows some additions to Balcombe Place, Sussex, including a fine music room, which should be seen. Mr. E. S. Prior's new Medical Schools, Cambridge, form a particularly severe and restrained building, in harmony, however, with its purpose. Mr. Edgar Wood exhibits a beautiful water-colour drawing of a house at Edgerton, Huddersfield. Mr. A. T. Bolton has drawings of St. Stephen's new National Schools at Paddington, and Mr. T. H. Mawson several drawings of his formal garden designs. Mr. W. H. Atkin Berry and Mr. Jas. Ransome exhibit neat designs for domestic work, which we illustrate. Messrs. Mallows and Grocock have a drawing for the Science and Art Schools, Leamington, and, in conjunction with Mr. Russell, exhibit a design for the Plumstead Municipal Buildings, the second premiated design for the same buildings being shown by Messrs. Hall, Cooper and Davis. Messrs. Harrison and Ward have made an excellent design for the 11 ft. frontage of No. 53, Maddox Street, W.; they also exhibit a quiet-looking house at Warlingham, Surrey. Mr. Temple Moore's designs for a church at Sledmere Park, Yorks., show a very elaborate interior. Mr. R. W. Schultz has a picturesque and beautiful drawing showing the restoration of an old Scottish keep, Wester Kames Tower, and one of a house, "Inholmes," Whitney, which we illustrate. Other drawings are those by Messrs. Dare Bryan, M. S. Hack, Briggs and Wolstenholme, M. H. Baillie Scott, and Cheston and Perkin. Mr. C. H. M. Mileham has a quiet design for ecclesiastical work at Plumstead.

The above is extracted from the INTRODUCTION to the SPECIAL MAY ISSUE of

"THE ARCHITECTURAL REVIEW,"

which is entirely devoted to Architecture and Crafts at the Academy, and which is the first complete record that has yet been published. Fuller particulars are given on the next page.

Architecture and Crafts

AT THE

Royal Academy,

1900.

THE demand in former years for the series of Special Supplements dealing with Architecture at the Royal Academy, has shown the Proprietors of the "ARCHITECTURAL REVIEW" that there is a desire to preserve in permanent form a record of current architecture and design.

The pre-eminent position held by the "ARCHITECTURAL REVIEW" in the profession enabled the Editor to secure the right of reproducing all the chief Architectural drawings exhibited at this year's Academy.

Instead of publishing, as formerly, special supplements in succeeding monthly issues, the whole of the May issue of the "ARCHITECTURAL REVIEW" is devoted to Academy Architecture, and this issue, largely increased in size, forms the most complete and permanent record of current architecture and design.

Although the Royal Academy was only opened to the Public on Monday, May 7th, this issue was published on the 11th, and as all the designs referred to are given their reference numbers, intending visitors to the Architectural Section of the Academy will find this number an invaluable guide.

There are over one hundred examples shown in this special issue, and the following is a list of the Architects and Craftsmen whose designs are given :—

AIKMAN, W.	HALL, COOPER AND DAVIS.	MOUNTFORD, EDWARD W.
AUSTIN, RUPERT C.	HARE, HENRY T.	NEWTON, PERCY E.
BATEMAN AND BATEMAN.	HARRISON AND WARD.	NICHOLSON, CHARLES A.

Trade and Craft.

Carriage and Wicket Gates.

As a maker of high-class joinery, and especially of wood chimney-pieces, Mr. John P. White, of the Pyghtle Works, Bedford, is well known to many of our readers. We now wish to speak of his carriage and wicket gates. It is a satisfactory sign of the times that the level of design and general handicraft has been raised and that there has been a shaking-off of the old spiritless precedents and the adoption of principles and models like those of the great workers of the past. Under this influence the architect, besides attempting to improve the main design of his building, has sought to make the appurtenances in keeping with the general spirit of his design, though it must be admitted there still remains a wide margin for improvement. But the smaller things are beginning to receive his consideration, and one of these is the design of the gates which bar the carriage drive or the garden path. Mr. White has endeavoured to meet the demand for well-designed gates, and in the preface to his catalogue says: "It has hitherto been impossible to obtain either gate or wicket ready made which did not too closely recall the detail and stop chamfering of the Gothic revival. With the assistance of Mr. J. S. Cooper and Mr. C. H. B. Quennell, I have endeavoured to bring gate design up to date. The prices will be found as low as is consistent with the best workmanship, and all hinges, latches, &c., will be of the best make." Of the many kinds shown in the catalogue, design No. 3 for a carriage gate and wicket is most pleasing; the gate is 10ft. wide and the wicket 3ft. 9in. wide. Design No. 5 shows a combination carriage and wicket gate (without a dividing post), the wicket being arranged to open separately, while No. 9 shows a garden gate consisting of two square side posts with round ball tops supporting arms for a lamp hung in the middle, the gate itself consisting of a number of upright bars extending through a braced framework. At the end of the catalogue—a copy of which can be had on application—is an illustration of the "Biddenham" design for a garden seat; this is strong, elegant and evidently comfortable. The accompanying illustration of a garden gate, taken from Mr. White's catalogue, is a fair example of the skill and taste he has brought to bear on this much neglected subject.

New Companies.

Metallic Paint Company, Limited.

This company was registered on May 4th with a capital of £3,000 in £1 shares, to adopt an agreement with F. J. Nicholls, H. Morton, and R. G. Laws, and to carry on the business of manufacturers of and dealers in preparations for coating iron, steel, wood, stone, and other materials. The first directors (to number not less than two nor more than five)

are M. W. Aisbitt, R. G. Laws, and another to be appointed by the vendors. Registered office: 51, Mount Stuart Square, Cardiff.

The Intermico Ventilating and Engineering Company, Limited.

This company has been registered in Scotland with a capital of £6,000 in £1 shares (2,000 six per cent. preference), to take over the business of a firm with similar title, of which James Speirs Paterson is sole proprietor.

New School Buildings at Norwich are being erected in connection with the Unthank's Road Baptist Church from plans prepared by Mr. H. F. Scott, the contractor being Mr. S. R. Wilkins. The estimated cost is £1,800. There will be a central hall 67ft. by 32ft. 6in.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

An Architectural Causerie.

Architecture and the "Man in the Street." IT has been said that the Gothic Revival was doomed to decay

because those who preached it were not the mouthpieces of any national demand, but only an example of the ease with which the active few may trade on the general indifference. It has even been suggested that the stern and almost bigoted partisanship of the leaders was the cloak of insincerity, and that their convictions were really as weak as the number of their followers was exiguous. It seems ridiculous to have to say that this aspersion is absolutely baseless, and that the enthusiasm for those particular architectural forms, and all that they meant, was probably the most genuine emotional outburst of our day. That the people at large was outside the movement, indifferent to it, if not unaware of it, is true, but when the comfortable assurance is given us that the architecture of to-day is sound because the nation is at its back, the doubt obtrudes itself whether any people has ever yet been really interested in matters architectural, except perhaps in the great days of cathedral building, when religion and art were as closely allied as they ever will be this side of the millennium.

All precedent is against this highly desirable state of things. Even in Athens, with every circumstance favourable to it, the really sympathetic feeling for architecture was by no means universal. We find the intellectual man, for example, taking up just the same position of tolerant superiority with which we are familiar in London now.

Xenophon's "Memorabilia" are a perfect storehouse of the *obiter dicta* of Socrates on almost every conceivable subject. Generals in embryo, budding politicians, and, of course, young architects among the rest, thronged together to sit at his feet and gather wisdom there, and, though Xenophon was, as Coleridge wisely said, less truly "Socratic" than Plato, the literal exactitude of a man who, like Boswell, was somewhat deficient in the finer perceptions, without which his master could not be thoroughly comprehended, is a quality inestimably precious to us.

Here, then, freely rendered, is the somewhat chilling reply of Socrates to the enquiring architectural student: "He, then, who is to have a house of the right kind must so contrive that it shall be both superlatively pleasant to live in and superlatively useful. Is it not pleasant to have a cool house in summer and a warm one in winter, and is it not the fact that, in those houses which face the south, in winter time the low sun shines under the colonnade, and in summer, sailing overhead, leaves it in shade? If this is a desirable consummation ought we not to

build higher on the southern side, so that the winter sun may not be cut off, and lower on the north, so as to escape the cold winds? Put shortly, then, that house in which a man can be sure of finding the most congenial kind of shelter at all seasons, and most securely house his belongings, may be reasonably said to excel both in pleasantness and in beauty. Painting and decorative work will detract from our sense of well-being rather than add to it."

So severely utilitarian a contribution to architectural lore, uttered under the very shadow of the Parthenon, is a somewhat hard morsel to swallow, and, if we make a seven-league stride over some twenty centuries, we shall catch from the lips of the immortal doctor something very like an echo of the final words.

The occasion was a meeting of Dr. Johnson and Boswell with Gwyn the architect—a "fine, lively, rattling fellow," Boswell calls him—in the Oxford coach. Johnson expressed his disapprobation of

ornament for its faults, for its tendency to redundancy, for its fatal gift of obscuring blunders; they appear rather to found their opinions on a strained and false application of dry, almost brutal, common sense to the subject matter of an art. This, or something like it, is the characteristic "State" view of architecture in this country, and it was only slightly burlesqued when a well-known Parliamentary arose in the House and declared his preference for a Surrey-side soap factory over New Scotland Yard. Unfortunately, this attitude is far from being the monopoly of official circles. How many Londoners, for instance, as they cross the bridge to Westminster, have a glance for the building in question? Of those who do look, how many see anything in it, or carry anything away from it? The plain truth is that half London is perfectly well satisfied with the type of design which finds its expression in Gower Street as it was; the other half is no less content with Gower Street as it is. The meanness of the one, the cheap meretricious-

THE SCHOOLS, PORT SUNLIGHT. DOUGLAS AND FORDHAM, ARCHITECTS. (See p. 279.)

ornamental architecture, such as magnificent columns supporting a portico, or expensive pilasters supporting merely their own capitals, "because it consumes labour disproportionate to its utility." For the same reason he satirized statuary. "Painting," said he, "consumed labour not disproportionate to the effect, but a fellow will hack half a year at a block of marble and make something in stone that hardly resembles a man. The value of statuary is owing to its difficulty. You would not value the finest head cut upon a carrot."

Dr. Johnson, Boswell explains, kept Gwyn "in proper subjection, but with kindly authority," a considerateness which made the latter pluck up and deal a home thrust in return. "What, sir," he said, "will you allow me no value to beauty in architecture or in statuary? Why should we allow it then in writing? Why do you take the trouble to give us so many fine allusions and bright images and elegant phrases? You might convey all your instruction without these ornaments." Johnson smiled with complacency, but said, "Why, sir, all these ornaments are needful, because they obtain an easier reception for truth; but a building is not at all more convenient for being decorated with superfluous carved work." This contemptuous setting-aside of decoration does not seem to rise from any actual love of simplicity in either instance. Neither Socrates nor the arbitrary doctor reject

ness of the other, have nothing revolting for the untrained eye.

For the millions, indifference is the normal state, and the attitude is perhaps more dignified in itself and less distressing to others than the emotional vagaries of those laudable persons who both proffer advice and lavish applause with generous but mistaken fervour. Not long ago these good people were falling into raptures over the Boadicea group, which is after all only a platitude. No place was too good for it, if we were to believe them—the top of the screen at Hyde Park Corner, the centre of Parliament Square; even, irony of ironies, the site of the Gordon statue, deposed. Give these same enthusiasts an individual piece of work, like Mr. Gilbert's statue of the Queen, and they feel vaguely that fun is being poked at them, and resent it. They are, in fact, the geese who guard the citadel of bad and commonplace tradition; whether cackling in jubilation, or raising the hiss of terrified perplexity, they are unerringly and everlastingly wrong. If the ranks of the army which, to sanguine eyes, is marching under the banner of architecture, are recruited from such material as this, then it is no better than an armed mob; but the army in sober reality is the merest phanton. All we have any real warrant for saying is that, while the body of cultivated opinion, outside the professional ranks, was perhaps never larger or better inspired than at present, or munici al authori-

ties more alive to the duty of cultivating what is beautiful, and setting an example to private enterprise, architecture itself rejoices in the vitality which springs from these larger opportunities, from the greater appreciativeness of the public, from a more pervading sense in the artist of his privileges and responsibilities. All these will gather force as the years go on, but the nation as a whole is not interested yet.

A. E. S.

"Restoring" Doncaster Parish Church.

FORTY-SEVEN years ago, in 1853, the ancient parish church of St. George, Doncaster, was destroyed by fire. It was a great calamity, for this was one of the finest churches of Yorkshire, and its great central tower was not only a prominent landmark for many miles around, but had also a peculiar place in the affections of Doncaster people, who are not all engrossed in the St. Leger, or others of the races for which Doncaster is more notable to the outside world than as a centre of spiritual activity. The church had, of course, to be rebuilt, and almost equally of course it was designed by Sir Gilbert Scott, even although there was a very competent architect in Doncaster, to whom the work should have fallen. Scott was at that period rather more than a fashion. Indeed, he was almost a superstition. Like the great William of Wykeham, four centuries and a half before, "everything was done by him, and without him nothing." We owe an apology to the shade of Wykeham for the conjunction of his name with that of Scott, but let that pass. Scott literally overran the country, and was the Whiteley of architectural practice for some thirty years—a veritable Universal Provider. Did you want a church built or a cathedral restored he was your man; and equally your man if the commission for a Government office was going, or the building of a railway terminus to be had. No false pride about him; a Gothic railway terminus while you waited, and, although confessedly unable to properly design in Renaissance, rather than lose the work, he designed an "Italian Renaissance" block of Government offices in Whitehall, which is an admitted failure. The man was too busy. With insatiable greed, he grabbed everything and lacked the time to perform his work with due care. Apart from the inevitable unchanging Scott formulæ in design, we have another quarrel with him. He took little or no care to select his building stone, with the result that the works he did are even now going to decay. From one point of view—that we shall have so many characteristic pieces of Scott the less—this may be no loss; but for many good folk who need safe churches to worship in, and cannot readily distinguish between good, bad, or indifferent architecture, it is distinctly disappointing to find stones falling and carving crumbling before a building is fifty years old. Thus, there is some natural indignation in Doncaster that necessity should arise for the present restoration of the church that Scott rebuilt from the ground in 1853, and for which appeals for a sum considerably over a thousand pounds are being circulated. A wrong choice of stone is in this case said to be the cause of the decayed condition of much of the exterior work, and probably the greater part of the crocketing and the whole of the undercut foliage carving will have to be renewed. Carving of the most conventional kind it is, and in its endless unchanged repetition typical of the uninspired nature of the designer. No inspired artist he; no resourceful Sedding; no enthusiastic Street!

C. G. H.

On Reflection.

Something Missing. It would be futile to deny that there is a general lack of uniformity in our London street architecture, though it is doubtful whether artistic people would agree to call this a defect. Many, having in their minds memories of the old portions of Continental towns, declare that diversity of style—or perhaps we should say appearance—makes a picturesque street. Others, impressed with modern Brussels or Paris, declare as emphatically that the Quadrant in Regent Street is our only piece of street architecture that justifies its existence. It is not our intention to treat upon this vexed question which is being so vigorously discussed in connection with the Strand improvements. We wish to point out that, having adopted the "close formation" order of building, it must be continued, and that any permanent gap in our serried ranks of tall houses and shops constitutes a public eyesore. If it is necessary to emphasise the point, we would ask the reader to walk down Oxford Street and Holborn and see the new stations of the Central London Railway Company. The Company does not apparently intend to carry its building operations above the ground floor, and thus we have great gaps in the lines of houses, disclosing dirty back-fronts and outbuildings behind. In such an overcrowded city as London we should have thought suites of offices or flats above the stations would be a paying investment. Possibly the stations are not intended to be left in their present condition, and we sincerely trust not, for these gaps, as we said before, are an eyesore, and their irritating effect is heightened by the protection of black roofing felt, fixed with white battens, which covers the discarded party walls.

Nottingham. THE forthcoming opening of the Nottingham Central Station marks the completion of a great railway undertaking, and the dawn, let us hope, of a brighter architectural era in that city. Architecturally speaking, Nottingham is one of the queerest cities in the provinces. Most of our cities have more or less well-defined areas, their central business quarter, their first class dwelling quarter, their second class dwelling quarter, their slum district, and their factory division. Nottingham is unique in having all these divisions hopelessly mixed up. It is a city without beginning or end. Public buildings, private dwellings and factories are mixed up in endless confusion. Dirty warehouses and workshops face the Guildhall and loom up at the back of the University College. Furnace chimneys rise in the middle of the residential quarters and slums within a stone's throw of the market place. The new railway has rendered immense service to the city in sweeping away a large portion of the old slums quarter; but there is still much property round London Road and in the Smeinton district that could well be spared. There are three high-class dwelling quarters—"The Park," Carrington, and the little village, now practically a suburb, of West Bridgford on the south side of the Trent. The Park lies to the west of the Castle, being part of the Newcastle estate, and contains some of the best houses in the city, and although the majority of them have no architectural style or merit, they are preferable to the showy and pretentious dwellings at Carrington which breathe the spirit of the *nouveau riche*. West Bridgford, the newest residential quarter, consists mainly of comfortable semi-detached houses for professional men and prosperous tradesmen. But the great blot upon the architecture of Nottingham appears to date from the past lace trade boom. It is the

great area of mean, cheap, speckled-pink brick dwellings which lies to the north-west of the town round Shakespeare Street, Dryden Street, Mansfield Road, and away west of the Forest to Radford and Basford all round the Grand Theatre. The enormous area covered by these houses makes the city practically hopeless from an architectural point of view. That the building of this low type of dwelling was a grievous mistake can easily be seen, but the mischief is irreparable. Still, there is much that the corporation might do. The clearing away of the miserable houses between Parliament Street and the Guildhall and the laying out of the space as a public square, and the clearing of the factories and workshops between the University College and Burton Street, and the extension of the College buildings as a technical institute or some similar worthy institution would make a fine centre to the city. The corporation might, too, consolidate the public offices by erecting a building for the Water and Rates Departments on the site at the back of the Guildhall. This would involve the destruction of the Circus shed. It is extraordinary that a city which has laid out boulevards and a riverside promenade could permit the erection of such a place in close proximity to its chief public buildings.

The Slum of To-morrow.

"WHY pay rent?" is a startling line that frequently greets one in our suburban papers. "Why pay rent?" when for a small sum down and instalments for half a lifetime you can "buy" a modern freehold villa residence with tiled forecourts, electric bells, bath h. and c., &c., &c., secured to you by free deeds, the whole paradise situated in a rising and salubrious neighbourhood, within easy access of 'bus and rail, and with excellent views of two board schools, an iron mission church, the local workhouse, and 500 similar freehold desirable modern villa residences. Undoubtedly this speculative work must pay, or the advertisements would not appear with their accustomed regularity, but we pity any man gulled by these advertisements into buying such property. Put up to sell, they need repairs before the ink is dry on the title deeds, and these repairs are but the first of a long series of similar attentions which leave the house-owner at the end of five years with the unpleasant conviction that he has practically reconstructed the house at about half its original cost. We recently came across a street of such houses in the Fulham district, and on most of them the word "sold" was prominently displayed. In a few years the owners will probably feel that it is they who have been "sold." But if the owners are in sorry plight the community at large also suffers. The freehold villa residence of to-day will be the slum of to-morrow. The majority of buyers belong to the poorer middle class, and they cannot afford the necessary repairs. In time their houses will sink into decay and ruin, a lower class of tenant will inhabit them, a class never very prone to the cleanliness that is next to godliness, and so this property will increase in squalor and filth until it becomes the slum pure and simple. When one thinks of the enormous belt of these houses all round the metropolis the prospect for future generations is appalling, for it will be beyond the power of any County Council to buy out and clear away. A remedy for the evil would be greater powers to the authorities, powers to control the erection of buildings, and to see that if capital is limited the money is spent on sound bricks, good mortar, and well-seasoned timber instead of on the soft rubber-brick fronts, artificial stone dressings, tiled pavements, electric bells and other gimcrack attractions upon which the sale of this rotten property depends.

THE VILLAGE SHOP, PORT SUNLIGHT. GRAYSON AND OULD, ARCHITECTS.

Modern Industry and the Village.

By ESTHER WOOD.

TO say that architecture reflects the social and industrial habits of a people, and changes as they change, is, of course, a truism. Modern industry builds its peculiar monuments upon the ruins of a pastoral society, and factory labour has broken the bonds which tied the peasantry to agricultural estates. The ideal village of the painters and poets—the picturesque hamlet with its old church, manor house, and cottages—is passing away, and its population is being absorbed in towns and cities which have wholly altered the face of its life. But while we may deplore the loss of so much that is romantic and beautiful in the village of olden time, we must remember that modern industry has its reconstructive as well as its destructive side. Architecturally considered, there seems to be no reason why the growth of town life should mean the triumph of all that is hideous and degrading, though it is the fashion with many writers to assume that it must be so, or that the centres of work and trade should not be as dignified and artistic as talent can make them.

The building of the modern industrial village or factory town is based, of course, on conditions very different from those which brought together, in the course of centuries, the straggling cluster of homesteads which hung upon the goodwill of the parson's wife and the squire. Labour to-day is more highly organised, more centralised now than ever before; and our "captains of industry" are finding it among their social functions to provide large residential colonies for their employees, a provision from which the "model" village or township naturally springs. When built upon a philanthropic basis, it may naturally become like Saltaire—as mean, sordid, and insanitary as an ordinary slum. On the other hand, it may be made as healthy, comfortable and picturesque as Bournville, the settlement which Messrs. Cadbury have found so commercially profitable, thereby happily removing it from the sphere of economic dispute. Similar and very successful experiments have been made in France by Leon Harmel and other manufacturers, and in England by Mr. W. P. Hartley, at Aintree, Liverpool; by Messrs. Lever Brothers, at Port Sunlight, Birkenhead; and by the proprietors of Cresswell, a small mining town near Bolsover. It is from the two last-named that our present illustrations are taken.

The dominant idea in the building of Port Sunlight has been to get away as far as possible from the Saltaire type—the monotonous rows of square-set streets, with dwellings all one shape and size, which at the best could only result in a feeble copy of New York; and to proceed with as much diversity of treatment as a pleasant and open suburb would allow. The insuperable difference between the modern village and that which has slowly grown out of the past is that the latter bears the stamp of many ages, many traditions, many generations of men; while the former, springing up, as it were, in one night, for a new generation without local sentiment or history, is apt to depress us with its hard newness and isolation of interests in life. The problem for the modern architect on such an estate is to find in these fresh conditions of house building a dignity and beauty of their own; to atone for lack of tradition and precedent by originality and fertility of design, as well as a certain sympathetic reverence for the future and for things that are new. His task is to give to the working miner and the "Sunlight" soap manufacturer

a home, which, without aping a suburban villa, shall be admirable and even enviable to his neighbours, and to secure for the public something pleasant to look upon in the place of the landscape he is bound to destroy. Instead of coming together haphazard at the will of the jerry-builder, or being ranged in solemn blocks like barracks or penitentiaries, the modern industrial colony is rationally and symmetrically built from its centre to its edge, with its street-plan fully worked out beforehand and due provision made for parks and gardens, markets and public buildings, and every necessity of social life. It should also be possible to be systematic without finality—leaving ample margins for something to be added year by year, and thus securing some hint of what one misses in a mass of contemporary work, the sense of natural growth and enlargement, expressing the development of the life within.

The village of Port Sunlight has great advantages of site, being grouped on each side of a valley, which gives opportunity for a central bridge, making a very picturesque feature in the general plan. Bridge Street thus becomes the central thoroughfare across the village, and the schools at the centre of it are given a convenient position and an open aspect. Round these the various groups of houses are broadly scattered and well broken up, and have ample gardens and footways.

The public buildings first claim attention. It may be noted in passing that from Port Sunlight estate both the church and the public-house are absent. The schools are used, however, for public meetings of many kinds, and might easily pass for a church in appearance. They are of brick, with Runcorn stone dressings, mullioned windows, and steep slated roofs; and they have at one end a broad octagonal tower, out of which a flèche rises from within the parapet wall. The grounds are enclosed by light railings and planted with shrubs, and the wide pavement is set with seedling trees. The principal shop is a cheerful and prosperous-looking emporium, occupying a large corner site near the schools. Messrs. Grayson and Ould are the architects. With a base of Runcorn stone, the upper part is somewhat elaborately half-timbered, and has a handsome mullioned bay projecting from the centre of the residential floor. The roof is of tiles, forming wide gables right and left. The shop door stands anglewise to the cross roads, and has over it a signboard hung in a light wrought-iron frame. The construction of the private door, with its simple vertical boarding framed into top and bottom rails, is very pleasing. The village club is a roomy and hospitable building, standing alone, with a

THE VILLAGE CLUB, PORT SUNLIGHT. GRAYSON AND OULD, ARCHITECTS.

THE DINING HALL, PORT SUNLIGHT. WILLIAM OWEN, ARCHITECT.

Runcorn base and brick up to the first floor. The upper part is thence carried out in half-timber and plaster, with the vertical timbers framed in top and bottom cross-pieces. There is a tiled roof, broken by dormer windows, and a cupola rises at the back. The first floor projects in front over an open verandah extending across the width of the house. The windows are mullioned and the entrance doors simple and austere.

The general dining hall is a remarkable structure, and at first sight puzzles us as to whether we are approaching one end of the Crystal Palace or the tropical house at Kew. It is not, however, so entirely ugly as the illustration might suggest. The red tiles with which the gable is hung relieve considerably the bald and uninteresting frontage, and the side that looks out upon the grounds is much more inviting and pictorial. A closer inspection reveals many excellent structural qualities, and the building is well adapted for its practical purpose, being substantial, roomy, and well ventilated in the roof. It is doubtless the immense expanse of windows, projecting in a bay over what looks like a stable door, that gives it the hard hot-house or menagerie appearance. The roof is tiled and the first floor half-timbered with oak left clear. The dining hall, as a public institution, will doubtless take an increasingly prominent place in the building of industrial colonies, the result, of course, being to economise the time and labour of the employees in preparing private meals, and, in the case of large numbers engaged in the same industry with similar working hours, the plan of communal dining is probably convenient. There seems room, therefore, for the design of buildings that shall be more homely than a restaurant, and more business-like than a home.

But the most admirable work is certainly in the private dwellings, which show an unexpected and refreshing diversity of plan. The first group is by Messrs. Douglas and Fordham, the architects of the schools. These houses stand high in pleasant sloping gardens, and are of plaster and half-timber, with a shallow base of Runcorn stone to the under side of the plinth. Above is half-timber work filled in with plaster, the beams running chiefly in vertical lines, with sparse diagonal crossings. In the first, the transference of the reception-room window to the side of the house is very bold and unconventional, since it leaves the lofty but simple front door to fill the lower half of the chief elevation, which it does admirably. The ground floor windows are brought out in slated bays; the upper ones have leaded lights. The roofs are tiled, and the end gable is faced with slabs of stone laid in cement, which cease at the ground floor and spread out to cover the porch.

The second group, by Mr. William Owen, is no less original and interesting. In this case the Runcorn stone not only covers the ground floor elevation, but runs up at one corner in a curve to the roof, thus making the end of the house, as far as the gable, of Runcorn stone entirely. In the frontage the stone ceases at the level of the first floor, save in one projecting bay of the same, which rises from the ground and goes through the slate roof above. Some of the chimneys are circular with diagonal mouldings, others are tall and square, transversely set. The same simplicity in the front doors is again noticeable, and also the agreeable slope of the garden towards the road.

The third group is by Mr. Heron Matear. Here we have Runcorn stone to the sill-line of the ground floor, with plaster and half-timber used diversely above it. The first floor projects very slightly, and the most conspicuous object in the group is the tall, isolated chimney-stack, which seems to require some further relation to the roof.

The accompanying plan of Cresswell village, built by the Bolsover Colliery Company, indicates the arrangement of the cottages in a more symmetrical manner than on the Port

Sunlight Estate. The north centre is occupied by the schools, with the general stores and clubhouse on either side of them. The oblong space in the centre of the village is laid out as a recreation ground, and among the several types of dwelling are those shown in our illustrations. These are of plain brick, with deal woodwork painted white—the design of Messrs. Brewill and Bailey. The roofs are tiled or slated, and some of the gables are finished with copings formed of brick on edge. Economy of space, combined with ventilation and sanitation, has been the rule for the interiors, as it should be indeed, on a varying scale, in all modern house building.

THE AMERICAN CARPENTER.*

By R. H. GRIFFITH.

WHEN we presume to criticise people we ought in common fairness to disabuse our minds as far as possible of preconceived ideas, and to approach the subject like a little child, with a mind open to every impression. It requires an effort, and something like culture, to be able to sincerely say, "He who differs from me is not of necessity a fool." I do not claim to approach the subject armed with the qualifications set forth above, but should I fail in other respects, I shall try to be fair and honest in what I have to say.

American Carpenters and Carpentry.

In England we use the term "carpenters and joiners." In the States they use the term "carpenters" only, and when I speak of America I mean the United States and Canada. The American carpenters are careful of their personal appearance, affect white shirts, and work in overalls. They have but very few holidays, are good timekeepers, and are sober; those who are single—and they are a great number—live well in a boarding-house for about 4.50dols. (18s.) a week. Their wages average about 2.50dols., that is 10s., a day of nine hours, they work Saturday afternoons, and are seldom paid at an extra rate for overtime. The speed at which they work is greater than prevails with us, and each man tries continually to outstrip his neighbour; in fact, it is a continual race with them. What is wanted over there is speed and a good surface—a sort of superior jerry building. As an illustration of what I mean I will give you a couple of cases that are to the point. While

* A paper read before the British Institute of Certified Carpenters on May 5th, 1900.

HOUSES AT PORT SUNLIGHT. DOUGLAS AND FORDHAM, ARCHITECTS.

working in Detroit, and as yet unaccustomed to American methods, I found myself badly left behind in putting on mortise locks. The contractor I was working for saw me fiddling with a keyhole; he approached and pointed out to me that in making neat keyholes I was simply robbing him. "Don't you see those finger plates," said he, "they were made and bought to cover those holes." That was enough for me; I made a $\frac{3}{16}$ in. twist bit do for mortice, keyhole and spindle, and when the plates were on I was astonished to find that everything worked charmingly and looked all right. The screw heads especially looked well, for most of them had been put in with a hammer; by this means I kept my job and transmitted the custody of the wooden spoon to some one else. I did not like this way of working, but I could do it, more especially as my living depended on it. Shortly before I arrived at Seattle, a town in the State of Washington on the Pacific coast, the place had been burnt completely out and the inhabitants were living in tents. The new buildings being put

MINERS' COTTAGES AT CRESSWELL. BREWILL AND BAILY, ARCHITECTS.

on earth where the workers have the talent of organising like they have in Britain; no other country enjoys such liberty, and that without abuse. An anarchist is harmless in England; elsewhere he is dangerous.

Every citizen over twenty-one years of age has a vote in the States, but the American working-man does not count in politics, and public opinion as we understand it here does not exist over there. Bribery and corruption are rampant, intimidation is not unknown, and open voting is, or was, the rule in nearly all the different States. The chief ambition—and a very laudable one—of the American carpenter is to buy a plot of land and build a wooden house upon it. Many of them succeed in doing this. The States have a large moving population, and

their own, calling the place Walkerville in honour of their president. They build houses and open stores, saloons, and even a bank sometimes; they lay down water pipes and an electric light plant; they have a boat on the river, and often construct a branch railway to tap a trunk line. They buy a few timber claims, and install a first-class plant. After all these preparations are complete they start running, and one by one gobble up all the smaller manufacturers in the same line in the district. Their workpeople are their slaves; they work in the company's shops, buy in the company's stores, live in the company's houses, and drink in the company's saloons. How can they help it? If they want to go away they must take the company's boat or railway; the only other alternative is to walk. If they

MINERS' COTTAGES AT CRESSWELL. BREWILL AND BAILY, ARCHITECTS.

up were very fine ones indeed, and I became an expert hand at casing windows; moulded jamb linings, panelled window backs and fine architraves I rushed up by the score with never a plug near them—I made one thing hold the other up. The mitres were neat and the joints close, they looked well and that was all that was wanted; had I done them in any other way I should have been discharged as no good. True they would not stand kicking, but then they were not put up to be kicked; should they fall down some day that was no concern of mine. Such a state of things is not good for a trade, nor for those for whom the work is done.

In both Canada and the United States, but more especially in the latter, our trade is very much sub-divided. There are erectors, finishers, bench hands and machine hands, but comparatively few capable all-round hands; a carpenter and joiner who can do all cannot do one thing quick enough. Practically speaking, there is no apprenticeship; they begin as axe and saw men and gradually develop into craftsmen. Probably that is one of the reasons why our trade occupies so low a level over there. The worst paid trade is the painters'. We come next, in company with the hod carriers. Want of proper organisation is also a factor to be taken into account. The American Brotherhood of Carpenters and Joiners is about as good as no society at all, and not to be compared in any way with the Amalgamated Society in this country. Workmen over there distrust each other; their trade movements are conducted with bounce and not with money, and consequently they invariably fail. I do not think there is another country

PLAN OF CRESSWELL VILLAGE, NEAR BOLSOVER.

travelling tradesmen are met with everywhere; they are generally single men, and they spend a good part of their savings on the railways. I know the class well, for I was a member of that fraternity for nearly nine years.

Industrial Concerns

in the States are organised on different lines to what they are here. Let us suppose that the undertaking is to be the manufacture of joinery. This is how they usually go about it. A company is floated with a large capital. They do not care to pay fancy rents, and they want to make all the profit possible from the venture, so they go out into the country, where land is cheap, and start a township of

presume to have a grievance the company will only treat with them individually, and we all know what that means. If they get desperate and strike, the company swears in a lot of special constables to protect their property, and arms them; sometimes they hire an armed force of Pinkerton detectives. These special constables and detectives, who are allowed by the State to carry and use firearms after taking an oath, are willing to shoot down their fellow-countrymen for 2dols. a day. If all these are not enough to guarantee peace, the National Guards—that is, a sort of militia force—are called out; for is not the first duty of Government to protect property? What is called the "Truck System," illegal here, is smart business over there. These

MINERS' COTTAGES AT CRESSWELL. BREWILL AND BAILY, ARCHITECTS.

large trusts become so rich and powerful that political parties, and even the Government, become their tools. The most respectable and powerful political party in the States at the present time—the Republican party—dare not legislate against them. Some day we shall probably read of an industrial revolution taking place over there; the salvation of the country will demand and justify it.

American Wood-working Machines.

America is eminently a wooden country; it is also the home of labour-saving machinery and labour-saving tools. Their wood-working machines are, without a doubt, the best in the world. Their spindles ("shapers" they call them) are double-headed and revolve in opposite directions, and are, according to my experience, far more effective than single-headed spindles. The general joiner idea does not find favour over there; a machine that can do everything takes too much time to set, and can do nothing effectively; one machine for one purpose is the best if it can possibly be afforded. It is commonly stated as a reproach that American machinery has but a short life, which more than neutralises its greater capacity. Personally, I do not consider a machine warranted to last till the crack of doom a profitable investment. Let us take the life of a machine at, say, fifteen years. By that time there ought to be a better machine on the market, and repairs, we all know, are expensive in more ways than one.

I notice that frame saws are still in vogue in this country. In the timber mills of the State of Washington, the largest of their kind, they use two large circular saws, one placed above and a little in the rear of the other, a travelling platform carrying the log. The teeth of these saws are screwed in, and when the saw is to be sharpened they are taken out, screwed on the fence of a sharpening machine—that is, a grinder—and in less time than it takes to tell an emery wheel sharpens them all at one time, and to exactly the same size. These machines cheapen production, and allow unskilled labour to enter our ranks; they are inevitable, but they destroy our trade, and joiners are not the only sufferers. I am sorry I cannot discuss these machines at greater length, as I must hasten on.

Hand Tools.

The American hand tools are, generally speaking, superior to the English. Their levels are about 2ft. 3in. long, with a plumb and a level-glass, and they are very handy indeed; most of their short-handle axes are only ground on one side; this I also think an improvement. It has now become very difficult to buy in the States a screw-

driver that has not some patent or other on it. The twist bits and socket-paring chisels are much superior to centre bits and firmer chisels. It is necessary to become used to these tools to fully appreciate their superiority. The teeth of both the rip and cross-cut saws are smaller over there than is the case with us; nine teeth to the inch make a very good saw for general purposes. American iron bench planes and block planes are familiar to you, so I need not discuss them; I may, however, say in passing that it is necessary to true up their faces, for few, if any of them, are true when bought. The American iron plough is certainly handy for some things, but, generally speaking, it is more of a gentleman's toy than a workman's tool; it does too many things. I wish to say a word or two about a very good tool they have over there, and which we very seldom meet with here; I mean the "steel square." No American carpenter is without one—indeed, he would not be happy without one. This is an extremely useful tool with great possibilities, and is used for setting out roofs, braces, and, in short, for all manner of work; some day, perhaps, it will find favour over here; it certainly deserves to. American

wooden planes are inferior and many of their patent tools are no good. There are

No Technical Schools in America

like we have in England—at least I never saw nor heard of one. There are technical colleges for the professional class, but no evening schools for the artisan. This fact and the sub-division of labour cause the American carpenter to be far behind the English carpenter in all-round technical knowledge; for example, how often have I seen joists trimmed over there with double tenons. The American carpenter is more of a schemer, more fertile in resource, more methodical and far less conservative in his ideas than the English carpenter. In the town of Seattle I once had a foreman with whom it was a liberal education to work. The building was a large one and everything was done on the job. One part of the basement was fitted up as a machine shop, another part as a workshop; temporary closets were connected with the drain, every convenience was studied, and a joiner never did what a labourer could do. Everything was prepared ready for fixing in the basement, even to the mitre boxes, saw trestles, and nail boxes for the fixers. Men never had to ask what they were to do next, and seldom changed their jobs; carts came in one way and went out another way, order and method were supreme, and everything went like clockwork. I have seen thirty joiners engaged in one day, and only four or five of them left on the job at the end of the second day, the rest having been discharged as no good; men were plentiful and jobs hard to get. I have seen these wholesale discharges take place repeatedly; the effect was reckoned good.

The hardware in America is very well packed. Let us take the hinges for example. They are made nearly all with a loose pin; you fit one part of the hinge on the frame and the other part on the door; you then lift the door into position and put in the pins. There is never any need to rimer and countersink for the screws, which are packed in the same boxes as the hinges and fit exactly; if anything is wrong you send the packer's number to the firm that supplied them. We now come to

Wooden Buildings.

These are often put up three and four storeys high; some are lined on the outside over the rough boards with a single brick veneer, tied to the boarding with hoop iron, while others are covered with clap boarding, or feather-edge boarding, fixed horizontally; all are lathed and plastered on the inside. In small houses a storey and a half high the usual mode is to

HOUSES AT PORT SUNLIGHT. WILLIAM OWEN, ARCHITECT. (See p. 279.)

HOUSES AT PORT SUNLIGHT. HERON MATEAR, ARCHITECT. (See p. 279.)

carry the joists of the top floor on a "ribbon" let into the side of the uprights; in the larger erections each storey is framed independently. When I say framed I mean toe-nailed together, for mortises and tenons are seldom seen in these kinds of erections. The roof covering is usually of cedar shingles, sawn, not split, and not wider than 8 in. The scantlings used in the frame of such buildings are 2 in. by 4 in. and 4 in. by 4 in. These buildings are durable and warm, lend themselves easily to decoration, and give every satisfaction. Cedar shingles are reckoned to have a life of twenty years, but they often last much longer. It is not uncommon sight to see a frame house—that is, a wooden house—make a journey from one site to another. Do not imagine that they are poor affairs. Often the finishing inside them is very superior, and their outside appearance very ornate. In all better-class buildings the floors are double, the top floor being laid when the buildings are finished—or "trimmed" as it is called here. It is seldom that scaffolds are used by bricklayers and masons, as they generally work overhand from the inside, their staging being trestles and planks. The system of supervision on buildings and in shops is not to watch the man, but to watch how much he does and how he does it; this is more effective and less humbugging than watching the man, for some men can work hard and do little, while others can play with their work and do a great deal.

The American carpenter's knowledge and opinion of other countries are very elementary and imperfect. They have an idea that we in England, for instance, only earn about 6d. an hour, or even less; that we only eat fresh meat about once a week, that we touch our hats to lords and dukes, and are very badly educated; in short, they are sorry for us. I have heard very remarkable statements made about England at political gatherings, and equally remarkable statements placarded on bannerettes carried in processions. Often have I heard the remark made in all sincerity by American carpenters that "they have never come across a good hand straight from the old country." They acknowledge having known English carpenters who have developed into good hands in America, but none that came over as such. In Manchester I have heard joiners and foremen declare that the American carpenters who were brought over to work during the great strike of thirteen years ago were no good at all, and had to return when the strike was over; indeed, some had to return before the strike was over. The American carpenter is better tamed than the English one. He will stand more abuse and can be driven better; in other respects he is much the same as the British carpenter. We are not regarded in the same way as other foreigners are over there; the name of Smith commands full money, while that of Sorenski or Boisvert is rated at a shilling a day less. Many Sorenskis apply to the Government to have their names changed on the ground that they are unpronounceable. Boisvert saves himself the trouble and expense by simply calling himself Greenwood. *Bois vert* in French is green wood in English.

Such, gentlemen, is our position in the land of the almighty dollar. Self-righteousness is not an amiable virtue even when justified, and in pointing out holes in other people's coats I certainly do not wish to encourage the erroneous belief so prevalent with the masses in all countries—that they are the finest people on earth, possess all the virtues, that the rest of the world are nowhere compared with them, and are fit only to be ridiculed. Many ugly things may be said with perfect truth about ourselves.

The Incorporated Church Building Society voted grants during 1899 for thirty-four new churches and twenty-five mission or temporary churches, besides six grants for rebuilding churches and twenty-eight for enlargements. The total cost of the proposed church works was £292,217, and the Society's grants came to £16,035, in addition to £665 for mission buildings.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Iron Skylight.

RAVENS COURT PARK, W.—ROWTON writes: "Will you please give details for an iron skylight in a corrugated iron roof. The size would be, say, 3ft. long and 2ft. wide. The slope is 1 in 10, no boarding, purlins of angle iron 5ft. apart. I should like a section showing all flashings. The roof would be flat, and the light half-way up."

The accompanying illustrations show section of roof and skylight, plan of framing, and plan

of flashing. The corrugated sheet on upper side of skylight should be wide enough to lap well over the sheets passing down the sides.

HENRY ADAMS.

Sicilian Marble for Baths.

CHARING CROSS, W.C.—BATHER writes: "I shall be glad to have some information as to the use of Sicilian marble for the sides and bottom of a swimming bath. Does it keep clean without much trouble, and does it keep its colour?"

Replying to "Bather's" enquiry, if my memory serves me rightly, Sicilian marble is used for the bottom and sides of some old baths in Whitechapel or Bethnal Green, and no doubt elsewhere. I was not favourably impressed with its appearance. The material is porous and easily stained, and harder to clean than a glazed surface. As it can be obtained in large slabs, few joints are necessary, and these can be made very close. With the aid of black or dark-coloured marble strips and small squares, a fine broad effect may be obtained, but these are its only advantages as far as I know. Undoubtedly glazed tiles form the best surface. They look clean, and are easily kept so.

A. SAXON SNELL.

A. SAXON SNELL.

Clerks of Works Association.

SEAFORTH. — PETER THE GREAT writes : " What is the name and address of a clerk of works association (if any) which finds positions for men of practical experience in the building trade as clerk of works ? "

If our correspondent will apply to the secretary of the Clerks of Works Association of Great Britain, Carpenters' Hall, E.C., he will obtain all the information he requires, as this association requests architects requiring clerks of works to communicate with them. In reply to a further query of our correspondent, it is rather a large order to ask us to give the ground and gallery plans of a Wesleyan church to seat 1,000 persons, together with an organ chamber, choir accommodation, minister's vestry and church parlour, even though the question is only asked "to ensure safety for the gallery." On page 77 of our issue for March 7th last there is an illustrated reply to a query about supporting a church gallery, which will doubtless be of use to our correspondent.

Books on London Building Public and Health Acts.

RICHMOND.—METRO writes: "I should be glad to know whether there is a cheap and trustworthy work on the London Building Act, 1894; also a similar book dealing with the Public Health Act, 1875?"

The following are good books on the subjects mentioned: "London Building Acts, 1894-1898 (B. T. Batsford, 5s. 6d.); "The London Building Act, 1894," by Alexander J. David, B.A., LL.M. (Crosby, Lockwood & Sons, 3s. 6d.); "The London Building Act, 1894, and the Amendment Act, 1898," by W. Russell-Griffiths, LL.B., and Francis W. Pember, M.A. (W. Clowes & Sons Ltd., 12s. 6d.); "Public Health Act, 1875" (B. T. Batsford, 6s. 3d.).

Dam for Small Streams.

ULVERSTON.—J. T. S. writes: "I shall be glad to know the best and cheapest way of forming a dam to a stream, as shown by the enclosed sketches (not reproduced): A wall of stone built in clay or concrete has been suggested, with a bank up each side for fish to climb. Depth of wall to be about 6ft. or 7ft."

In order to make a good job, it would

be necessary to choose a dry season or to temporarily divert the stream. The retaining wall for path having been put in, the centre wall across stream should be commenced, but it should be of clay puddle, not stone. On each side any available material may be put down to form banks, and the sloping surfaces may be protected by stone pitching set by hand. The top of the puddle wall must also be protected by stones of good size, and on the down-stream side the stones or apron must be carried well forward to prevent scour undermining the dam.

HENRY ADAMS.

THE SURVEYORS' INSTITUTION.

PROFESSIONAL EXAMINATIONS, 1900.

Professional Associates.—The following student candidates have passed the examination for the Professional Associateship:—Bartlett-Morle, D. A., London; Bingham, W. R., London; Blyth, H. K., Bristol; *Brierley, H. C., Monmouth; Bruzard, G. J., London; Burman, W., Kiverton Park, near Sheffield; Chesterton, S. J., London; Cope, G. H., Broxton, Chester; Cramphorn, C. H., Chatham; Davidge, W. R., London; Davies, J. G. M., Skelton, near Penrith; Dellschaft, A. H., London; Dudley, R., Neath, Glamorgan; Earle, J. W., Woolton, Lancs.; Ellis, R. L., London; Fletcher, H. V., Penhurst, Tonbridge; Foster, W., London; Fox, W., Bournemouth, Hants; Freuer, W. S., King's Lynn, Norfolk; Goodbody, F. A. S., Bristol; Hall, C. A., London; †Hancock, H. S., jun., St. Austell, Cornwall; Harlow, W. W. R., London; Heal, H. G., Southsea; Hider, S. W., London; Hinchcliffe, J. H., Leeds; Hooper, A. E., Andover, Hants; Houghton, W. C., Woodford Green, Essex; Howes, A. B., London; Johnson, F. J., Erith; Jonas, H. D., Whyteleafe; Jones, A. B., London; Kiskingbury, A. V., London; Knibb, F. C., London; Lanham, L., London; Lisney, H., London; Mackintosh, W. S., Kingston-on-Thames; Perks, H. E., Bedford; Pitt, P. S., Cambridge; Robinson, J. A., Kirkby Lonsdale; Schofield, P., Preston, Lancs.; Stead, E. J., Preston, Lancs.; Stockings, A. P., London; Stone, C. F., Wigton; Strudwick, F. E., Bromley, Kent; Taylor, W. H., Nuttall, Nottingham; Timbrell, A., Tavistock, Devon; Tonson-Rye, J. R., Crookstown, co. Cork; Turner, V., Wakefield, Yorks.; Wachter, T. B., Canterbury; Walton, L. M., Bexley, Kent; Withycombe, J. G., St. Albans; Young, K. J., London.

The following non-student candidates have also passed the examination for the professional associateship:—Arnold, H. H., Norwich; Banks, E. J. S., London; Basley, H. P., Bickley, Kent; Baylis, A. E., Canton, Cardiff; Beasley, T. C. P., Harston, Grantham; Bettger, H. A., London; Blatherwick, C. W. R., Wye, Kent; Bliss, T. C., Ealing, W.; Brimacombe, C. S., London; Browning, E. G., London; Bryan, A., Nuneaton, Warwickshire; Bully, H. W., Exeter; Burr, H., Rushden, Northants; Charles, M. T., Walsall, Staffs.; Clarke, E. S., London; Clegg, R. L., London; Clunn, T. H. G., Bath; Cobb, H. A. W., London; Cochrane, W. J., Hetton-le-Hole, co. Durham; Cook, F. C., Nuneaton; Cooke-Yarborough, O. F., Doncaster; Cooper, G. A., London; Corbett, J. R., Greenheys, Manchester; Crockatt, H., Llandudno; Cullen, F. V., London; Daubney, C. A., London; Dunstall, H. H., London; Evans, R. M., Hanley, Staffs.; Foster, W. H., Litherland, near Liverpool; Fox, E., Bournemouth, Hants; Gale, H., Goring-on-Thames, Oxon; Goodlife, S. J., Cambridge; Grove, R. T., Harpenden, Herts; Hall, A. W., London; Hewitt, F. T. B., Market Harborough; Hilliard, H. N., Chelmsford, Essex; Hindmarsh, R. F., Newcastle-on-Tyne; Hipsley, F. W., Sutton Coldfield; Kaye, H., Sheffield, Yorks.; Kelly, A. R., London; Kemsley, N. B., Woodford Green, Essex; Lawley, G. F., London; Leigh, V. S., London; Living, C., jun., Plaistow, Essex; Maggs, L., London; Martin, J. P.,

Brighton; Mills, A. E., London; Mills, D., Westbourn, Ipswich; Morgan, E. A. D., St. Asaph, North Wales; Newman, W. P., London; Parker, H., Buxton, Derbyshire; Perrins, G. L., Preston, Lancs.; Pinson, G., Solihull, Warwickshire; Plant, W., Leicester; Pole, A. C. R., Basingstoke; Pugh, E. S., Wolverhampton; Rafferty, H. V., High Wycombe, Bucks.; Rafferty, P. C., Birmingham; Roberts, J., Aberystwith; Saunders, E. W., London; Shettle, E. G., London; Thorold, J. E., Grantham, Lincs.; Tiffin, T. E., West Hartlepool; Townly, R. S., Hastings; Upsdale, A. R., London; Walsh, F. L. M., London; Walter, T. J., Bournemouth, Hants; Waters, F., Norwich; West, S. H., Ealing, W.; Whatley, E. J., London; *Wheldon, M. L., York; White, B. W., London; Whitten, G. J., Tenby, South Wales; Williams, R. E. H., Enfield Wash, N.

Irish Candidates.—Bourchier, C. J., Tullamore; Gibbon, E. A., Waterford; Stewart, H. P., Dublin.

Scottish Candidate.—Mather, J., Brodick, Arran.

Fellowship.—The following Professional Associates have passed the Fellowship Examination in Division IV:—Addiscott, H. H., London; Arno, S., London; Baverstock, H. B., Godalming; Birch, F. J. L., Melpash; Bridgewater, C. J. B., London; Burgess, H. H. P., London; Carr, H. F., Waltham Abbey; Chesterton, F. S., London; Chichester, R. H., Cheswardine, Market Drayton; Cole, J. T., Torquay; Cowper, W. S., Sittingbourne; Cutler, G. A., London; Dawson, G. C., Nuneaton; Dunlop, D. O., Manchester; Ellis, A. R., Shalford; Goadby, H., Twickenham; Goodman, A., London; Gripper, J. E., Battle; Hayward, T. W. A., Sudbury; Healing, O. J., London; Hinks, H., Croydon; Hood, T., Halstead; Hope, A. E., London; Jennings, F. P. D., Bournemouth; Johnston, R., London; Jones, D. P., Llandaff; Kirby, E. F. J., Liverpool; Kirk, J. W., London; Latham, A. T., London; Leather, W. B., Leeds, Yorks.; Lomas, A. D., Manchester; Luker, D., London; Matthews, D. S., London; Mumby, E. F., London; Nockolds, A. G., Saffron Walden; Parry, R. F., Bishops Waltham; Pinder, R., London; †Pineger, J. R., London; Ridley, P. E., London; Robbins, W. F., Hastings; Sanday, W. H., Uxbridge; Scrivener, J. C., Caterham Valley; Shufflebotham, J. H., Taunton; Sly, W., Whitehaven, Cumberland; Smith, J. A., Knutsford; Smith, P. W., London; Southorn, C. H., Leamington Spa; Stimson, E. F., London; Terry, F. W., York; †Thomas, C. J. H., London; Thurgood, A. E., Guildford; Tremlett, W. W., Nuneaton; Type, M. O., Moseley, Birmingham; Watson, D. A., Shirburn, near Wallingford; Wells, F. B., York; West, H. J., Leytonstone; Wilkinson, P. N., London.

Irish Candidates.—Goff, J. C., Kingston, co. Dublin; O'Brien, D. E., Limerick; Wood-Martin, H. R., Dublin.

The following candidates have passed the direct Fellowship Examination in Division V:—

Kelly, J. G., Pontefract, Yorks.; Marriott, A. S., Dewsbury, Yorks.

Thirty-six candidates, not included in the above list, who passed the examination in Divisions II. and III. as a whole, failed in their typical subject and are referred back to their studies in the subject. Nine candidates who passed the examination as a whole in Divisions IV. and V. also failed to pass in their typical subject, and are referred back to their studies. Eleven out of forty-two candidates in the various divisions who came up for re-examination in their typical subject have failed again this year. It is open to all these fifty-six candidates to offer themselves again for examination in their typical subject in March, 1901.

* Driver Prize and Penfold Silver Medal, 1900.

† Crawter Prize, 1900. ‡ Penfold Gold Medal, 1900.

The Ancient Monuments Protection Bill, which was recently dealt with in our columns, has passed its second reading in the House of Lords.

Keystones.

Lowestoft Town Hall has been enlarged at a cost of £3,500.

The Theatre Royal, Chatham, was destroyed by fire on Wednesday last. The theatre was a new one (it was only opened last July) and the damage is estimated at £30,000.

Ayr Town Hall.—At a special meeting of the Ayr Town Council on Thursday last it was decided to build a new town hall on the old site at the cost of the rates, in accordance with the plans of Mr. J. K. Hunter, architect, of Ayr.

A new School at Pontlottyn has been built at a cost of £2,800. Messrs. James and Morgan, of Cardiff, were the architects, and Messrs. W. Williams and Sons, of New Tredegar, were the contractors. The school has accommodation for 270 children.

A new Church at Creswell, Mansfield, has been built from designs by Mr. Louis Ambler, of London, the contractors being Messrs. Bowman and Sons, of Stamford. An organ that has cost £275 has been erected by Messrs. Nicholson and Lord, of Walsall.

New Park for Wallsend.—A new park, covering 13½ acres, will be opened at Wallsend on Whit Monday. It is situated near Buddle Board Schools and the North Road, and has been designed by the surveyor, Mr. G. Hollins, under the superintendence of Mr. A. E. Raisbeck.

A new Primitive Methodist Church at Loden, Norwich, has been built from designs by Messrs. Kerridge and Sons, of Wisbech. The contractors were Messrs. Chaston and Grimson, of London, and the stonework was executed by Mr. A. W. Perfit. The total cost was about £1,000.

Mr. Edward J. Hanson, a member of the firm of Dunn, Hanson and Fenwicke, architects, of Newcastle-on-Tyne, was found on Thursday last inside the office lavatory, the door of which had been locked, with two bullet wounds in his throat. He was removed to the infirmary in a critical state.

Sir Arthur Blomfield's Grave.—A tall cross of Celtic character, raised on steps and ornamented on its upper part by delicate strap ornament, has been erected over the grave of the late Sir Arthur W. Blomfield, A.R.A., at Broadway, Worcestershire. It has been executed by Messrs. Harry Hems and Sons, of Exeter, under the superintendence of Messrs. C. J. and A. C. Blomfield, M.A., sons of the deceased.

Pier Pavilion at Bournemouth.—On Thursday last the Bournemouth Town Council discussed the question of building a pavilion at the shore end of the pier to comprise a large building to accommodate 1,700 persons, refreshment rooms, &c. Strong opposition was offered on the grounds that the present Winter Gardens Pavilion should remain the chief place of entertainment, and that the new building would also injure the present pier approach. Ultimately the surveyor was instructed to prepare plans for the approval of the Local Government Board. The scheme is estimated to cost from £20,000 to £25,000.

Discovery of a Staircase at Durham Castle.—Recently, while workmen were engaged repairing the floor of a room in the Castle at Durham, a portion of a finely preserved newel staircase was brought to light. The existence of such a staircase has for a long time been suspected, but nothing has been done, of late years at least, to discover its whereabouts. It is supposed that the staircase now discovered was used as a means of communication between the upper and lower portions of the Castle, and that it was built by Bishop Hugh Pudsey, and used before the present black oak staircase was erected by Bishop Cosin. At present a section of between 13ft. and 14ft. has been unearthed, and it would appear that outlets from the staircase had been obtained to different parts of the Castle.

R.I.B.A.

THE ART OF THE LATE PROFESSOR
COCKERELL, R.A.

A MEETING of the Royal Institute of British Architects was held on Monday evening, Mr. E. A. Gruning, vice-president, occupying the chair. The minutes of the previous meeting having been confirmed, several members, attending for the first time, were formally admitted, amongst them being Misses Ethel Mary Charles and B. A. Charles, the first lady members of the Institute. Mr. J. M. Brydon, vice-president, then read his paper on the art of Professor Cockerell, of which the following is a summary:—

He opened with a brief survey of the architectural influences at work during the early years of the present century. Professor Cockerell, he said, formed a connecting link between the old order and the new. He came when the men and the methods of the Renaissance were gradually being worked out. Under Robert Adam English Classic had become somewhat emaciated, and though Chambers still upheld the principles of the Renaissance as practised in its best days the letter of its tradition was now being neglected, if not altogether lost sight of. The English Renaissance School, from Inigo Jones to Chambers, had never attempted to hide its buildings behind pseudo-Classic fronts, or to palm off Greek and Roman temples for Christian churches. Its use of Classic details was always subservient to the purposes of its buildings, and its buildings to the requirements of the time in which they were built. On the other hand the "Revivalists" seemed to have a principle that modern purposes should be made subservient to foregone architectural styles. This distinction must be borne in mind for a proper appreciation of the efforts made by such men as Cockerell and Barry towards the elucidation of the true principles of design. These two men, conscious of the hopelessness of the path the Revivalists were pursuing, followed each the bent of his own genius, the former reverting to the Italian of the Renaissance, the latter carrying his Greek culture and refinement into the every-day work of his time. Of the notable architects of the time none had a stronger grasp of Greek detail or used it with more sympathetic expression than Playfair, or a deeper knowledge of the principles of Italian art than Barry; Cockerell, at once a great artist and a scholar, drew his inspiration from both sources, combining the adaptability of the Italian with the refinement and grace of the Greek, while through it all ran the impress of his own individuality. Even Cockerell was not altogether proof against the battle of the styles then in full swing, as witness his Gothic work at Harrow Schools and Chapel and at Lampeter College.

Cockerell was born in 1788, and was the son of Samuel Pepys Cockerell, a well-known architect, and surveyor to the East India Company. He was educated partly at Westminster School. His professional training was begun in his father's office, and he afterwards entered Sir Robert Smirk's office as an assistant. When in his twenty-second year he began his foreign studies, in the pursuit of which he twice thoroughly explored the mainland of Greece and its islands, returning again and again to Athens. Then he visited Sicily and Italy, staying at Naples, Florence and Rome. On his way home he spent some time in Paris, returning to England after an absence of seven or eight years, four of which were spent in Greece. He studied incessantly, made notes and sketches and restorations, many explorations of temples and other buildings, and particularly of Greek sculpture, and generally stored his mind with the knowledge he afterwards gave to the world in his famous lectures and books and still more famous works.

At the age of thirty, he commenced his first real work, the Literary and Philosophical

Institution, now the Freemasons' Hall, at Bristol, a design marked by that sense of proportion and purity of detail which became such marked characteristics of his later works. After some additions to Harrow School, and Bowood for Lord Lansdowne, came his first work of primary importance, Hanover Chapel, Regent Street. Here he distinguished himself at once by his originality of plan, design, and refinement and delicacy of detail. Though hampered by difficulties of site the result was an artistic triumph, a veritable revelation in the adaptability of Greek art to modern purposes. It is to the lasting shame of all concerned in the transaction that this work of a great master should have been sacrificed to the craving after ground rents.

His next commission was the National Monument on the Calton Hill, Edinburgh, a work in which he was associated with Playfair, of Edinburgh, and which, as originally conceived, was to be a reproduction of the Parthenon, and on the same magnificent scale. The work, unhappily, was never completed.

As Cockerell's practice increased, he engaged with more or less success in several competitions, amongst others for the Cambridge University Library and Museum. This competition practically failed and had to be done all over again. Ultimately, Cockerell's design was chosen, but was never fully carried out—a matter greatly to be regretted, judging by the north wing, the only portion actually erected. The Westminster Insurance Office, now the office of the "British Medical Journal," in the Strand, erected about this time, was the first of a notable series of buildings for commercial purposes which, perhaps more than any others, show the master's individuality. It has all the characteristics typical of its designer which were developed with such success in the Sun Fire Office in the City, and the Liverpool and London Insurance Buildings at Liverpool, and the Bank of England building in the same city. While seeking his inspiration from Greece rather than from Italy, while clothing all with the mantle of Greek refinement rather than with the luxury of the Renaissance, he never forgot he was designing buildings for modern purposes. He bestowed much study on the masonry of his façades; the size and proportions of the stones were made to play a subtle part in the harmony of the general design. His angle quoins and rusticated courses were cunningly devised to assist the general scale and expression of his elevations. As an object lesson showing how these features may be employed with reticence, yet with power, Mr. Brydon commended to students the careful study of the Dale Street front of the Insurance Buildings at Liverpool, one of the finest pieces of design in modern Classic. The recent alterations at the Sun Fire Office, Threadneedle Street, were to be deplored. The original work might have been left alone to speak for itself, and the additions designed in harmony with it; but, as carried out, the whole of the proportions of the building had been altered.

Another worthy monument of Cockerell's skill and genius, the Taylor and Randolph buildings at Oxford, was won in a competition and carried out during the years 1841-46. Though not a large building, it has a quiet dignity. It is the architect's work at his very best. One feels the grace of its Greek refinement in proportion and in detail, the appropriateness of its sculpture and carving, the judicious contrast of plain surface and richness of effect, with all the wealth of knowledge and skill, and yet that reticence of design which goes to make an architectural work of the highest merit.

Two public buildings of the first importance left unfinished at the death of their architects were completed by Cockerell—viz., the FitzWilliam Museum at Cambridge, commenced by Basevi, and of which Cockerell completed the hall and staircase, and St. George's Hall, Liverpool, the noblest monument of the Classic revival in England, designed by the younger Elmes. Of the latter building, upon which Cockerell laboured for nearly seven years, the magnificent decorations of the great hall, the stateliness of the courts, the Doric beauty of the northern entrance hall,

and the elegance of the circular concert-room on the first floor are all due to his genius.

Mr. Brydon then referred to Cockerell's designs for the Royal Exchange and the Houses of Parliament. As regards the Royal Exchange, the successful competitor, Sir William Tite, considered it one of the most remarkable works of art in connection with architecture he had ever known. Tite and Cockerell carried out the London and Westminster Bank in the City, in collaboration—they were the only competitors for the work, and at Tite's instance they acted as joint architects. The exterior is marked by Cockerell's hand.

Besides being an accomplished and a brilliant architect, Cockerell was a learned archaeologist and much of a sculptor. He drew the figure with remarkable power and expression; he managed to grasp the broad monumental style of the great Greek age.

Numerous honours were conferred upon Cockerell in his own country and abroad. He held the Chair of Architecture at the Royal Academy for seventeen years, was surveyor to St. Paul's Cathedral, was the first to receive the Royal Gold Medal for Architecture, and was the first Architect President of the Institute. He died in 1863, and was buried in St. Paul's Cathedral, the fabric of which had been under his care for forty years.

A discussion followed, in which Dr. A. S. Murray, Messrs. H. H. Statham, W. M. Fawcett, R. Phené Spiers and E. A. Gruning took part; a vote of thanks proposed by Dr. Murray and seconded by Mr. Statham being passed to Mr. Brydon.

DUBLIN PUBLIC HEALTH.

THE mean yearly death-rate in Dublin from all causes during the ten years 1890-99 was 29.5 per 1,000 of the population. The report of the Committee appointed by the Local Government Board for Ireland to enquire into the cause of this high death-rate clearly establishes the existence in Dublin, in an exceptional degree, of several conditions which are wont to be associated with a high rate of mortality. Especially noteworthy among these are the insanitary circumstances in which a considerable proportion of the population of Dublin lives. It has to be borne in mind that the proportional amount of poverty in Dublin is very large, so that these unfavourable conditions associated with the houses of the poor are widely spread throughout the city.

The Committee recommend as the result of their enquiry:—That in tenement houses water should be laid on to each floor, and separate sanitary accommodation should be provided for at least every two families. That no stables should be let as dwellings without a licence having been first obtained from the Corporation. That schemes for housing a large number of the labouring and poorer classes should be taken in hand at once, and if suitable sites cannot be obtained in the city powers should be given to the Corporation to acquire sites outside the city. That all streets, lanes and alleys in the city, whether in charge of the Corporation or not, should be scavenged by them. That all dust bins should be covered and emptied into covered carts, and that the contents of dust bins from tenement houses should be collected daily. That an additional "destructor" be provided and the existing one enlarged. That the regulations as to dairy yards and cow sheds be most rigorously enforced. That an abattoir be provided for the south side of the city, and the number of private slaughter-houses should be gradually reduced. That more wash-houses and swimming and reclining baths be erected in several parts of the city. That in future all persons appointed by the Corporation to act as sanitary inspectors should be specially fitted for the discharge of their duties. That all work now done by the Public Health Department, which properly is of an engineering or architectural nature, should in future be under the control of the borough engineer or the city architect.

EXTRAS AND OMISSIONS IN BUILDING CONTRACTS.*

By E. H. BLAKE.

PARTIES to a building contract are liable to many risks and responsibilities. The building owner or his agent has to consider, among many other things, the following possibilities:—(1) Excess of cost over amount of contract; (2) failure of the builder, with the attendant inconvenience; (3) delay in completion through weather, strikes, &c., often involving considerable pecuniary losses. On the other hand, among the possibilities which the builder has to consider are:—(1) Strikes, with changes in the price and efficiency of labour; (2) alterations in the price of materials; (3) failure of the building owner; (4) accidents and liability under the Workmen's Compensation Act; (5) impracticable plans; (6) inaccurate quantities; (7) penalties for non-completion to time. A reasonable contract is one which reduces the element of risk to either party to the smallest possible amount, and places all such liabilities as those mentioned above on the right shoulders.

Of all the contingencies attendant on building contracts the matter of extras and omissions is one of the most difficult in the final settlement. The knowledge of the building owner or employer in reference to the details of the work is, in almost every case, limited. A very small percentage of clients thoroughly understand the technicalities of plans and specifications. The position of the architect should be, therefore, and generally is, that of adviser and confidant, rather than that of servant to the employer. Contracts occasionally curtail his customary powers. It should be noted, however, that there is legally no authority implied to him in reference to the ordering of extra works.

The necessity for very complete and stringent conditions of contract cannot be too strongly urged. The position of architects under contracts is not always satisfactory. There is frequently a lack of confidence between the architect and builder. No matter how fair-minded the architect may be, he is always liable to be regarded as having more or less bias towards his employer, the building owner. It has been said that when confronted with two alternatives—one, that of submitting to the employer a heavy bill of extras (sometimes to some extent attributable to the architect's negligence), or, on the other hand, that of pleasing his employer at the builder's expense by cutting down the bill of extras—an architect is apt to be found very human. The conditions of contract should provide that none but work done on written orders signed by the architect should be recognised as extra work, and the contractor's priced bill of quantities, or a verified copy of it, should be deposited for use as a schedule in valuing all extras or omissions. Every point on which it is possible that a misunderstanding may arise should be carefully considered and thoroughly threshed out before the signing of the contract. This careful consideration is rapidly becoming a matter for the surveyor rather than for the architect. Such a practice cannot be too strongly recommended. Only in the process of taking off the quantities can all the points of uncertainty be eliminated.

Quantities,

where taken off by the architect, are often prepared in a more or less haphazard way. The practice of quantity surveying is not one to be dabbled in. There is no matter of opinion about the quantity of labour and materials in a certain piece of work. Either there is so much of this or that, or there is not. Therefore, either the work is correct or it is incorrect. Trifling inaccuracies frequently result from insufficient description or omission of detailed labours. The question as to whether the quantity surveyor is guilty of bad faith with the builder and building owner in the case of inaccurate quantities depends very

much on the position and mode of appointment of the quantity surveyor. It would be obviously unjust to say he was liable under such circumstances as those in the well-known case of *Priestly and another v. Stone*, where the quantities were taken out from unfinished drawings and delivered to the architect who afterwards materially altered the drawings, wrote the specification apparently regardless of the bill of quantities, and submitted the drawings, specification and original bill of quantities as a basis of tendering. It was held by the court that there was nothing in the nature of a contract between the quantity surveyor and the builder, and there could therefore be no liability. In the course of the judgment in this case Mr. Justice Stephen recommended the quantities being made part of the contract. But notwithstanding this decision, it is still customary to consider the quantity surveyor morally liable to the builder to some extent for inaccuracies. On the other hand, the question arises—Is the building owner justified in receiving work for which he has not paid? For if the quantities are insufficient in some particular, the contract price will also be insufficient.

A process which cannot be too strongly condemned as unfair to all parties is that of issuing bills of quantities for the purpose of tendering, but repudiating any responsibility for their accuracy, saying that a few days or a week will be allowed the contractor for the purpose of verifying them. Anyone acquainted with quantity surveying knows that this means beginning again. There should be no confusion as to the

Meaning of the Term "Extras."

These can be defined as all works not included in the contract, for which instructions have been given. Omissions may arise when the quantities form part of the contract, or by agreement between the parties when the quantities do not form part of the contract. In the latter case there ought always to be a clear understanding at the time that the value of the omitted work will be claimed by the architect in the final settlement.

Where the quantities do not form part of the contract, works indispensably necessary to complete do not come under the head of extras, even though they be not mentioned in the contract, shown on the drawings, or described in the specification. In support of this I would briefly mention the well-known cases of *Sharpe v. San Paulo Railway, Thorn v. Corporation of London*, and *Bottoms v. Corporation of York*. The second case, *Thorn v. Corporation of London*, arose out of the construction of Blackfriars Bridge. The contract provided for building the piers by the aid of a special form of caisson, which was minutely described. This proposed method of construction was found impracticable, and though the builder was thereby put to considerably greater expense, he was held not to be entitled to extra payment since he had undertaken to erect the bridge complete.

The case of *Bottoms v. Corporation of York* appears perhaps more unfair. The plaintiff contracted to construct some brick sewers, but had not previously acquainted himself with the nature of the subsoil. He found that the design of the engineer to the corporation was quite impracticable, for after construction the sewer was again and again crushed in, only to be reconstructed by the contractor. Payment was refused on the ground of non-completion. The Court of Appeal held that, although the Corporation of York had treated the plaintiff very unfairly in the matter, they were under no obligation to pay until the contract was completed, which, according to the design in the contract, was a matter of impossibility.

Many other instances might be given, but the effect of all is similar. Again and again has it been held by the courts that plans, specifications, &c., are in the nature of information supplied to the builder for the purpose of enabling him to tender, but that there is no implied warranty either of their accuracy or practicability. It is unreasonable to expect the contractor to possess technical knowledge superior to that of the engineer or architect.

These cases indicate that the law requires amending, and that contracts must be meanwhile made to provide against legal defects. This is best done by making the quantities the basis of the contract. The contractor will then be liable to do only the work for which he has tendered a price, and the employer will only be entitled to receive value for which he has agreed to pay. I have already stated that a contract for a complete work includes everything indispensably necessary to the completion of it. I would add that it is immaterial that such works are omitted from the specification or drawings, or that the drawings are impracticable, or that certain things are understated or miscalculated. It is also immaterial that such works are omitted from the quantities, whether they form part of the contract or not.

While dealing with the subject of

Impracticable Plans

it should be noted that when the quantities are not part of the contract authority given to the architect as to the ordering of extras does not give him power to order as extras work indispensably necessary to make such plans practicable. Should an architect order as an extra, or certify for as such, anything indispensably necessary to the contract, unless such certificate is a final and conclusive one, neither the employer nor the architect is liable for payment to the builder, who should know that the matter was within the meaning of the contract, and that he would have been liable for breach of contract if it were omitted.

The position of an architect with regard to extras is practically this. He must, if not authorised to order extras on behalf of the employer, obtain the latter's instructions in reference to any additional work which may be contemplated before sanctioning its commencement. If the contract provides that no extra work is to be undertaken without the architect's written order, such order should be given before the work is commenced, and no certificate for payment should be issued in regard to any extra work executed without such written orders. Further, where the quantities are not part of the contract, he must not incur liability on the part of the employer by ordering as extras, or certifying for payment as extras, work which is indispensably necessary to completion. In reference to the architect's authority to order extras the question of custom arises. The almost universal custom is, I think, to regard the architect as the employer's agent in the fullest sense of the word. The next point with which I would deal is that of

Written Orders for Extras.

The law and practice on this matter is very clear. Though the conditions of contract require all orders for extras and omissions to be in writing signed by the architect, there is yet a way in which the builder can obtain payment for work executed in direct opposition to such a condition, or on the verbal orders of the architect. The contract may contain a clause giving the architect the power to grant a final and conclusive certificate, and, if he includes in such certificate amounts in respect of extra work unauthorised in the manner agreed upon, the employer is bound to pay. Under any other circumstances the employer is not liable in the absence of written and signed orders as required by the conditions of contract. The mere verbal promise on the part of the employer or his agent to pay for any extra work, or to adjust matters by a cutting-down process in other directions, is of no value whatever.

Again, if the contract defines extras and omissions as only such additional or varied work as may be authorised by the architect in writing, any extra work ordered by the employer, either verbally or in writing, must be regarded as in the nature of a separate matter quite outside the contract.

It may be noted incidentally that the measuring surveyor has no authority in respect of performance under the contract.

The granting of a final and conclusive certificate by the architect is a matter requiring great care. Even though the architect may

certify as extra, work that has never been done, or which was indispensably necessary to the completion of the contract, the employer has no remedy and must pay, unless he can prove negligence on the part of the architect or collusion and fraud on the part of the architect and builder.

Time for Extras.

The next point to which I would devote attention is the question of time during which extras may be ordered. To come under the heading of extras to a contract, any additional work must be done under orders issued during the execution of the contract. All work executed under orders issued after the completion of the contract must be regarded as the matter of a fresh transaction altogether, and cannot be dealt with as extras to the former contract.

Another question which has sometimes to be considered in dealing with extras is that of suggestions to the employer by the builder. If any such suggestions are not made with a clear understanding that they will involve extra cost, the builder cannot recover from the employer the cost of carrying them out. Neither can they be treated as extras to the contract except by an express agreement to that effect.

There is sometimes a tendency on the part of contractors to take an unfair advantage of the delay caused by the ordering of extra work. The matter of delay is one which should be left entirely in the architect's hands. He should have full power to extend the time if desirable owing to the addition of work to the amount originally contemplated. In reference to the payment of liquidated damages for failure to complete by a certain day, it was held by the Court of Appeal in *Dodd v. Churton* that if the delay was consequent on orders for additional work, the contractor was exonerated from the payment of damages unless there was an express agreement to the contrary.

The practice of incorporating the quantities in the contract and providing that the work to be done shall be that contained therein is strongly to be recommended.

In conclusion, I would again urge the necessity of fairness to both parties to a contract. It must not be forgotten that the essence of a just contract is exchange in strict equity, of cash for kind. There is still, unfortunately, among some architects and contractors a feeling of natural enmity. There should be no foundation for such a feeling, and there can be no doubt that the thorough investigation of the matters which are intended to form parts of the contract, and the elimination of all uncertainties by the surveyor before the signing of the agreement, has had much to do with the improvement in the relations between architects and contractors.

Bleak House, Broadstairs, is for sale, the price asked being £3,000. So far, no purchaser has come forward, the reasons alleged for this being that the house would require a considerable sum to make it habitable. Failing a private purchaser it is suggested that the house should be acquired as a Dickens Memorial and Museum.

New Baths for St. Pancras.—At a cost of £95,000, the Vestry of St. Pancras are about to erect, in the Prince of Wales Road, new baths and wash-houses, standing upon an area of about 33,000ft. There will be four swimming baths, 130 slipper baths, and a spacious and well-equipped public wash-house. Refreshment rooms and three club rooms will be provided. The men's first-class bath will be arranged as a public entertainment hall in the winter, and will be capable of seating 1,200 persons. The ceiling of this hall will be a new departure in the case of swimming baths. In order to ensure good acoustic qualities, the usual lantern skylight will be omitted and the ceiling will be arched, with the light on each side of it instead of at the top. Externally the facings will be of red bricks with terracotta dressings, and the buildings will be lighted by electricity. The foundation-stone was laid last Thursday.

ART METAL WORK.*

By NELSON DAWSON.

IT seems necessary at the outset to make some apology or explanation concerning the title of the subject we are now to consider—art metal work. The phrase is only partly mine, the word "art" being originally placed in inverted commas, which considerably nullifies what is not agreeable. We do not hear of art woodwork or art stonework. Let us have art certainly, and metal work by all means, but let each keep to its proper place, and, like good neighbours, they will be all the better friends for so doing. There is often in an expression of this kind, unfortunately, a modicum of truth, or a slight indication of a truth, that justifies existence, which makes it so much the more difficult to treat. Added to this is the fact that the objectionable phrase has by custom come to convey a certain idea, which thus becomes difficult to express in any other way, and, willy-nilly, one is almost bound to fall back on it. On this occasion I am not sure that the omission is not, to some extent, fortunate, as in making this explanation I am enabled to give a hint of the direction in which I should like to proceed.

Art work is not unfrequently "useless" as opposed to useful work, and it is more the latter than the former that I propose to speak about. The aim of all good work, call it art or what we will, is in its relation to humanity, its usefulness or uselessness, and life being short, and our capabilities limited, we have to make a choice, as there is hardly time to consider both sides. Quite frankly I confess that such an object as an ostrich egg in silver gilt setting, with a cherub and any amount of German sixteenth-century scrollwork, does not interest me at all, because its influence on men and women is nil—even when placed in a glass case in a museum; therefore I do not desire to waste time in talking about it. But a piece of armour or a drinking mug, a coffer lock, a chalice, or a pastoral staff that is beautifully made is of the greatest importance, because it is a necessary part of humanity in a way, and bears on human progress.

Greek Work.

Since thinking about the matter I have tried to remember if the Ancient Greeks talked about art metal work, or if any author since in writing about the work of their times referred to it in that way; but I do not recall a single instance. Yet, as we know, the Greeks were by no means backward. I have seen modern metal bedsteads with the word Birmingham writ on their brazen foreheads that beyond doubt would be referred to as "art metal work," and I feel no less sure of having seen (possibly only in imagination) an ancient Greek bedstead of bronze of beautiful shape and workmanship to which one would never dream of applying the expression, for it would be sacrilegious; to mention art in connection with it would be to imply that there were those who were not aware of the fact, which would be insufferable. Therefore it may be concluded that the more the word art is used the less art we shall find. "Quod erat demonstrandum."

Yet we may have heart of grace, and be sure it is quite possible that a bedstead may be made even in Birmingham (though this is a hard thing to say), even made of cast iron and brass; and if only the right person with the right mind make it, it shall be good. Birmingham is nothing, the bedstead is nothing, and the metal, rare or common, is nothing, but the mind and hand of the maker is everything.

To begin then, at the very beginning, it occurred to me that I might find something of interest concerning metal work in Dr. Schliemann's interesting account of his "Excavations in Mykene Ancient Troy." The work is of great antiquity, for in one place the doctor on opening a tomb makes a complaint that some gold cups must have been taken out by a despoiler—at a time anterior to B.C. 486.

But the date of the work itself has been guessed at 1500 or 1000 B.C., which seems a fairly remote time at which to commence. It happens that most of the things he discovered are of gold; the bronze and copper articles were either oxidised beyond recognition, or had become spoiled through the action of the funeral fires. With few exceptions these things are of the most beautiful design and workmanship, without any of the accuracy and precision so much looked for in these days. But the point is that these gold cups and ornaments thus buried with their late owner were the things the people lived with—of everyday use. It was the metal work of the moment, designed and made by the artists and goldsmiths for quite practical purposes.

If we praise this gold work of the very remote period, of which naturally not much remains, what shall we have left to say about the next period, when metal work flourished exceedingly and the Greeks in making the objects of everyday use reached a point in excellence of craftsmanship and beauty of design that has never since been attained. Of this period, which, roughly speaking, was about 400 B.C., and in which bronze was the metal that was almost universally used, our own British Museum has a very choice collection of examples. To call such work artistic, as we use the word, is inadequate. The spirit that breathes in it is too high for anything short of religious fervour, and with the exception of the earliest form of Gothic, it may be doubted if even in the history of the Christian Church the human art which thus flourished in the heathen era was ever actuated by such high promptings. If it were, one can only note that the standard reached was so much lower.

Probably too little is known of the Greek people who did this work and their times to form an opinion as to how it was done, or the conditions that surrounded its production. A writer of the time in speaking of the celebrated shield that was made for one of the heroes says that it was of bronze plates beaten on layers of bull's hide—a description that occurs more than once, and points to the fact that the metal-workers were skilled in using the hammer. "Well nailed" is another favourite expression, and if for nail the word rivet is substituted, a likely enough change, the beaten sheet work is put more forcibly before us, as opposed to cast work which would not require riveting. Not that these things matter very much, as we are not seeking to learn the secrets of the work so much as to consider the spirit of it, and, if possible, to become imbued with some small portion ourselves.

That religious enthusiasm would account for all things connected with religious observances is probable enough, but it is remarkable that the same feeling and high standard were carried into the objects of continual domestic use; and even from a commercial point it is difficult to imagine how such objects could have been produced at a cost that enabled the average person to buy them. With the bronzes of figures, busts, &c., the case was different, because they were probably bought by the rich only, as a luxury, and their cost was of less importance. As a matter of interest these latter concern us less, as their sculptural qualities outweigh those of the craftsman.

The series of hand-mirrors form a subject that should be treated alone. (Mr. Dawson here dealt with them at length.)

Another class of beautiful objects of this early Greek period are the bronze cistas or boxes, of which we possess several choice specimens. It is not clear what they were used for, though it would be some domestic purpose probably.

The tall lamp-stands must have been a very noticeable feature in the Greek house. About 4ft. high, they generally consisted of a delicately fluted column with a moulded circular top and base. This column stood on a three-way foot, often consisting of three legs of animals, or shapes approximating them, all modelled and finished in the most beautiful manner. At the top came a three-way arrangement of branching arms, on each of

* Summary of a paper read before the Applied Art Section of the Society of Arts on May 8th, 1900.

which a lamp might be hung, and surmounting the whole was not unfrequently a bronze figure or group about 6in. high.

There is much more that we ought in duty to notice, but we certainly must not omit the very beautiful specimens of Greek armour. Being a fighting nation, armour must have formed a very valuable asset in the property of each man, or of the nation at large. But to think of an army clothed in metal work of such wonderful make as we see in the British Museum is hardly credible.

One other phase of Greek metal work claims attention, and that is the coins, especially of about the fourth to the second century B.C. As metal work they come distinctly under the head of sculpture; the metal-worker having but little hand in them. They were modelled in the first instance, and then either moulds made for casting or dies for stamping. But here, as before, all thought of workmanship or authorship is lost in the all-engrossing appreciation of their extreme beauty.

The Roman Period.

In the period following the one already glanced at it is less easy to find material, though not easy to say why. If we referred to the other as the Greek period, we may with equal reason call this the Roman period of the world's history, although in both cases there were other phrases of art concurrent with them. Finding so much to consider in the Greek period, the following one suffers by contrast possibly, or it may be that it requires more closely looking into than we are now doing. But, at all events, one does not feel able to find much metal work material. There is, however, some really fine Roman silver work—dishes, cups, platters, &c.; these are not so noticeable for their shape as for the way in which the decoration has been added.

In other metal objects the Romans were fond of inlaying fine silver patterns in bronze, and also niello work. But it was in architecture that the Romans were chiefly interested—they were great builders. And architecture, being the mother of all the arts, it is not remarkable that their enthusiasm was absorbed before it reached such a minor art as metal work is supposed to be, except in so much as it was required for the purposes of their building, ornamental or otherwise; and it seems likely that owing to classical architecture requiring so little assistance from metal work there was much less done in this direction in consequence. What was done was principally in bronze, that metal being much more in accord with classical feeling. It is difficult to imagine a pair of strap-iron hinges, like those so freely used in the later Gothic period, on the heavily-panelled doors of one of the Roman temples. One can see there nothing but bronze hinges, or even less than that, a pin of solid bronze at top and bottom of the door working in stone sockets. Thus the metal work would be entirely concealed and of no account whatever. Inside the temples there were, doubtless, bronze tripods and other objects which were required for religious purposes, but these things hardly appear to have received the thought and care that was bestowed on the stone or wood work.

At the end of the time of the Greeks, the Romans, being then a young and vigorous people, overcame them, and carrying off their best artists to Rome trusted to found there a school of art that should continue and rival what had gone before. We see now that the method adopted was fatal to a separate artistic existence. The Romans did, however, become an important development, and in a measure brought to a conclusion the severe and thoughtful work of earlier times. In a smaller way perpendicular work of our own country was to thirteenth century Gothic what Roman Classic was to Greek Classic.

From Classic to Gothic.

The next step was from the classical work to the Gothic, which was a great leap and one that affects metal work very much. We shall not follow it closely here, though it would be interesting enough. The two phases seem to be so widely opposed that it is not easy to see how the Gothic could follow on the heels of the Classic in so short a space of time, a

century or two only elapsing between the ending of the one and the commencement of the other. It has always appeared to me, without going deeply into the question, that it was only owing to the interruption of Byzantine art that there is any relation at all, and that otherwise, there would have been needed a perfect revolution or casting off of all previous ideas in passing from heathen to Christian art. As it was, the Byzantine merging process allowed a smoother transition, much of the old state of things being retained and added to the new.

As a people the Byzantines seemed less concerned with architecture and building than with the decoration and beautifying of buildings, and this, perhaps, accounts for a revival in what is called, for convenience, the minor arts, and amongst them metal work.

From the early Greek Church of Byzantine times to the Reformation in this country the Church was one of the great patrons of our craft, and the museums are full of the fine examples that were the result of this encouragement.

From Byzantium to Italy, omitting Rome, where classical feeling was too strong for any other form to get much footing, from Italy still westwards to France and England the wave of Gothic spread, growing and developing into varying forms until all the then civilised world was affected. From the severe and simple forms of what we find in Italy it grew into the gorgeous work that was done in France in the twelfth and thirteenth centuries, and about the same time in England.

I am not sure how far Gothic architecture in Italy was associated with the enlarged use of forged ironwork, but in France and England the two things came at the same time; notably in the hinges to the church doors, of which those on the great doors of Notre Dame, in Paris, from probably one of the richest examples in the world. So rich are they that they suggest an imitation in this hard material of the wealth of ornament that overlaid the walls of the Christian mosques of Byzantium, and in carved stonework so much covered the later Roman buildings.

Hinges which grew from the plain knuckle to an iron band clamping together the thick slabs of oak which formed the door grew very elaborate as time advanced, and when carpentry had improved, and the iron bands were no longer necessary, they were retained as ornaments.

It seems, from the metal-worker's point of view, that the end of the mediæval period concludes the important phases of metal work that occurred in the world's history, but in our own country there were one or two lesser phases that are of no little interest. One of these was the English silver work of the seventeenth and eighteenth centuries, which, now we are able to look back on it as a whole, we can see was characteristic and individual.

In the middle of the eighteenth century we were, like other nations, under the pseudo-classic influence, and the fashion ranged between the delicate mouldings of the Adams to the coarse acanthus leaves and flutings of the worst time of the Georges. Here, again, is an example of how fashion or phase operates on an art or craft. In the more delicate mouldings used at the Adams' time, casting was the only way to reproduce them—cast solid and then minutely chased. On the other hand, the bold acanthus leaves were better rendered by bumping up in sheets from the back and then finishing from the front; and these two branches of metal work, although one would hardly think it, would require different workmen, the one branch of work being so opposed to the other.

There was besides this silver work in our country during the last two centuries a very interesting and creditable phase of forged iron work which resulted in many objects of domestic use—trivets, fire-dogs and backs, fireirons, &c., and on a larger scale the railings in front of houses and surrounding gardens. It must not be thought that it was in England only that such work was going on; this is referred to as being characteristic and worthy of note. Spain was rich in metal-workers also, and some very fine and costly ironwork was produced there. In France, too,

there was much metal work being done, and in each case it is marked with the character of its time and country. One ought not to omit Germany, where smithing and much other metal work flourished, although, as a rule, German metal work lacks that simplicity that our admirers in other work.

Present-day Metal Work.

Now, as to our own time, what shall we say about it? We have been critical enough to past times and people, and the mote in their eyes, but what about our own metal work and our own eyes? The things with which we surround ourselves in our homes, the grates and fenders, fittings on doors, gas chandeliers, and electric light fittings, our knives, forks, and spoons—will they ever be found in a museum or will they be referred to lovingly before learned societies, as we do now in regard to the ancient works? I should like to be as kind to ourselves as possible, but I feel unable to speak in their favour.

And yet we might have good metal work; there are our iron bedsteads, and a hundred other objects that are open to good treatment, without making them too costly. The list would be a long one if we went through everything that we have around us that the metal worker might improve.

The truth is that no list is needed. The corrective should not be in the shape of by-laws and rules so much as a clean and wholesome desire springing up in the minds of the people at large for something better. There have been some signs of the grey before dawn latterly, and the keener appreciation of old furniture, for instance, is an inkling of the right state of mind. This in time should become an appreciation of good work generally, and I should like to think of metal work in particular. As I say, it would be idle to specify what things might be improved with advantage in metal work, but it is not unreasonable to think that there may be a time to come when the hand and brain of the individual craftsman shall not be of less concern than a good gas engine, and when people will value work with personal thought and care in it.

Engineering Notes.

Messrs. E. H. Shorland and Brother, of Manchester, are supplying their patent Manchester stoves with descending smoke flues to the fever hospital at Bradford.

County School, Bala.—The warming of this building has been placed in the hands of Messrs. John King, Ltd., engineers, of Liverpool, who are now installing their latest improved hot-water heating apparatus.

Acetylene Gas in a Lincolnshire Church.—The vicar of the parish church at Surfleet has been granted a licence by the Spalding Rural District Council for the storage of calcium carbide for making the acetylene gas by which the church is now lighted.

Ayr Electric Tramways.—It has been decided to proceed with the construction of an electric tramway system for Ayr, extending from St. Leonard's Church to Prestwick, a distance of nearly three miles, at a total cost of £57,000.

Electric Lighting Extension at Lincoln.—A Local Government Board enquiry was held on Thursday last into the application of the Lincoln Corporation to borrow £6,000 for electric lighting purposes. This sum is to provide cables, and to lay down cables in the southern part of the city at the extremity of High Street, where there is a probability of the demand for the current increasing.

Widening of Tweed Bridge, Peebles.—The bridge over the Tweed at Peebles is being widened at a cost of about £26,000. Messrs. Dickson and Clyde are the contractors. The bridge was originally built in the fifteenth century, and in 1834 it was widened to about 20ft. By the present operations another 20ft. will be added, while the approaches on each side will be straightened and greatly improved. The engineers are Messrs. M'Taggart, Cowan and Barker, C.E., Glasgow.

Builders' Notes.

Fire Protection at the British Museum.

—The authorities of the British Museum have decided to adopt a system of hydraulic pressure upon all the fire mains of the institution as an additional precaution against fire. By the adoption of this system a pressure of water of enormous force will be obtained by the mere turning of a couple of wheels, and the necessity for the fire engines which are at present on the roof of the museum will be obviated. This system of hydraulic pressure is already in use at Somerset House and the National Gallery, and about a week ago the apparatus at the former institution was submitted to its annual test with the most satisfactory results.

Separation Walls under the L.B.A.—

At Westminster last week Mr. Williams, district surveyor for South Kensington, summoned Mr. William Downs, of Hampton Street, Walworth Road, under the London Building Act of 1894 for erecting a building of more than 1,000 superficial feet area, at 61, Brompton Road, intended partly for trade and partly for residential purposes, with separation walls of less thickness than 8½ in. Mr. Williams said that very serious disasters had occurred on large buildings jointly used for trade and occupation, and the statutory thickness of not less than 8½ in. for separation walls was now insisted on. Mr. James Morley, for the defendant, said a great deal was paid for the freehold and 9 in. walls took up too much space. Fireproof materials had been used throughout in construction, and the builders, &c., from the first, had resisted the contention of the district surveyor. The wall in dispute could not, according to the Act, be deemed a cross-wall, because it was not intended to be carried to the highest storey. After a very long legal argument, evidence was given by a deputy district surveyor that other district surveyors invariably tried to get 9 in. separation walls, but in several cases had given way and accepted 4½ in. walls, rather than press the matter to a judicial decision. Mr. Horace Smith decided in favour of the defendant, but said he would willingly grant the district surveyor a case.

A Curious Compensation Case.—

The recent case of *Clarke v. Nichols* was an appeal from the Judge of the Clerkenwell County Court, who non-suited the plaintiff in an action under the Employers' Liability Act. The action had already been tried in the Brentford County Court, where the Judge, taking a strong view in favour of the plaintiff, told the jury they should find for him. The jury, however, found for the defendant. At the Clerkenwell County Court the jury found for the plaintiff. The facts were these:—The plaintiff was an engineer, whose duty it was to attend to a mortar mill. The tyres of the rollers becoming worn and loose, the plaintiff was directed by the defendant, his employer, who was a builder, to remedy this defect by driving wedges between the tyre and the roller. While he was doing this one morning some lime, which in the ordinary use of the mortar pan had found its way in between the tyre and the roller, was forced out and struck the plaintiff in the eye, injuring his eyesight. The action was brought under section 1, sub-section (1) of the Employers' Liability Act, 1880, the plaintiff alleging that he had been injured through a defect in the plant owing to the negligence of the defendant. The judge left three questions to the jury:—(a) Was there a defect in the plant? (b) Was that defect due to the negligence of the defendant? (c) Was the injury caused through the defect? The jury answered all three questions in the affirmative and gave a verdict for the plaintiff for £45, notwithstanding which the judge non-suited the plaintiff, holding that there was no evidence on which the jury could find that the accident was due to the defect in the plant. The plaintiff appealed, and the Court allowed the appeal. The workman was engaged in remedying a defective machine when he was injured and there was evidence on which the jury might find that the injury happened through the defect.

London County Council.—At last week's meeting of the Council the statement of the Finance Committee submitting the annual estimates was considered. This showed that the principal increases were the main drainage, which required an additional £26,335, and the Technical Education Board, £10,000. The estimated expenditure was £2,765,834. The assessable value of London is now £37,549,521, the City accounting for £4,571,454 of that amount. Mr. Wallace Bruce, chairman of the Committee, said they had this year to provide for a very large expenditure of capital in connection with the new street from Holborn to the Strand, the Strand improvement by the removal of the Holywell Street houses, the tramway extensions and conversion to electric traction, and also the several housing schemes which had been sanctioned by the Council. Owing to the recoupment which they should receive in a few years' time in the shape of ground rents and profits, much of this expenditure would eventually prove remunerative, and the result of the whole would be merely a small annual charge on the rates; but the immediate effect was a very considerable increase in the charge for interest on debt. For total ordinary services the debt of London was equal to a little more than one year's ratable value, and compared favourably with that of Manchester, Birmingham, Leeds, Sheffield, and other smaller towns, while for the extraordinary remunerative services, water, gas, electric lighting, tramways, etc., the capital debt of London was very small indeed, being only 6½ per cent., or say one-fifteenth of one year's ratable value, as compared with four years' ratable value in the case of Manchester, 2½ years' in that of Birmingham, and 1½ years' in the case of Liverpool. The architect had devoted much time to planning the most economical dwellings for the working classes, and they now knew by experience what was the highest price they could afford to pay for land on which they intended to build dwellings so that when they were occupied there would be no charge on the rates. Land in the central districts of London was three times too costly to be used for that purpose; that was to say, those who required this land for offices, warehouses, workshops, or factories were willing to pay three times the price that the Council could afford to pay for housing purposes. In some of the recent purchases by the Council of land on which to re-house persons displaced by the new street from Holborn to the Strand, as required by Act of Parliament, the price paid to a willing seller had been far more than three times the housing value. The Reid's Brewery site in the Clerkenwell Road cost £200,000, and it had been necessary to write it down to £45,000 as its housing value, and the Herbrand Street site, a small piece of vacant land in Bloomsbury, cost about £40,000 and was written down to £7,000.—After discussion, the estimates were passed.—The Improvements Committee reported that the First Commissioner of Works had consented to the erection of the Gladstone memorial on a site to the west of St. Clement Danes Church.

Public Improvements at Sudbury.—On Wednesday last a public inquiry was held by Major-General H. D. Crozier, R.E., into an application of the Sudbury Corporation for borrowing powers for the purposes of public and private street improvement (£7,000), for sewerage works (£3,500), for water-supply works (£2,000), and for purposes of electric lighting (£650).

The Operative Masons of Dunfermline have struck. Some time ago the employers proposed to reduce wages to the extent of a penny per hour and to abolish certain conditions favourable to the workmen, which were stipulated for in previous annual agreements. The men refused to agree to these terms and the employers agreed to modify the reduction of wages to a halfpenny per hour. At a meeting of the men it was decided, by a narrow majority, not to accept this compromise. The wage for the past year has been from 9d. to 9½d. per hour, and now the masters offer from 8½d. to 9d.

Masters and Men.

Tamworth Painters' Dispute.—Mr. G. B. Askwith, barrister, who was appointed by the Board of Trade to arbitrate upon the application of the Tamworth painters for an advance of ½d. per hour has given his decision against the application.

The Workington Joiners' Strike has been settled after eight weeks' duration, the men agreeing to accept ½d. per hour advance on the wage of 7d. instead of the 1d. asked, and a considerably modified code of rules has been drawn up.

The Pudsey Joiners' Strike has been Settled. The masters have given the advance asked for, that is, from 7d. to 8d. per hour, and the men have consented to a modification of those union rules against which the greatest objection was urged.

Building Trade Strike in Stockholm.

—The employers in the building trade in Stockholm have begun a general lock-out of their men. The lock-out, although directly affecting 5,000 workmen only, will, it is stated, throw 20,000 men out of employment.

The Whitehaven Painters, who struck work recently for an advance of wages from 7d. to 7½d. per hour, have returned to work on the understanding that the increase asked for will be given on June 2nd next. This settlement was brought about by the intervention of Mr. J. T. Moffat, architect, representing the masters, and Councillor Thackley, on behalf of the men.

Strike of Bricklayers at Barrow-in-Furness.

—The bricklayers engaged by Messrs. Gradwell and Company in the erection of the new Technical Schools at Barrow-in-Furness have objected to masons setting the terra-cotta front of the building. They claim the work as bricklayers', because terra-cotta is made of clay. Unless the masons are withdrawn the bricklayers have decided to cease work, under instructions of the Bricklayers' Executive Council. The masons, on the other hand, claim the work as theirs, and there is every prospect of the rupture affecting all the building operations in Barrow.

The Bricklayers' Dispute in the Potteries.

—As a result of a conference between the employers and operatives in connection with the strike of bricklayers in North Staffordshire and Newcastle the following terms have been offered by the masters: "The workmen to start work at an advance on present wages of ¼d., that is, 8½d. instead of 8¼d. per hour, the question of a further advance to be submitted to an umpire to be agreed on by both sides, and if any further advance is given by him it should date from the day the men commenced work." The masters had previously offered the ¼d. advance, and they submit that this further concession of allowing the men to commence work at the advance and then to arbitrate as to a further advance can be accepted by the operatives as a fair basis of settlement honourable to both sides.

Trade in April.—The Board of Trade states that employment in the building trades has still further improved, and is good in most branches; the percentage of unemployed union members among carpenters and plumbers at the end of April was 2.2 compared with 2.6 in March, and 1.3 per cent. in April of last year. In the furnishing trades employment has continued to improve in most branches and is now good; the percentage of unemployed union members at the end of April was 1.3, compared with 2.4 in March and 0.8 per cent. in April, 1899. Employment in the engineering and metal trades has remained good; the percentage of unemployed union members in this group of trades at the end of April was 2.4, compared with 2.2 per cent. in March and also in April, 1899. Of fifty-two fresh disputes in April, twenty-one occurred in the building trades, four in the mining and quarrying industries, and six in the metal, engineering and shipbuilding trades.

"BUILDERS' JOURNAL" SHILLING FUND.

ANOTHER GOOD LIST.

WE expressed a hope last week that our readers would send in the small amount then required to reach a total of 3,000 shillings, and so enable us to send a cheque for £150 as the contribution of the BUILDERS' JOURNAL and its readers towards the fund for erecting homes for discharged soldiers. We are very glad to be able to announce that the sum we regarded as the best for which we might hope has not only been reached but considerably exceeded, and our fund now amounts to 3,425 shillings. Whether the announcement of the closing of the list has induced some who have kept back their contributions to delay no longer, or whether the stirring events of the past few days have moved some of our readers to seek a useful outlet for their patriotic feelings, it is certainly a fact that we have received during the past week a larger

list until Monday, June 2nd, when a cheque for the total amount contributed will be sent to the treasurer of the Building Trades' Gift.

Last Week's Matinee.

The distinguished audience at Drury Lane Theatre on Tuesday afternoon last week witnessed a performance, or rather a series of performances, in which the pick of the theatrical profession took part. The matinee was given to provide for the up-keep of the proposed Homes of Rest for Disabled Soldiers, with which our fund is so directly concerned; but we regret that the name of Mr. Edwin O. Sachs, the architect of the Homes, who has done so much to forward the work, was not mentioned on the programme of the entertainment nor in the newspaper articles.

The curtain first rose at 12.30 and finally fell shortly before seven; so the performance (which was organised by Mr. Arthur Collins and Madame Cellini) was long enough. The house was draped in white, relieved by the red cross and garlands of flowers. The Princess of Wales, the Duchess of Fife, Princess Victoria of Wales, and Princess Victoria of Schleswig-Holstein occupied the Royal box during the latter hours of the performance. Prices varied from 100 guineas for a box to half-a-guinea for

dressed in khaki, Mr. Huntley Wright and Miss Kate Cutler provided excellent music and humour. After a second taste of the Gaiety attraction—the Messenger Boy himself, Mr. Edmund Payne, appearing with Miss Katie Seymour in their Mummy Dance—the audience had the great treat of renewing acquaintance with Mr. Tree's "Midsummer Night's Dream" (scene 4, Act I.), in which Mrs. Tree, Miss Julia Neilson, and Miss Dorothea Baird took part. Mr. Rutland Barrington, Mr. Courtice Pounds, and Mr. Walter Passmore appeared in "Trial by Jury," Miss Florence St. John taking the part of the plaintiff, and Lady Bancroft and Mr. W. S. Gilbert being upon the stage in the speechless parts of the Associate and his wife. The bridesmaids included Miss Phyllis Broughton and Miss Decima Moore. Conspicuous jurymen were Mr. W. H. Denny and Mr. Harry Lytton, while Mr. J. Comyns Carr, Mr. Haddon Chambers, Mr. Lionel Monckton, and Mr. Sydney Grundy figured as learned counsel; the crowd in court was composed of well-known society ladies. In "A Patched-Up Affair," a play in one act by Miss Florence Warden, Mr. George Alexander, Miss Fay Davis, and Mr. H. B. Warner won much applause. Then there came the wonderful harlequinade, as performed at the Nellie Farren benefit, the performers including Miss Nellie Farren herself (who was affectionately cheered), Miss Katie Seymour, Mr. Edmund Payne (clown), Mr. Arthur Roberts (Police-Sergeant XX.), Mr. Herbert Campbell, Mr. Harry Nicholls, Mr. Tom Thorne, Miss Louie Freear, Mr. Sydney Brough, Miss Kitty Loftus, Miss Marie Lloyd, Mr. Charles Hawtreys, Miss Evelyn Millard, Miss Violet Vanbrugh, Herr Meyer Lutz, and a host of other favourites. Afterwards came a military spectacle, with Mr. James Fernandez as Wellington and Mr. Julian Cross as John Bull, and this was followed by the final tableau from "The Soldiers of the Queen," as produced at the Alhambra. There were many other interesting items in the performance, the gigantic nature of which will be apparent from the list of prominent actors and actresses given. The financial results of the matinee cannot yet be exactly ascertained, but it is estimated that about £3,000 will result from Tuesday afternoon's work. This money will go entirely to create a fund from which the general up-keep and the structural and decorative repair of the Homes shall be assured for all time.

The members of the building and allied trades of Birmingham, having been invited to join in the movement, are giving their support to the scheme by organising a local fund. A meeting, at which this decision was come to, was held at the Grand Hotel, Birmingham, last Monday week, under the chairmanship of Mr. F. G. Whittall (president of the Birmingham Master Builders' Association). Mr. Whittall stated that the Master Builders' Association had met the workmen, who were unanimous in their wish to assist; the labourers' representatives said that their men were willing to give 1s. all round, which would amount to £150; other workers said they would try to give a contribution of 1s. 6d. per member, and altogether from the trade in Birmingham they were likely to obtain £700 or £800. Messrs. J. Matthews (Carpenters and Joiners), J. Ball (Mill Sawyers), H. Duckett (Plasterers), A. Dye (Stonemasons), T. Bradshaw (Builders' Labourers), E. Carter (General Labourers), and G. Speaks (Bricklayers) have been elected to co-operate with the employers to conduct the work of the local executive, and representatives of the other trades have been requested to join them.

The Executive of the Building Trades' Gift wish to express their high appreciation to all concerned in this entertainment, and also to those concerned in the one organised by the Leicester Master Builders' Association, who, by means of a patriotic concert, which was subscribed to by the builders and workmen of Leicester alike, brought together the sum of £170 for the benefit of the payment of labour in connection with the erection of the Homes. The Executive further wish to call attention to the well-

THE MATINEE AT DRURY LANE THEATRE ON MAY 15TH.

addition to the fund than in any previous week since our list was opened.

Towards this most gratifying result the splendid efforts of Mr. Spencer Bush, of Coventry, have in no small degree contributed. This gentleman, who sends a cheque for £20 13s., has evidently made a thorough canvass of the builders and architects of Coventry, who, we are glad to see, have responded most liberally. This shows what one energetic worker can accomplish, and we only regret that we have not as able and enthusiastic a collector for our Shilling Fund in every town in the kingdom.

Extension of Time.

The notable response of the past few days suggests that there may yet be further contributions to the good cause to be extracted from the pockets of our readers and their friends, and we have decided to keep open the

a balcony seat. It was a huge and delighted audience, among whom wandered irresistible saleswomen of flowers from Nice (presented by Lady Pirbright) and of a souvenir programme enriched with drawings by Mr. Phil May, Mr. Caton Woodville, and Mr. Dudley Hardy. "Comrades in Khaki," a sketch in one act by Mr. Charles H. Brookfield, figured first upon the many-featured programme, being followed by Mr. Frederick Upton's short stories, and a new patriotic song, "Our Gallant Boys," by Mr. Charles Magrath, with Sir Walter Parratt conducting the orchestra. In the "letter scene" from "The Rivals," Mr. Cyril Maude played Acres with his usual skill. Mr. Lewis Waller recited Mr. Rudyard Kipling's "The English Flag." Mr. Fred. Wright, jun., as Captain Pott in "The Messenger Boy," together with ten Gaiety ladies, scored a great success with their popular song, "They're all after Pott," and the dance that follows. "A Gentleman in Khaki" proved to be a delightful musical farce, in which Mr. Haydon Coffin,

organised efforts that have been made in Birmingham and district on behalf of the Building Trades' Gift, and to the arrangements which have been taken in hand throughout Yorkshire, and they wish to announce that printed matter to facilitate the work, such as posters and the like, will be gladly issued to those in authority in other provincial districts who may probably wish to follow the excellent example of those centres which have already taken up the matter.

The Gladstone Statue in the central lobby of the Houses of Parliament, by Mr. F. W. Pomeroy, was unveiled on Saturday.

The Fixing of Rosettes on Buildings.—The clause in the Liverpool Corporation Bill giving compulsory powers to affix rosettes for the electric tramway service on private property having been dropped, an alternative clause is being considered. It has been suggested that this should provide for the erection of a rosette without the consent of the owner only in cases where an order had been made by the magistrates upon evidence showing a rosette at a particular point to be essential to the service.

Proposed Reconstruction of the Theatre Royal, Birmingham.—It is proposed to pull down this theatre and the adjacent buildings covering the area bounded by New Street, Lower Temple Street, Colonnade Passage, and Stephenson Street, and to construct a new theatre, several shops, and probably an arcade. The total cost of the undertaking is estimated at about £120,000, of which about £25,000 or £30,000 would be spent on the new theatre. The scheme would afford an opportunity of setting back the building line for the purpose of widening the street, an improvement which is much desired in that part of New Street.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"One may express an idea with anything that makes a mark on a surface."—J. F. MILLET.

Bishop Marshall's Tomb.

ON the north side of the choir of Exeter Cathedral stands the altar-tomb of Henry Marshall, Bishop of Exeter, of which we give measured drawings this week by Mr. G. J. F. Hookway. This tomb, which is of Purbeck marble, is partly covered by a Perpendicular screen which surrounds the choir. The tomb is exceedingly well carved, and is a very interesting one, dated about 1206. When comparing the two opposite sides a great difference is noticed in the character and finish of the work, which seems to suggest that the sides were executed by different men at different places. The effigy is well preserved and is almost intact; it is well carved, the crozier being as tall as the figure, and of a very simple form. Henry Marshall, brother of William, Earl of Pembroke, and Marshal of England, was selected for the See of Exeter, which became vacant in 1191. During his episcopacy, which commenced February 10th, 1194, he completed the Transition Norman Cathedral, enlarged the choir by doing away with the apse, and added four bays with aisles and retro-choir. Another very important addition made to the church by him was the lady chapel, not as it is at present internally, but of the same dimensions as now, occupying, probably, the site of Leofric's Cathedral. He also made some additions to the nave, consisting of the north porch, St. Edmund's Chapel, and the great south-east doorway leading into the cloisters. He also built the transeptal choir chapels and introduced the pointed vaulting. These were some of the larger works which he did, but there are still remains in different parts of the cathedral, which show that he was a great builder and added largely to the beautifying of the cathedral. After governing his church for about twelve years and a half, Bishop Marshall died on October 26th, 1206.

Doorway, St. Albans Abbey.

WE give this week also a measured drawing of the doorway in the north choir aisle of St. Albans Cathedral, also by Mr. G. J. F. Hookway. This fine perpendicular doorway was pierced through the wall in the fifteenth century to give an easier access from the eastern chapels to the sacristy, and also for the other buildings on the north side of the church. A few years later the door was blocked up and another inserted immediately to the eastward in order to make a greater convenience for the townspeople attending the services in the transepts and choir. This inserted doorway was partly constructed from a fourteenth-century arch and portions of the holy rood screen. When the abbey was "restored" by Lord Grimthorpe in 1875 the doorway was removed and the window lowered to its original level. The arcading on either side of the doorway dates from about 1260.

The Housing Bill.

THE Government Housing Bill was read a second time last Thursday, Mr. Robson's amendment, asserting the need for wider reforms, being withdrawn. The measure, though good as far as it goes, is a very small one, and we are not sanguine enough to expect that it will mitigate the evil of overcrowding to any great extent. The most hopeful feature, however, about the whole business is the fact that Parliament has at last shown a disposition to tackle the problem in earnest. The discussion showed that there are many members on both sides of the House who fully realise the gravity of the situation, and will not allow the present inadequate Bill to stand as the final expression of their sense of responsibility towards the unhoused and the ill-housed. The suggestions made during the debate were many and varied, and it is not to be supposed that all of them can be carried out; but the

matter for congratulation is that there is evidently a consensus of opinion as to the need for more drastic reforms in the future.

Wanted, an Object Lesson.

ONE of the most interesting proposals was that of Sir Robert Reed, who suggested that the time had come for prohibiting the erection of more workshops in the centre of London. It is undoubtedly the fact that the competition for sites for workshops adds greatly to the difficulty of obtaining suitable sites for housing schemes. But it is not difficult to imagine cases in which serious injustice might be caused by compelling manufacturers to establish their works outside the precincts of the city. At the same time it would undoubtedly be a great gain if factories and workshops could be transplanted into country districts, for obviously the workers would follow, and so relieve the congestion in the cities. This, of course, is a great point in the proposals of the Garden City Association, who seek, by methods which have been fully explained in our columns, to establish model townships by voluntary co-operative action on the part of manufacturers and others. If one such township could be established we should have an invaluable object lesson when next proposals for dealing with the housing question were placed before Parliament. Whether the experiment proved a complete success or not, we should have at hand the materials for a comparison. It would be possible to compare the lot of the workers, as regards wages, housing, &c., with their former condition when they dwelt in the city, and also to show from the evidence of the manufacturers how the migration to the country affected their business.

Ruskin and Baden-Powell.

As is generally known Colonel Baden-Powell is a very clever draughtsman, and possesses the rare faculty of drawing with the left hand as well as the right. Mr. Harold Begbie's recently published life of the hero of Mafeking explains the genesis of this accomplishment. It seems that Ruskin had something to do with it. As a child Baden-Powell was very fond of drawing maps and animals, and somewhat alarmed his mother by persistently holding his pencil or paint-brush in the left hand. "One day Ruskin called when this doubt was in her mind, and to him the question was propounded. Without a moment's hesitation he counselled the mother to let the boy draw in whatsoever manner he listed, and together they went to find the young artist at his work. In the play-room they discovered one brother reading hard at astronomy, and 'Ste' with a penny box of water-colours painting for dear life—with his left hand. 'Now I'll show you how to paint a picture,' said Ruskin, and, with a piece of paper on the top of his hat, and with B.-P.'s penny box of paints at his side, he set to work, taking a little china vase for a model. Both the vase and the picture are now in the drawing-room of Mrs. Baden-Powell's London house. The result of Ruskin's advice was that B.-P. continued to draw with his left hand, and now in making sketches he finds no difficulty in drawing with his left hand, and shading in at the same time with his right."

Home Handicraft.

LORD Grey recently presided over a curious meeting at Newcastle-on-Tyne. It was to consider the advisability of forming a county guild for the encouragement of home handicraft in Northumberland villages. Mr. C. W. Mitchell stated the objects of the guild, one of which was to "stimulate an interest in art among all classes by supplying direction in such handicrafts as will add to the beauty of the home." Lord Grey said he believed the effect of work such as they proposed should be done, would be the establishing of centres in the country and the encouragement of the population to come into the country. The object of the craft schools would be to bring the people somewhat nearer to the state of society pictured by Mr. William Morris, when all the artists should be workmen and all the

workmen should be artists. He did not think anybody could dispute that it was desirable to encourage art and a desire for beautiful things. He thought it could not be disputed that Northumbrians, who excelled in many directions, were yet lamentably deficient in an artistic sense. They were also lamentably unconscious of their terrible shortcomings in this respect. A resolution was adopted declaring that it was desirable to form a handicrafts guild for Northumberland with the objects stated by Mr. Mitchell. It was also decided to appoint a Council, consisting of those who had expressed sympathy with the object of the meeting, to take such steps as may be desirable to promote the purposes of the guild. It will be interesting to note what results are achieved, whether the idea will prove an Arcadian dream or a practical and profitable revival of handicraft in the north. Let us hope the latter, for such a revival is sorely needed.

Underground Tunnelling and Settlements.

AN article on "The Central London Railway and the Subsoil Water," recently published in the "Lancet," raises the question as to what influence the construction of underground railways is likely to exert upon health and property in their vicinity, owing to the probable alteration in the level of the subsoil water, the Central London Railway being taken as an example. Avoiding dogmatic assertions it discusses possibilities. In order to do this it first considers the geological structure of the soil surrounding the tunnel and shafts. The original physical geographical features of the district are glanced at to prove the more or less saturated condition of the soil. A brief description of the line follows. The results of these arranged facts are summarised and tend to show not only the possibility, but the probability of a considerable alteration in the level of the subsoil water having been produced by the construction of the tunnel. The result of this would be the settlement of house property in certain districts and an altered condition of humidity likely to affect disadvantageously the health of the occupants of the houses at the lower levels. It concludes by suggesting that before underground railways are more extensively adopted discussion is desirable that the evils here pointed out may be avoided. A brief account of the geology of the London basin is appended. The editorial remarks give support to the article and point out the possibility that the settlements which have been known to have taken place may also have affected the sewers and the gas and water mains in like manner with the houses, thereby causing risk of pollution of the sub-soil water, or even the water mains, by in-suction.

The New Laboratory at Richmond.

A FEW brief particulars have already been given of the new physical laboratory which is to be erected, under Government control, in the Old Deer Park, Richmond. Some details of the building are now forthcoming. It will consist of two buildings, which will be placed, not adjoining the present observatory in the centre of the park, but on a strip of ground enclosed for the purpose alongside the boundary between the park and Kew Gardens. This site, about fifteen acres in extent, commences immediately at the rear of the archery ground in the Kew Road, and runs westwards towards the Thames. At the end nearest the road and to the Kew Gardens Pagoda—which will itself be utilised for purposes of the laboratory—will be erected a somewhat extensive one-storey building, devoted to the testing of commercial samples. At the far end of the site, and adjoining one corner of the Queen's Cottage grounds, there will be a smaller two-storey building, which will be used for the purpose of carrying out a variety of magnetic and other physical experiments, success in which imperatively demands seclusion and freedom from disturbance, either physical or electrical. A very small number of persons will be employed at either of these buildings; the work will all be carried on with perfect quietness and within doors, and there will be no smoking chimneys or other dis-

figuring appendages. The motive power required in the testing house will be supplied in the form of electricity and by cable from outside the park. There will, in fact, be nothing of a character to disturb the bird life or other attractive features of the adjoining gardens, and in their architectural features the buildings, designs for which will be prepared by the Office of Works, will be as unobtrusive as possible. The portion of the park which it is intended to use is at present in the occupation of the Mid-Surrey Golf Club, but it is not expected that the enclosure will involve any serious interference with the courses.

New London Buildings. It is interesting to note what a number of improvements are being effected in London at the present time, either by the erection of new buildings or the widening of streets, or by both. We have already given particulars of some of the improvements, but it will be well now to look at them as a whole. To begin with, the removal of the block of buildings between Parliament Street and King Street at Westminster, in order to clear a site for the new Local Government Board Offices, designed by Mr. J. M. Brydon, has changed the aspect of a locality probably as well known to visitors as any within the metropolitan radius. On the eastern side of Whitehall the ground upon which will stand the new War Office buildings, designed by Mr. William Young, has been cleared, and here also work in connection with the foundations is in progress. The two new buildings will very materially improve the appearance of the roadway from Trafalgar Square to Westminster. Hard by, in Victoria Street, a notable change is being wrought by the conversion into shops of the ground floors of the lofty buildings, almost all of which have until recently been let as residential flats; so that the long street, after the offices of the agents of the several colonial Governments which cluster near its Westminster end has been passed, is likely to become an important commercial thoroughfare. Steady progress is being made with the erection of the new Roman Catholic cathedral in the adjacent Ashley Gardens, and it is expected to be opened in September next, which is also the time chosen for the opening of the new Metropolitan Tabernacle. Another notable structure recently erected (at a cost of about £200,000) is the second block of the new Admiralty buildings, of which a good view may be obtained from the Horse Guards Parade. The erection of a third new block is contemplated, and the fourth side of the Admiralty quadrangle has been mentioned as its probable site. At South Kensington the erection of some important buildings is proceeding. It was a year last Thursday since the foundation-stone of the museum building that will replace the eyesore of the Brompton Boilers was laid by the Queen. Progress is being made with the groundwork preparatory to the erection of the handsome edifice designed by Mr. Aston Webb and another block of buildings planned by the same architect for the Royal College of Science, which will face the edifice that is now the headquarters jointly of the Imperial Institute and the University of London, has been commenced; while close at hand the builders are at work upon the new home of the Royal School of Art Needlework.

The Strand and the City. In the Strand the setting back of the shops that screen the Hotel Cecil from view affects a comparatively small length of one of London's busiest highways, of which the need for widening has become an urgent necessity. A more extensive improvement of this thoroughfare is being carried out by the removal of the block between the churches of St. Mary and St. Clement. No. 17, Fleet Street, the bogus palace, has been acquired by the London County Council, its purchase and contemplated restoration involving an expenditure of about £27,000. The sorely-needed widening of Fleet Street is being proceeded with at the end nearest to Ludgate Circus, the present instalment of the scheme extending as far as the "Punch" office, which is awaiting demolition. Along the Victoria

Embankment a number of handsome buildings are approaching completion, facing towards the river, and abutting upon the roadways that connect the Embankment and Fleet Street. The demolition of Newgate Gaol and the adjoining Old Bailey courts, rebuilt and enlarged in 1809, is an event of the near future; and upon the site which they occupy a new Sessions House will be erected at an estimated cost of £120,000. At the junction of St. Paul's Churchyard and Cheapside an improvement is being made by setting back a number of shops, with the result of widening an inconveniently narrow thoroughfare. In the neighbourhood of Finsbury Circus some extensive rebuilding schemes are in progress. The foundations of Mr. John Belcher's building for the Eastern Telegraph Company are being laid at the corner of South Place; a huge block of offices and other business premises, to be known as Salisbury House, is being built between the Circus and London Wall, replacing a multitude of meaner buildings; and the demolition of the old Ophthalmic Hospital and its neighbours, the Roman Catholic Church and schools of St. Mary, Moorfields, has been commenced. With all these improvements and new buildings London ought to look very different in the near future.

Rebuilding the Comédie Française.

It is not at all likely that the rebuilding of the Comédie Française will be finished in time for the National Fête of July 14th, as promised by M. Leygues. In the first place, the work to be accomplished is far more extensive than it was thought would be the case. The cursory examination of the ruins immediately after the fire conveyed the impression that the four principal walls of the theatre had suffered but little damage. The official architect, M. Guadet, has found, however, that one of the walls needs practically to be rebuilt, while much has to be done in the way of strengthening the remaining three. Another cause of delay is the fact that it has been considered advisable to make a number of changes in the plan of the old theatre. The corridors and staircases are to be widened, the arrangement of the dressing-rooms is to be modified considerably, and the building is to be lighted and heated on an entirely new system. The reconstructed theatre, too, will have lifts for the use both of the public and of the actors and actresses. In short, M. Guadet is bent on building a model theatre, an ambition most justifiable in itself, but quite irreconcilable with extreme despatch in raising the new building. To crown all, a characteristic official muddle has cropped up to interfere with the progress of the work of rebuilding. In order to carry out the proposed alterations and improvements additional space is necessary. It so happens that a ready means exists of obtaining it. A portion of the premises of the Comédie Française is let to two or three tenants, and the room they occupy would be at once available if they were to move out in return for an indemnity. Negotiations to this end have been begun, but none can say how long a time will elapse before they are brought to a satisfactory, or indeed to any, termination. The discovery has been made that much doubt exists as to which is the precise official department that ought to treat with the tenants, a piece of information which is quite sufficient to make it pretty certain that no undue haste will be exercised. Governments move slowly, and it may be fairly safely assumed that the Comédie Française will not be completed till the present year is nearing its close.

A Scotch Pile Structure.

At the last meeting for the present session of the Society of Antiquaries of Scotland, held last week, Sir Arthur Mitchell, K.C.B., M.D., LL.D., in the chair, Mr. John Bruce, F.S.A.Scot., gave some particulars of the excavation of a pile structure on the north bank of the Clyde at Dumbuck, about a mile to the east of Dumbarton Rock. When first discovered by Mr. Donnelly, a few of the tops of the piles were just visible above the mud. These piles were found to be of oak, twenty-seven in number, arranged in a circle

of 50ft. diameter, and spaced from 6ft. to 9ft. apart. Within the circle was a flooring of horizontal timbers of fir, alder, and birch, laid in three layers crossing each other at right angles. In the centre was a circular cavity, about 6ft. in diameter, filled with stones, and showing remains of walling round it. On the flooring round the central space were five circular paved spaces, the stones of which were packed with clay. About 20yds. to the north-west, a canoe hollowed out of an oak tree was found in a kind of dock, the walls of which were partly of stone supported by piling. A causeway of timber and stone led from the pile structure to the place where the canoe lay. To the west of the pile structure a pavement extends for 20yds., till it intersects a kind of breakwater which extended round the structure outside the piles. The worked objects found in the course of the excavation are chiefly of bone and stone. In the discussion that followed Dr. Joseph Anderson remarked that though this pile-structure presented some unusual features of construction and contents, both of these agreed so far with the generality of Scottish crannogs. But a considerable number of the objects in stone and shale, with incised carvings and pit marks, bore no resemblance to anything heretofore found in pile structures, or, indeed, anywhere else, except in the Fort of Dunbuie, not far distant. Mr. Andrew Lang, in a communication to the secretary, while offering no opinion on the stage of culture and relative antiquity to which the structure and remains at Dumbuck might be assigned, compared the markings on the portable stones found there with the cup and ring markings found on rock surfaces all over the world, and with the markings found on certain portable ritual objects in stone found among the tribes of Central Australia. He inferred that probably the same kind of marks had an analogous significance in this country at one time.

Mr. Rhodes' Architectural Project.

MR. HERBERT BAKER, F.R.I.B.A., of Capetown, has recently been at Athens examining, on the one hand, the quarries of Pentelicus, where colossal blocks of marble are now being excavated for the restoration of the Parthenon, and, on the other hand, studying Greek architecture in order to get ideas for an interesting commission he has on hand. He went, so it is stated, on behalf of Mr. Cecil Rhodes, who is desirous of erecting in Kimberley a marble monument to the memory of the British soldiers who fell while defending the town. This monument is to take the form of a bath with a colonnade round. Mr. Rhodes' architect has now left for Italy, where he will study Italian monuments and visit the quarries of Carrara.

Public and Private Architecture.

THE following remarkable outburst appears in this month's "Liberty Review":—"Architects! Good Heavens! the persons employed under this name by our lords and masters, 'the authorities,' so lack any real artistical sense that they could not design a cowshed whose form and appearance would pleasantly declare its purpose. Many of them would put cupolas on a dog kennel and broken pediments on a horse-trough." What, it will be asked, is all the bother about? Simply this: The "Liberty Review," whose mission it is to belittle all forms of public and municipal enterprise, has observed, like the rest of us, that official architecture is often neither beautiful nor inspiring. It has also been observing—from the outside, of course—two recently erected public-houses which it regards as "a rare combination of utility and art." From the beauty (real or supposed) of two public-houses, and the ugliness of certain government and municipal buildings, our contemporary seems to deduce that the architect who works for the noble and enlightened private patron is artistic and capable, while the architect who works for the wicked and debased public body (Government, Corporation, County Council, it matters not what) is—well, any bad name you can think of. Is the thing clear to you now, gentle reader?

Professional Practice.

Douglas, I.M.—The new municipal buildings were opened recently by the Mayor of Douglas, Alderman Webb, J.P. The site is at the top of Ridgway Street, adjacent to Victoria Street, and in close proximity to all important places and business parts of the town. The new building has been erected from the plans of Mr. Ardron, F.R.I.B.A., of the firm of Messrs. Ardron and Daws n, Westminster. The builders were Messrs. Gradwell and Co., of Barrow-in-Furness. The whole of the exterior has been built of dressed rubble stone from local quarries, with Bath stone facings. The principal entrance to the building is in John Street, and this leads to a spacious corridor with floors of marble mosaic containing the main staircase. On the left-hand side of the main corridor are the municipal offices, consisting of town clerk's office, enquiry office, public and rates office, and accountants' office. On the right are the water office and a well-appointed lavatory for the staff. In the John Street corridor, running to right of main corridor, are situated the borough surveyor's offices, consisting of his private office, enquiry office, drawing office, building inspector's office, and the car and sanitary inspectors' office. The new furniture in the office has been made by Messrs. Spence Brothers, of Douglas. Ascending the main staircase we reach the floor on which the Council Chamber and committee rooms are situated. The Council Chamber has a length of 47ft. and a breadth of 32ft., and the fittings are of oak. Accommodation for the public is provided in a gallery across the Church Street end. The whole of the furniture is upholstered in Morocco leather; it was designed by the architect, and made by Messrs. Goodall, Lamb and Heighway, of Manchester. The mayor's parlour adjoins the Council Chamber. Committee rooms, as well as the waiting rooms, are provided on the same floor, and also a cloakroom and lavatory. The second floor is devoted to the caretaker, the provision being of an ample character. The whole of the basement is excavated, and in front is a large room utilised as a book store in connection with the town clerk's department. Spacious cellars are used by the water department as stores, and provision is also made for the heating apparatus, the building being heated by low-pressure hot-water radiators supplied by Messrs. Spencer and Co., of Oldham. The free library joins the municipal buildings in Ridgway Street, and consists of large lending library, public reading room, and, on the upper floor, the reference room; also the librarian's private room and a lavatory. In the basement there is a book store. The furniture from the old library is to be adapted for the book store. The fire brigade is accommodated in a building adjoining the municipal buildings in John Street, and consists of a large room for the housing of the engine and appliances, tower for drying the hose, and a large assembly room for the use of the men. The whole cost of the buildings, including site, furniture and fittings, will be covered by the sum of £21,000.

Dundee.—Tenders are being invited for the new Dundee Sanatorium for consumptives to be erected near Auchterhouse from the designs of Mr. William Alexander. The buildings comprise a main block having a frontage of 200ft., and accommodating eighteen male and sixteen female patients. There will be four wards, each to accommodate four patients; and in addition to this eighteen single bedrooms will be provided. The doctor's quarters, which adjoin, are commodious. Each room for the patients faces south, with an oriel window giving access to the terrace and gardens. On the first floor will be provided sitting rooms for the doctor, the matron, and for the nurses. On the upper floor the accommodation, consisting chiefly of attics under a steep roof, will be devoted to bedrooms for the matron and staff. There will be ample lavatory and bathroom accommodation on each flat. The

corridors extend from end to end of the building, the interior of which will be fitted up with French windows coming close to the floor to admit as much free air as possible. All the rooms in the main block, with the exception of the sitting rooms used by the officials, will be heated by radiators. Another block adjoins that first mentioned to the north-west, and is connected to it by a covered corridor. Here provision is made for a dining hall capable of accommodating forty persons; and in connection with the large and lofty room are scullery, servants' rooms and other necessary adjuncts. In this block rooms will also be devoted for the nurses' and servants' dining. This part of the premises is kept entirely free from the main block, so as to prevent the odour of cookery permeating the sleeping and living quarters. The third block is for the most part devoted to laundry purposes. It is situated a little to the north-east of the main block. The laundry will be fitted with drying horses, steam mangles, &c., and there is also a boiler house, a kitchen, and a house for storage purposes, which, in the event of the electric light being installed, could be used for containing the secondary batteries. The building is to be of a plain character, but it will be fitted up in accordance with the most modern views of sanitary science. The total estimated cost is about £10,000.

London.—One of the most recent additions to the London restaurants is Messrs. Slater's new branch at 74 and 75, Cheapside. The approach is through a massive polished teak entrance, of a design characteristic of all Messrs. Slater's establishments. The walls of the ground floor restaurant, measuring 118ft. by 26ft., are artistically treated with light oak and blue mosaic, while above is a yellow silk flock decoration and an ornamental fibrous plaster frieze, the whole being shown off by a series of mirrors. Accommodation is provided for 260 diners. At the further end, where there is an extra entrance from Pancras Lane, is a staircase leading to a lavatory in the basement. At the Cheapside end access is gained to the smoking and luncheon restaurant downstairs, where 180 persons can be accommodated. This room is decorated on much the same scheme as the ground floor restaurant, is admirably lighted and ventilated, and is 120ft. in length. On the first floor a ladies' tea and coffee room is provided, with accommodation for forty ladies. The walls are tastefully decorated in white and gold, with Watteau hand-painted panels. Adjoining is a ladies' retiring and dressing room. The provision of this room is somewhat of an innovation in the City, but it is certainly a feature which will be appreciated. Throughout the whole of the restaurant electric light is fitted. The kitchens and larders, instead of being in the basement, as is usually the case, are situated at the top of the building, thus rendering it impossible for the objectionable fumes of cooking to escape into the restaurant. The contractors were Messrs. Spencer, Santo and Co., of Earl Street, Westminster; and the architect is Mr. Walter Graves, F.R.I.B.A., F.S.I., Winchester House, Old Broad Street.

Port Victoria.—The new headquarters of the Royal Corinthian Yacht Club, of which a perspective and plans are given on this page, was opened by the Commodore of the Club on Saturday, May 5th. The site faces the Melway, and the building has cost about £5,000. The architects were Messrs. Henry Ough and Son, of 64, Basinghall Street, E.C., and the contractors Messrs. West Brothers, of Strood, Kent. The foundations being on river mud were very difficult to deal with, and the building had to be floated on cement concrete. It is framed of baulk timber with steel stanchions and girders to carry the floors over the large spans, and filled in with steel lathing and cement plaster, faced with pebbles. There is a landing pier for boats opposite the principal entrance. On the ground floor is a large entrance hall and staircase, a club-room accommodating 200 persons, library, ladies' room, billiard room and lavatories; kitchen, bar, and serving rooms adjoin the club room. The basement is

fitted as a boat-house. On the first floor is sleeping accommodation for thirty members, with bath and lavatories; also steward's quarters, reached by a private staircase from the kitchen. On the second floor a smoking room and look-out is provided, commanding an extensive view of the Thames and Medway estuary. The premises are lighted by acetylene gas.

Surveying and Sanitary Notes.

The Estate of the late Mr. Rogers Field, M.I.C.E., shows a net personality of £65,369. There is a bequest of £5,000 to the Sanitary Institute.

Shipley Sewage Disposal.—An enquiry was held last week at Shipley (Yorks.) relative to an application by the Shipley District Council for powers to borrow £2,000 for the sewage disposal scheme.

The Red House, Stepney.—The Duke of Newcastle on Saturday laid the foundation-stone of the Red House, Commercial Road East, in connection with St. Augustine's Church, Stepney. The building is to cost £9,000.

Proposed new Recreation Ground for Chesterfield.—A Local Government Board enquiry was held last week into an application by the Chesterfield Town Council to borrow £4,000 for the purpose of acquiring a recreation ground for the North Ward.

Messrs. Kaye, Parry and Ross, civil engineers, of Dublin, have opened a London office at 53, Victoria-street, Westminster, and have entered into partnership with Mr. P. F. Mackenzie Richards, A.M.I.C.E., in connection with their English business. Mr. Richards is a well-known expert in sanitary engineering, as he has been for the last eighteen years one of the examining engineers of the London Sanitary Protection Association Ltd.

Institution of Civil Engineers of Ireland.—At a meeting of this Institution held at 35, Dawson Street, Dublin, on Wednesday last, Mr. Edward Glover, the president, announced that the Council had awarded the John Chaloner Smith premium to Mr. W. E. Adeney, D.Sc., for his paper on "The Bacterio-Chemical Study of Sewage and Polluted Waters: Part II. Sewer Sludges."

Sanitary Inspectors.—The result of the last examination for sanitary inspectors under the Public Health (London) Act, 1891, is that the following candidates have passed:—Mr. W. Brown, Miss E. S. Cann, Miss M. K. Ede, Miss E. G. Gamble, Mr. J. Johnson, Mr. John Jones, Miss M. K. Long, Mr. J. I. Lonnnon, Mr. A. W. Loughlin, Miss E. A. McCleverty, Miss B. T. Orme, and Miss M. O. Power.

Proposed Destructor for Dunfermline.—The proposal to erect a destructor for the disposal of refuse at Dunfermline is now under consideration. The engineer estimates that with 20 tons of refuse per day there should be a continual supply of steam at a pressure of 130lbs. per square inch from a boiler having 700 sq. ft. of heating surface. This would give an available supply of 116 horse-power. He thinks that the power might be used for lighting up the streets with the electric light. At present there are 436 lamps in the borough. The cost of a destructor such as is proposed would be £5,350.

The death is announced of Mr. Edward Pritchard, the well-known civil engineer of Birmingham. He was born at Wrexham in 1838, and was appointed borough surveyor of Clitheroe when thirty years of age. He afterwards became borough surveyor of Warwick, where he initiated several municipal schemes, but later he gave up the post and commenced an independent practice in Birmingham and London. His advice was sought by various Corporations, and among other works he devised the present waterworks scheme for Pretoria. He was also much appreciated as a tramway, sewage and mining consulting en-

gineer, and was a member of several learned societies.

Extension of Euston Station: Concessions.—The St. Pancras Vestry withdrew their opposition to the London and North Western Railway Bill now before Parliament, so far as it affects the extension of the Euston terminus, on the company agreeing: (1) To keep open the roadway north of Euston Gardens and to widen it to 60ft.; (2) to widen Melton Street to 50ft.; (3) to widen Seymour Street between Drummond Street and Euston Road to 60ft.; (4) to pay the Vestry £7,000 towards the opening-up of Churchway to Euston Road; and (5) to pay the cost of repairing with wood Barnby Street and Amptill Square from Seymour Street to Hampstead Road. Further, Euston Square Gardens are to remain intact, and the company undertake to erect dwellings to rehouse 1,020 persons of the labouring classes who may be disturbed, prior to their commencing works under the Bill. The Vestry consider these concessions to be very satisfactory.

Forthcoming Health Congress at Aberdeen.—The arrangements for the annual congress of the Royal Institute of Public Health which is to be held at Aberdeen from August 2nd to 7th are rapidly progressing. Acceptances of the invitation of Lord Provost Fleming have, it is understood, been received from a large number of local authorities, school boards, universities, and learned societies. The work is being arranged in five sections, and in three conferences. Mr. John Honeyman, R.S.A., Glasgow, one of the leading architects in Scotland, will preside over the section of architecture and engineering, and the conference of sanitary inspectors will be presided over by Mr. Peter Fyfe, chief sanitary inspector of Glasgow. All the meetings of the congress will take place in Marischal College Buildings, which have been placed at the disposal of the officials of the Congress by the University authorities.

Wood Paving for Brighton.—At last Thursday's meeting of the Brighton Town Council, the minutes of the Works Committee came up for approval. These stated that the surveyor had submitted plans and estimates of the cost of laying wood paving in the carriage-ways of the following streets:—St. James's Street and Upper St. James's Street, from German Place to Bedford Street; Bristol Road and part of St. George's Road, from Bedford Street to College Place; St. George's Road (the other part), from College Place to Eaton Place; Chesham Road and Rock Street, from Eaton Place to the Rock Inn. The Committee recommended that the roads mentioned should be paved with hard wood, with the exception of the portion of St. James's Street from German Place to High Street, for which they suggested soft wood on account of the comparative steepness of its gradient. The whole cost would be £12,058. After considerable discussion the recommendations of the Committee were adopted.

Sewage Purification in Bradford.—On Wednesday last the members of the Sewage Committee of the Bradford Corporation paid a visit to Field Head Mills, Preston Street, Bradford, to witness a demonstration of Smith-Leach's plant for dealing with the suds from the wool-washing machines. Mr. Leach showed the deputation round the new grease works. By the process which the committee saw the suds, after the wool has been washed, are passed into a cistern at the top of the building, and whilst warm suds are passed into a cylinder, which rotates rapidly, and the centrifugal action throws the grease to the outside of the cylinder, where it is separated by skimmers, and then passed off. The whole process is very effective, there being no effluent to pass into the drains. There is a great saving by using the distilled water after being through the cylinder. All the fats are recovered and made into articles of commodity. The plant is capable of dealing with 30,000 gallons per day. It is suggested that if woolcombers would put down one of these plants two more firms could join in the operation and relieve the Sewage Committee of their great difficulty.

New Patents.

These patents are open to opposition until June 25th.

1899.—Iron Roofs.—11,577. E. L. PEASE, Stockton-on-Tees. In a roof made according to this invention the headway or span is kept clear by arranging the ties and struts outside, the roofing itself being composed of panels with inset flanges interlocked in slotted tubular rafters. The invention is adapted to curved and pitched roofs.

Wood-working Machines.—12,919. S. BASTOW and H. McDONALD JESSOP; both of Leeds. This machine has special automatic feed and chain-driving gear, and several devices which cannot here be described, by which wood of any reasonable size can first be taken out of wind, and then planed, moulded, ploughed, and tongued.

Aventurine Tiles, Slabs, &c.—13,049. T. F. WALKER, Birmingham, and E. M. WALSH and S. B. WALSH, New Jersey, U.S.A. Small pieces of aventurine are placed in a mould of approximately the size of the article required, and the mould is then placed in a muffle or other furnace. Special care is needed to exclude all air or oxygen, otherwise the spangles which give the aventurine its beauty will oxidise and the material will be valueless.

Incandescent Gas Mantles.—21,200. J. JACKSON, Coventry. An inverted cone is fitted in the cap of the burner, and contains the crutch holder. By this formation the gas is forced out at the edge of the burner and so comes into better contact with the mantle, improving the light.

Gate Hinges.—25,083. T. H. BRAZELL, London, N.W. The object of this invention is to enable gates to be restored to their original position in the event of their becoming sagged. The hinge arm is extended so as to pass through the end rail, and is threaded to receive nuts, which work against a sleeve and a plate and pull up the gate to the desired extent. The invention is applicable to iron gates as well as to wooden ones.

1900.—Wrought Iron Window Sashes.—2,046. E. GLAUERT, Potsdam, Germany. The sash is built up of T-iron, but only one of the bars is bent and cut out, the other bar crossing it being simply pushed through slots in the former. The invention claims to do away with the mitering and slotting in the hitherto used moulded sash irons.

The following specifications were published on Saturday last, and are open to opposition until July 2nd. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—8,511, SIMPSON, ventilation of buildings. 8,561, WILLCOX (*Greaves*), gates. 8,731, HORNSNAILL, door check for preventing slamming. 9,380, FIRTH, BENTHAM and STOTT, incandescent gas burners. 10,514, JAMES, lock nut. 10,819, KITSON, vapour-burning apparatus. 10,917, FERGUSON, wood-working machine, combining circular saw, band saw, boring mill, and lathe. 11,016, EWING, pipe joints. 11,056, FALLOT and DELAUNAY, acetylene gas generators, and carbide cartridges for use with them. 11,091, EVERY, pulleys and wheels. 11,744, BOULT (*Gray and Wrazer*), moulds for making glass or similar ware. 11,994, PAKES, apparatus for bacteriological treatment of sewage. 12,000, MADDISON, method of fastening window blinds to rollers. 12,182, ADAMS, means for aerating and draining filter beds. 12,299, BREWER and STEVENS, fret sawing machines. 12,332, SPICHLI, blocks for floors and passages. 12,482, WINN, machines for the manufacture of roofing or flooring tiles. 12,640, MONCASTER, standards for wire fencing. 12,690, TAYLER and TAYLER, guards or fences for circular saws. 12,728, HAWGOOD, hinges. 13,042, HORSLEY, process for finishing the surface of aluminium sheets to render them suitable for artistic purposes. 13,066, ANSTRUTHER, drawing boards. 13,105, JANDUS ARC LAMP and ELECTRIC Co. LTD., and

JONES, electric arc lamps. 13,110, PRIEST, hinges. 13,141, OSBORN, MOREWOOD and MOREWOOD, stone drills. 13,184, LYONS, acetylene generators for portable lamps. 13,230, SÖDERLUND and EKVAL, apparatus for supporting pendant globes, applicable to the globes of inclosed arc lamps. 13,310, TALBOT, lanterns for incandescent gas lighting. 13,342, THOMPSON (*Lavaur*), guards or other protective arrangements for mechanical saws. 13,499, LEFRANC, process of grinding colours employed for ceramic purposes. 14,800, HADDAN (*Werkzeugmaschinen fabrik a Schärfl's Nachfolger*), vices. 15,814, MARCOTTE and LEGROS, lifting jacks. 17,583, HOLLIDAY, joints for drain pipes. 18,851, MAZEY, water-heating apparatus. 20,622, SCHRECK, acetylene gas generators. 23,398, SUGG, low-pressure gas-lighting apparatus.

1900.—316, VANDENHEUVEL, apparatus for making bricks. 1,223, PALMER and PALMER, travelling scaffold. 4,200, BERGDOLT, acetylene gas generators. 4,510, SCHULTZE and HARTMANN, flooring and similar surfaces. 4,553, BARNARD, wood-working machinery. 4,605, THOMPSON (*Tigerstedt*), manufacture of bricks and other refractory articles. 5,018, NEWTON (*New Jersey Wire Cloth Co.*), fireproof floors and ceilings. 5,019, NEWTON (*New Jersey Wire Cloth Co.*), fireproof ceilings, walls, &c. 5,446, ASSMANN, chain lifts or apparatus for lifting and lowering loads by means of flexible cords or bands. 5,617, NEWSUM and NEWSUM, construction of boilers applicable for hot-water heating apparatus. 5,704, SEABOURNE, means or apparatus for fastening scaffolding. 5,724, SHEPPARD, construction of metal fabric. 5,725, PARKER, devices for swinging window sashes. 5,732, HARKNESS, lifts or elevators.

Keystones.

A Memorial Brass to the late Archbishop Benson has been placed in Truro Cathedral. It was designed by Mr. F. L. Pearson.

A new Board School at Leytonstone is being built from the designs of Mr. W. Jacques to accommodate 1,500 children. The contractor is Mr. F. J. Coxhead, whose contract amounts to £25,698.

A new Methodist Church at Washwood Heath, Birmingham, has been erected at a cost of about £3,000. Messrs. Ingall and Son, of Birmingham, were the architects, and Mr. Thomas Johnson was the contractor.

New Church at Giffnock, Glasgow.—The new United Presbyterian Church at Giffnock has been opened. Mr. H. E. Clifford, I.A., of Glasgow, was the architect of the building, which has cost about £3,000.

Wolvey Church, Hinkley, has been reopened after restoration. The nave and north and south aisles have been re-roofed, the pews have been reconstructed, an oak pulpit has been provided, and a new parapet has been placed on the nave roof. The cost is about £1,800.

Woodhouse Grove School, Apperley Bridge.—The new wing which has been added to this building by public subscription comprises, on the ground floor, a gymnasium and art studio, on the first floor a reading room and two classrooms, and on the second floor a dormitory, with master's room.

Extension of Charing Cross Station.—On Friday last the Omnibus Bill of the South-Eastern and London, Chatham, and Dover Railway Companies came before a House of Lords committee. One of the principal objects of the measure is the widening and extension of the companies' terminus at Charing Cross at a cost of about £1,000,000.

The new Archway at Highgate will not be altogether finished till about August next. There has been some little difficulty and delay in acquiring land for widening the lower road, and the retaining walls at the foot of the slopes on each side are therefore only just commenced. But the new road above is now complete all but a little paving, and within about three weeks it will be ready for traffic.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDING—			
May 25	East Stonehouse, Devon—Additions to Board Schools	School Board	H. J. Snell, 11, The Crescent, Plymouth.
" 25	Salford—Retaining Wall	Improvement Committee	Borough Engineer, Town Hall, Salford.
" 25	Ton, Pentre, Wales—Storerooms, Stables, &c.	Industrial Co-op. Soc. Ltd.	Manager, 2, Church-road, Ton, Pentre.
" 26	Aberdeen—Offices, &c.		Cluny Estates Office, 16, Union-terrace, Aberdeen.
" 26	Carlisle—Farm Buildings	Colonel Aglionby	J. M. Richardson and Son, 5, Lonsdale-street, Carlisle.
" 26	Redruth—Reseating, &c., Church		H. W. Collins, Architect, Walreddon, Redruth.
" 26	Wisbech—Farm Residence, Stables, &c.	E. F. Newling	Kerridge and Sons, Architects, The Club-chambers, Wisbech.
" 26	Portslade, near Brighton—School	Portslade Industrial School Managers	T. Simpson and Sons, 17, Ship-street, Brighton.
" 27	Colne, Lancs.—Engine Shed	Lancs. and Yorks. Rly. Co.	Engineer, Hunt's Bank, Manchester.
" 28	Sheffield—Additions	Tramways Committee	C. F. Wike, Town Hall, Sheffield.
" 28	Glyn-Neath, Wales—Painting Church	Bethel Baptist Church Committee	J. S. Thomas, Hon. Sec., Glyn-Neath.
" 28	Thornley, near Tow Law, Durham—Classroom		Rev. E. Marsh, Old Vicarage, Tow Law.
" 28	Resolven, Wales—Fifty Houses	Cory Bros. and Co., Ltd.	J. L. Smith, Architect, Aberdare.
" 29	Bexley Heath, Kent—Hospital Buildings	Urban District Council	W. T. Howse, Surveyor, Public Offices, Bexley Heath.
" 29	Bridlington—Sunday Schools, Vestries, &c.	Quay Wesleyan Church Trustees	S. Dyer, Architect, Bridlington.
" 29	Radcliffe, Lancs.—Gasholder Tank	Gas Company	T. Newbigging and Son, 5, Norfolk-street, Manchester.
" 29	Stowmarket—Foundations	Rural District Council	Taylor, Sons, and Crimp, 27, Great George-street, S.W.
" 30	Winsford, Cheshire—Drill Hall		J. H. Cooke, Solicitor, Winsford.
" 31	Castle Hedingham, Essex—Alterations		Clerk, Parish Room, St. James's-street, Castle Hedingham.
" 31	London, N.W.—Boiler House	St. John, Hampstead, Vestry	Surveyor, Vestry Hall, Haverstock Hill, N.W.
" 31	Ovenden, Yorks.—Alterations, &c., to Cottage		M. Hall, 29, Northgate, Halifax.
June 1	London, E.—Repairs, &c., to Boys' School	Governors of Stepney and Bow Foundation	G. Elkington, 95, Cannon-street, E.C.
" 2	Cork—Gate Lodge		Rev. R. F. Clarke, Brinny Glebe, Upton, co. Cork.
" 4	East Ham—Municipal Buildings, Public Baths, Library, Technical Institute, Fire Station, &c.	Town Council	Surveyor, Public Offices, Wakefield-street, East Ham.
" 4	London, E.—Public Buildings	East Ham Urban District Council	Surveyor, Public Offices, East Ham, E.
" 4	Plumstead—Town Hall	Vestry	E. Hughes, Vestry Hall, Maxey-road, Plumstead.
" 6	Aylesbury—Arch Works	Bucks County Council	R. J. Thomas, County Surveyor, County Hall, Aylesbury.
" 7	Ealing, W.—Alterations, &c., to Fire Station	Urban District Council	C. Jones, Engineer, Public Buildings, Ealing, W.
" 8	Leeds Alterations and Additions to Inn	J. R. Heaton	F. Mitchell, 9, Upper Fountain-street, Leeds.
" 9	Markethill, Ireland—Renovating Church		J. Brown, 41, Kilmorey-street, Newry.
" 9	Weston-super-Mare—Pavilion	Urban District Council	Surveyor, Town Hall, Weston-super-Mare.
" 11	Castletownbere, co. Cork—Coastguard Station		H. Williams, Secretary, Office of Public Works, Dublin.
" 11	Wanstead, Essex—Painting and Repairs at Schools	School Board	J. T. Brassey, 70 and 71, Bishopsgate-street Within, E.C.
" 12	Londonderry—Belfry, &c.	Rev. J. K. O'Doherty	C. C. Ashlin and E. J. Toye, 7, Dawson-street, Dublin.
" 12	London, N.—Disinfecting Station, Shelters, &c.	Hackney Vestry	Gordon and Gunton, Architects, Finsbury House, E.C.
" 12	Brighton—Alterations	Town Council	F. J. C. May, Town Hall, Brighton.
" 12	London, N.E.—Buildings	Hackney Vestry	Gordon and Gunton, Finsbury House, E.C.
" 15	Cromer, Norfolk—Coastguard Buildings	Admiralty	Director of Works, Admiralty, Northumberland-av., E.C.
" 18	Luton—Engine-house, Boiler-house, &c.	Town Council	Borough Engineer, Town Hall, Luton.
ENGINEERING—			
May 25	Devonport—Electric Cables	Corporation	C. Furness, Electrical Engineer, Technical School, Devonport.
" 25	Pentre, Glamorgan—Gas Plant, &c.	Gas and Water Committee	O. Thomas, Engineer, Gas and Water Offices, Pentre, E.S.O., Glamorgan.
" 25	Walthamstow—Fire Alarms, &c.	Urban District Council	E. Morley, Surveyor, Town Hall, Walthamstow.
" 25	Salisbury—Cylinders	Urban Sanitary Authority	J. C. Bothams, City Surveyor, Salisbury.
" 26	Middlesbrough—Heating	Baths Committee	G. Bainbridge, Town Clerk, Middlesbrough.
" 26	Wemyss Bay, Scotland—Pier Extension	Caledonian Railway Co.	Engineer, Buchanan-street Station, Glasgow.
" 26	Padiham—Engine and Exhauster, &c.	Gas Committee	J. R. Smith, Clerk, Council Offices, Padiham.
" 26	Warrington—Boiler and Superheater	Corporation	J. Deas, Engineer, Bank House, Warrington.
" 26	Crewe—Electric Street-lighting Extensions	Town Council	Hopkinson and Talbot, 26, Victoria-street, S.W.
" 28	London—Steam Cooking Apparatus	Holborn Union Guardians	J. Buley, Suffolk House, Laurence Pountney-hill, E.C.
" 28	Southampton—Boiler, &c.	Corporation	R. R. Lathorne, Town Clerk, Municipal Offices, Southampton.
" 28	Portsmouth—Bridge		A. Hellard, Town Hall, Portsmouth.
" 28	Leeds—Electric Lighting Plant	Lighting Committee	H. Dickinson, 1, Whitehall-road, Leeds.
" 28	Belfast—Crane Repairs	Harbour Commissioners	G. F. L. Giles, Harbour Master, Belfast.
" 28	Ilford—Effluent Outfall	Urban District Council	Taylor, Sons, and Crimp, 27, Great George-st., Westminster.
" 29	Ewesley, Northumberland—Reservoir	Tynemouth Corporation	Borough Surveyor, Tynemouth.
" 29	Brighton—Winding Shaft at Pumping Station		F. J. Tillstone, Town Clerk, Town Hall, Brighton.
" 29	Dublin—Extension, &c., of Piers	Office of Public Works	H. Williams, Secretary, Dublin.
" 30	Grangemouth, Scotland—Water-pipes, Filter Tank, &c.	Police Commissioners	A. and W. Black, Engineers, Falkirk.

CONTRACTS OPEN.

VESTRY of ST. JOHN, HAMPSTEAD.
TO BUILDERS.

The Vestry invite TENDERS for the ERECTION of a BOILER-HOUSE, &c., at the Hampstead Public Baths, 175, Finchley-road, N.W.

Plan and specification can be inspected, and form of Tender obtained on application to C. H. LOWE, M.I.C.E., the Surveyor, at the Vestry Hall, Hampstead.

The person or firm whose Tender is accepted will be required to enter into a written contract, and to provide two sureties for the due performance of the same. The expenses of contract and bond to be paid by the contractor.

Sealed Tenders to be delivered at my Office by FOUR p.m. on THURSDAY, MAY 31st, 1900.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order,

ARTHUR P. JOHNSON,
Vestry Clerk.

Vestry Hall,
Haverstock Hill, N.W.,
May, 1900.

TO BUILDERS and CONTRACTORS.

TENDERS for the ERECTION of new COAST-GUARD BUILDINGS at Lannacombe, near Prawle (Kingsbridge), in the County of Devon, consisting of quarters for three men, Watchroom and Boathouse, will be received at this office before NOON on FRIDAY, JUNE 8th, 1900.

Copies of the drawings and specification will be supplied on application at this Office, or can be seen at the Coastguard Station at Prawle.

Director of Works Department,
Admiralty.

No. 21, Northumberland-avenue, London, W.C.,
May, 1900.

EALING URBAN DISTRICT COUNCIL.

The above Council is prepared to receive TENDERS for the ALTERATION to FIRE STATION and ADDITION of STABLING to same.

Full particulars and quantities may be obtained, and plans and specification may be seen at the office of Mr. C. JONES, M.Inst.C.E., the Engineer and Surveyor to the Council, Public Buildings, Ealing, W.

Tenders upon the printed forms, and indorsed in the envelopes supplied, to be delivered by NOON on JUNE 7th.

The Council do not bind itself to accept the lowest or any Tender.

By order,

W. RUSTON,
Clerk.

Public Buildings,
Ealing, W.

COUNTY BOROUGH of CROYDON.
TO SEWER CONTRACTORS.

Notice is hereby given that the Council are prepared to receive TENDERS for the CONSTRUCTION of about 850 yards of 27in. PIPE SEWER, and about TWO ACRES of BACTERIA BEDS for treating sewage upon the Beddington Irrigation Farm, near Croydon.

Full particulars may be obtained on application at the Borough Engineer's Office, Town Hall, Croydon.

Tenders to be sent to me by ELEVEN o'clock in the forenoon on MONDAY, JUNE 18th, 1900, endorsed "Bacteria Beds, Beddington Farm."

The Council will not be bound to accept the lowest or any Tender.

By order,

E. MAWDESLEY,

Town Hall, Croydon,
May, 1900.

Town Clerk.

COUNTY BOROUGH of CROYDON.
TO ENGINE and PUMP MAKERS.

Notice is hereby given that the Council are prepared to receive TENDERS for the SUPPLY of ENGINES and PUMPS in duplicate to lift 100,000 gallons per hour, to be erected upon the Beddington Irrigation Farm near Croydon.

Full particulars may be obtained on application at the Borough Engineer's Office, Town Hall, Croydon.

Tenders to be sent to me by ELEVEN o'clock in the forenoon on MONDAY, JUNE 18th, 1900, endorsed, "Bacteria Beds, &c., Beddington Farm."

The Council will not be bound to accept the lowest or any Tender.

By order,

E. MAWDESLEY,

Town Hall, Croydon,
May, 1900.

Town Clerk.

COMPETITION.

A PREMIUM of £20 is offered for the best and most economical PLANS for CHAPEL, &c., to be erected in Exeter. Drawings to be sent in not later than AUGUST 31st. For particulars, apply to REV. C. STEDEFORD, 27, Richmond-road, Exeter.

An Architectural Causerie.

Nature and Architecture.

ALTHOUGH at first sight there may appear to be but little connection between

natural history and architecture, yet the closer organic life is investigated the greater are found to be the treasures of art it reveals, it being impossible to follow carefully any branch of natural history without gaining inspirations of artistic and constructional value. Let the student take up the study of entomology and glance at the life history of the family of the Neuroptera, or "nerve-wings," so called from the beautiful framework upon which the wing-covering is spread, a framework which might well serve as a study for the filling-in of the windows of our noblest cathedrals. The earlier life of these insects (of which the gnat and stone-fly are familiar examples) is passed below the surface of ponds, where the soft and juicy body of the immature fly forms a most tempting morsel to the hungry trout or perch. It is therefore necessary that some protection should be provided, and in the construction of such protection the little architects give us some of the best examples of the adaptation of local materials to the work required with which the writer is acquainted; such materials appearing in many instances most unsuitable for the work sought to be accomplished. Thus, one little fellow, with sticks about one-eighth of an inch in length, artistically constructs a case which the backwoods settler might have taken as a model for his log hut, with its timbers crossed upon each other at its angles. Another gains his object by cementing grains of sand together into a concrete tube; or, should his material be too large for concrete he builds a rubble house, at the contemplation of which the builders of the Irish peels might well hide their diminished heads. A fifth, whose abode is in the warping drains of Thorne, where neither stick nor stone is to be found, presses a beautiful little spiral shell into his service, and, without consulting the unfortunate tenant in possession, builds his home of a material which man has used (after its petrification) in the construction of Peterborough Cathedral—a careful examination of whose stones will reveal that they are made up almost entirely of minute shells. The bee is an almost threadbare illustration, yet few are aware of the mathematical precision with which it constructs the cells of the honeycomb, in order to obtain the maximum of strength with the minimum of material, the primary aim of all good architectural construction. Réaumur having made careful measurements of the angles of these cells, found them to be $109^{\circ} 28'$, and $70^{\circ} 32'$. He then requested M. Koenig, a skillful mathematician (without informing him for what purpose he required the information), to determine by calculation what ought to be the angle of a six-sided cell, with a concave pyramidal base formed of three similar and equal rhomboidal plates, so that the least possible matter should enter into its construction. M. Koenig found, by the infinitesimal calculus, that they should be $109^{\circ} 26'$ and $70^{\circ} 34'$, or about one-sixth of a degree more or less than that employed

by the bees, and this difference in the measurements was afterwards found to be due to an error in the human calculation. No architect would deny the value of a knowledge of geology in determining the site for, or materials of, a building, yet how few of the actual workers in stone know anything of the life history of the rock upon which they are working—a knowledge, the joy of which is so delightfully told in Hugh Millar's autobiography, "My Schools and Schoolmasters." The microscope reveals an inexhaustible fund of designs for "all trades," designs undreamt of by those who have not studied them. It also reveals mechanical appliances, from which the greatest engineers could obtain, and in some instances have obtained, invaluable inspiration. Few of our boasted

thought of Tertullian is now better understood than when first uttered: "Man is made in the likeness of God; God, in forming the first man, took for pattern the future man, Christ." The human frame is, moreover, the highest embodiment of the architect and the engineer; its lightness, economy of material, and surpassing strength are unapproached by anything that man has put together." A careful examination of the section of a nautilus will enable the architectural student to appreciate the following extract from Mr. Arthur Stratton's thoughtful paper*: "Wren's staircases within the towers are very cleverly arranged, and almost seem to suggest a study of conchology. They never appear as external excrescences. The line of the front of

inventions but have been foreshadowed by Nature; yet most of us are like the conceited artist who would not admire a fine sunset, as "it had been copied from one of Turner's." With the aid of the spectroscope one may get studies of colour, and, without it, of forms which should be eagerly grasped, not only by the designer in textile fabrics, but by workers in wood, stone, or iron.

The study of human physiology has been well shown by Dr. Alfred J. H. Cristie to be one which might be well and profitably followed by the engineering and architectural student. He asks: "What of the lightness and strength of the human frame, of the protection which the bony framework affords to delicate structures, and of the capacity for repairing injury? 'Fearfully and wonderfully made' is inscribed on every part; and the beautiful

the steps always runs to the face of the newel and not to its centre, giving the best tread." No one has made greater use of the "Pook who runs may read" than John Ruskin, and perhaps no better words could be found in which to close this appeal to my fellow craftsmen to study the works of God within and around them, than his poetical description of a piece of the Master-Builder's Architecture:—"A fragment of building amongst the Alps simply illustrative of the chief features . . . necessary to the perfection of the wall veil . . . a wall truly of some majesty, at once the most precipitous and the strongest mass in the whole chain of the Alps, the Mount Cervin. . . . It is a vast ridged promontory . . . lifting itself like a rearing horse, with its face to the east.

* BUILDERS' JOURNAL, Nov. 25th, 1896, page 246.

All the way along the flank of it, for half a day's journey on the Zmutt Glacier, the grim black terraces of its foundations range almost without a break, and the clouds, when their day's work is done and they are weary, lay themselves down on those foundation steps and rest till dawn, each with his leagues of grey mantle stretched along the gristly ledge, and the cornice of the mighty wall gleaming in the moonlight, three thousand feet above."

T. W.

Is it Done Better in France?

SOME years ago the "Daily Telegraph" was continually holding up the example of Paris to us Londoners, with the object of proving that, among other things they manage better in France in general and Paris in particular; the streets and the architecture lining them were in every way superior to anything we could show. The young lions of the "D. T." roared bravely in those days, but now that their manes have grown grey they have garnered wisdom, and we hear in those columns little advocacy of things Parisian. Others are left to take up the tale, and they do it with a will. But is it, after all, convincing? To one who has never been in France before, the first glimpse of things French is startlingly novel, and to most people novelties are admirable. Change is essentially the spice of life, up to a certain time, after which it becomes gall and bitterness; hence, we may shrewdly suspect, the charm to Englishmen of things Continental; hence also, *per contra*, the picturesqueness which the foreigner not infrequently finds in our surroundings, so despised by some of ourselves. The "Telegraph" called for things characteristic of Paris, such as boulevards and kiosks, to be introduced here. We have not got those boulevards, but the kiosks (of the approved Lutetian pattern) have been for some time past with us, and they have not added to either the gaiety or the beauty of London, although they may have usurped (and do usurp) a goodly proportion of the pavements which were already too crowded. A kiosk as seen by newly-travelled Britishers in Paris was a novelty, and consequently interesting; as imported they are little less than sordid nuisances. Are these things really done better in France? As a matter of fact, they are not; nor is French street architecture really worthy to be copied here, for much of it is of a thin and academic Renaissance character, and without the individualism which, sometimes for good and occasionally for evil, marks our own efforts. In Paris, for instance, one finds streets upon streets of houses with good pretensions to architecture, but with as little life or character as the copy-book "copper-plate" handwriting examples of our school days. Between that street architecture and much of our own there is the difference, in fact, of those elegantly-written maxims of our youthful times and the virile signatures of our after years. This is no brief for Gower Street or Vauxhall Bridge Road, which we would gladly exchange for those Parisian streets of the most formal type that ever derived from an architectural primer. Bloomsbury Street and that weary road leading from Pimlico to South Lambeth have never pretended to architectural dignity, and arose in times when four walls, a roof, a door, and an adequate number of windows satisfied the most exacting taste. They would be impossible now, just as (let us sincerely hope) another Cromwell Road would be. It is rather to the newer parts of Kensington, and much of the rebuilt areas of Chelsea and of Mayfair, that we may point, and refuse to exchange for the creations in brick and stone so much admired by some sojourners across the silver streak.

C. G. H.

On Reflection.

The Wicked Engineer.

UNDER the auspices of a committee of influential architects in London and the Provinces, an architectural congress is to be held at the R.I.B.A. during the week commencing June 18th. Sundry visits are to be made, papers read, and resolutions moved, and such a congress might well become an annual fixture, for the cause of Architecture cannot be harmed, and may be benefitted by a little free discussion. Glancing down the provisional programme we find three resolutions set down for Friday, June 22nd. Why there should be three is not quite clear, for they are all to the same effect:—That the borough engineer and surveyor should not be permitted to design "buildings of a municipal character," and that his duties "should not include work of an architectural character." Now if the English language means anything, this indicates that the borough engineer should not be permitted to design a dog-kennel if the same was intended for his authority. We do not for a moment suggest that the borough surveyor should have a monopoly in the design of public buildings. Let an open competition under a competent assessor be held for the purpose of unearthing young and genuine talent, let the borough surveyor enter also if he chooses, and let the best man win. To say, however, that Corporations should not add an extra boiler-room on to their electric lighting works without calling in architects, who are notoriously ignorant in such matters, is a perfect absurdity. To hold, too, that because a man is an engineer, he is, therefore, utterly devoid of taste and fated to erect more horrible buildings than an architect is equally silly. No more deplorable municipal buildings have been erected in recent years than those designed by architects. One has only to recall the Plumstead Competition drawings or look round the Architectural Room at the R.A. to be assured of this. If some engineers who are also members of the R.I.B.A. will get up on Friday, June 22nd, there should be some plain speaking that would be salutary for those architects who desire protection for their bad work.

Restoration. WHEN a restoration scheme is mooted to repair one of our venerable buildings, architects of the "extreme" school are always quick to repudiate any connection with the movement, and when the work has been completed they are careful to say that the building has been entirely spoilt, its original designer grossly insulted, and that the architect and his employers are vandals of the grossest type. This kind of criticism appears with unflinching regularity after every restoration, and even where the work has been undertaken by one of their own number, the song of the "extreme" school changes not. Restoration is ever a thankless work. It is the hardest task in the world for the artist to accomplish, for he is ever dogged by the desire to put the stamp of his own individuality into the work, which would immediately destroy its character. Our interest in our old buildings is merely a life interest. We have neither the right to alter nor to dispose of them. They are the models from which we learnt our art, and our pleasure and duty is to preserve them for the study of our children and our children's children. But this is not the opinion of your extremist. He has seen the original stone, the original carvings; as long as they last his time what does it matter about future generations? Let time blur away the mouldings until they cannot be copied, let the statues crumble into shapeless

stones. Let the original architect's design, his beautiful tracery patterns, his exquisite mouldings disappear. What does it matter? The extremist has no love for the design; the stone—the base material, the vehicle of the artist's thoughts—is of more importance to him than the work of art itself. It is the worship of the pigments and the canvas, not the admiration of the brush work and the picture. He detests restoration, and consequently his restoration work is never good nor lasting, his workmanship never honest. Patching and puttying are his unsatisfactory methods of work. The old school "restored" every trace of the original design away; the new school would let Time destroy the entire fabric. Between these two extremes we want a new school who will have the wisdom to replace a beautiful carving before the pattern is lost, and who will keep our ancient buildings in a proper state of repair. Such a school will not putty, nor graft new stone, full of strong quarry-juice, on to the old, to the endamage of both, but their workmanship will be sound and honest. And while they are careful never to remove stone that may be left, they will remember that the preservation of the original design is of more importance than the preservation of the original material.

Will London Subside?

THE number of underground electric railroads in London, completed or about to be constructed, is causing "The Lancet" some alarm, and that estimable journal fears a general subsidence of the metropolis and the disappearance of London into its primeval swamps. It would be hard indeed if the proverbial New Zealander could gaze only upon the chimney-tops of our great city when he arrives, but we do not think such a sad catastrophe is likely to happen. Statistics all go to prove that London stands a great deal higher than it used, but whether this is due most to natural or artificial agencies we should not like to say. The reclamation of large areas of marsh land in the East End is praiseworthy, though the immediate letting of such ground for building purposes is most unwise. Probably most people know that the greater part of London is upheld by water, or, in other words, that the city rests on a bed of gravel percolated by water, and the divergence or withdrawal of that water means collapse. This is very well known to the underground railroad engineers, and their use of compressed air to keep such water out of the workings is evidence of the fact. So far the only subsidence that has occurred has been that of Mansion House Buildings during the construction of the Waterloo and City Railway, due, we believe, to pumping operations on the one side, and to lack of depth in the foundations on the other; but the element of danger was due to the dearth of news in the evening papers. If these railways were constructed on the lines of the Metropolitan and District Railway, we should be inclined to join our contemporary in pointing out future dangers. Under the circumstances we think danger, present or future, need not be apprehended, and while our contemporary enlarges on possible ill-health following subsidence, we would point out the advantages of journeying in breathable air and the lessening of the street traffic, beside the quickness of the passage to the healthier suburban or country atmosphere. If criticism can draw an official eye to the ways and routes of these railroads it will have effected some good, because they are being constructed without any system and in a somewhat haphazard manner. If the multiplication of these lines is lunacy, as "The Lancet" would appear to think, we may as well have some method in our madness.

ELIZABETHAN ARCHITECTURE.

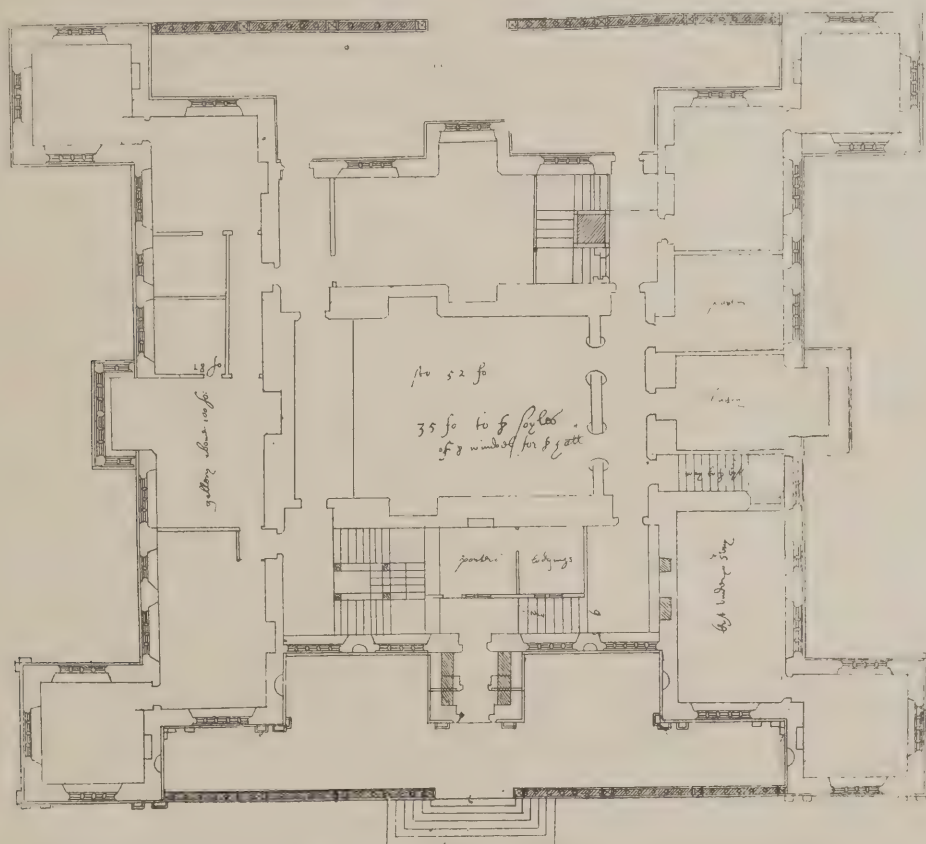

By PHILIP H. ELLIS.

"ELIZABETHAN" is the term applied to the earlier English version of the great Renaissance movement, originating in Italy in the fifteenth century through a multitude of causes, all of which may be summed up in the one supreme cause, "a remarkable stimulus of intellectual life." All the reform, genius and enterprise of this remarkable era follow as a natural result. The form this revival took in literary and popular estimation arose from the eulogistic admiration for the civilisation, literary and artistic, of classic times, expressed by such influential men and mighty geniuses as Dante, Petrarch and Cola-di-Rienzi, whose enthusiasm was constantly

countries lying nearer the source of the movement, and we may probably date its introduction here from the advent of Torregiano in 1512, who was sent for from Italy to design and prepare the monument of Henry the Seventh; and it is in such features as these, and the carving, mantelpieces, &c., that we first see Italian influence at work, there being several existing examples of structures in which the general design and workmanship are of pure Gothic character, whilst the carving of strings, bosses, finials, &c., show an entirely new treatment, indicating an ignorance of the old native traditions, and the handiwork of foreign craftsmen. Not until the days of Inigo Jones did English Renaissance architecture lose its peculiar "mixed" character, neither Gothic nor Classic, but partaking of the nature of both, full of picturesque charm and delightful inconsist-

manipulation, were constantly revealing to him new possibilities and yet wider scope for the play of a genius fancy free.

The craft guilds of mediæval days had fostered this spirit, and it was an evil day for the arts in general when the Renaissance in its topsy-turvydom diverted these great and potent centres of artistic life from their true and original purpose. They not only insisted upon a certain standard of excellence in their members, condemning all dishonest and slovenly work and urging the use of proper tools and good material, but they greatly promoted their social welfare also by encouraging a spirit of fraternity and healthy rivalry. So long as the guilds existed in their original state there was no necessity for "the architect" as we know him. The various groups of craftsmen had a continuous national tradition of their own, all were animated with

*Garden house**(Richard house)*

WOLLATON HALL, NOTTINGHAM: PLAN. FROM THE JOHN THORPE COLLECTION.

receiving fresh impetus from the almost daily discovery of ancient manuscripts, poetic and historic, of rare worth, profound treatises on arts and sciences lost for ages, and miracles of the sculptor's art, infusing into minds wearied of the then existent and unsettled state of society and eagerly searching for a solution of the problem of how to effect a satisfactory reformation, new motives, nobler ambitions, and inspirations boundless in their range.

In the noble remains of the great Art Epoch of Rome the architects found their inspiration ready to hand and evolved from it a type of design at once expressive of the ambition and power of a great people and suitable to the wants of a rapidly advancing state of civilisation. Of the wisdom of choice, and the soundness of judgment, of the early Revivalists in Italy, we have ample proof in the widespread popularity and great influence their work rapidly achieved over all the great nations of Europe.

The isolation of England and the infrequency of international communication in those days prevented the penetration of the new order of things into this country till rather later than was the case with those

encies. We constantly see in buildings of this type pointed doorways surrounded by a framework of Classic columns and entablature, and many-mullioned windows of mediæval days bordered with architraves of quite another character, giving evidence of a lingering affection for the old traditional types and a disinclination to adopt more of the new forms than it appeared to them might advantageously be grafted on to the old. This juxtaposition of the two opposite types of design produced compositions frequently crude in outline and clumsy in detail compared with the later phases of the Renaissance, from the hands of Inigo Jones and his followers, but what architecture gained by the scholarly treatment and pure Palladianism introduced by this master it lost in human interest. When the architects ceased to be craftsmen, and the craftsmen designers, the charm and poetry of our art vanished. Its place was taken by a correct but heartless formalism, and the joy of the worker was no more "hewn into the very walls themselves," nor the mingled emotions of his mind impressed by deft fingers with unconventional ease on materials which, as a natural result of the thought entailed in their

one motive, and one great spirit of "endeavour" pervaded them all. Thus, and under such conditions only, was rendered possible that individuality of parts with unity of mass and oneness of impulse which characterised the arts of Mediæval Europe, and without which no art worthy of the materials of its expression, and the labour involved therein, can ever hope to exist. The influence of the guilds with their traditional methods continued in gradually diminishing degree down even to Wren's day, as evidenced by the following passage from a letter written by him when forwarding plans and instructions for the library of Trinity College, Cambridge:—"I suppose you have good masons; however, I would willingly take a further pains to give all the mouldings in great," indicating that if the craftsmen were of "good" report they were still considered capable of preparing their own details without any fear of the painful discord which almost invariably results if we of the nineteenth century delegate to them even the smallest portion of a design. The fact is they have lost interest in their work, and who can wonder?

Returning to the advent of Torregiano,

immediately succeeding that event there was a very large influx of foreigners—Italian, French, German, and natives of the Low Countries—practising all manner of crafts, who came over partly to escape the religious persecutions and political strife with which the greater part of Europe was then infected, and partly because they saw in the increasing wealth and prosperity of our nation a means of advancing their own position in life.

In mediæval days the Church had been the great builder; now her lands and her coffers were in the hands of the laity, and the building of churches gave place to the building of palaces. The aisles and walls of the former were made receptacles for cumbrous monuments of vari-coloured marbles, frequently lavishly gilt, but, as a rule, in anything but the best of taste, though distinctly

both by land and sea, of which buffet and cabinet gave evidence in their proud display of treasure or relic gotten in hard sea-fight with some Spanish galleon, and objects of rare design and workmanship secured through the bargaining of merchant venturers to distant lands—pioneers of the great commercial and maritime power of our nation.

Wealthy patrons of the arts when not employing foreign craftsmen of repute, such as Haveus of Cleves, employed by Dr. Caius at Cambridge, or Henryck, at the Royal Exchange, were occasionally at the expense of sending their own English protégés to study abroad, as, for example, John Shute, who was sent to Italy in 1550 at the expense of the then Duke of Northumberland, "ther to cofer," as he tells us, "wt the doiges of ye skilful maisters in architectur, and also to view such

quoted as the designer; but there appears to be no documentary proof of his claim. In a grant from the king dated June 30th, 1544, this John is awarded the sum of 2s. per day for his services in architecture and music and is therein described as "devizor of his Majesty's buildings" (Hakewell). Perhaps the most popular of the architects of this era in England, judging by the number and importance of the buildings generally attributed to him, was "John Thorpe," an Englishman, though, owing to the non-occurrence of his name in the works of contemporary historians, or even, so far as has been ascertained, in the building accounts of the several works themselves, he is considered by many rather a mythological personage, the only evidence in support of his claim being the remarkable collection of apparently original studies

WOLLATON HALL: HALF ELEVATION. FROM THE JOHN THORPE COLLECTION.

characteristic of an age in which man, his wealth, position and achievements, were the chief consideration. A few features in the way of fittings were also added to the existing churches, but, generally speaking, they are of comparatively minor importance. The vast number of religious houses scattered throughout England, where not ruthlessly destroyed, or, after being denuded of the more valuable materials of construction, left to crumble into dust, were either adapted as residences by the less ambitious, or used as quarries for building in a more commanding situation the palatial dwellings of the more aspiring of the recipients of the king's favour in the distribution of monastic lands after the Reformation. It was an age of self-aggrandisement, a pompous, picturesque old time full of romance and daring exploit

añt monumentes hereof as are yet extant." (Gutch's Ren.) On his return Shute published a book on architecture, in which he styles himself "Paynter and Archytecte."

This work was too crude and insignificant to exert much influence, but the great and monumental work of Alberti, published in Italy in the previous century, and newly translated into English, was, in all probability, widely known and appreciated by the dilettanti of the day, and had a very considerable share in the formation of their architectural taste. In some cases models appear to have been prepared in Italy for large and important buildings, as in the case of Longleat, in Wiltshire, the model for which is stated to have cost the extravagant sum of £500, and may possibly have been brought over here by one "John of Padua," who is generally

designs, and surveys, numbering in all about 280 sheets, now preserved in the Soane Museum. These drawings of an Elizabethan architect form a most valuable and interesting record of contemporary methods of design and draughtsmanship.

Among the "studies" several sheets are devoted to the Five Orders, the employment of one or more of which in every conceivable position forms such a sure index to buildings of this date. A plan of Henry the Seventh's Chapel is included among the surveys of existing buildings, and it may be noted throughout that Thorpe's chief attention seems to have been given to the plans, they being, as a rule, carefully and fully drawn, whilst the external design is only indicated by half an elevation or perspective, the latter being drawn in an extremely quaint and

original way. Sections do not appear to have been thought necessary, and but few details occur.

Among the more important of the designs may be mentioned: — Buckhurst House, Sussex, 1565; Kirby, Northants (accompanied by the note "Whereof I layd ye first stone, A.D. 1570); Burghley, by Stamford, 1578; Burghley-on-the-Hill; Wollaton, near Nottingham, 1580-1588; Longford Castle, Wilts., 1591; Audley End, Essex; and a house with plan based on the initial letters of Thorpe's own name bearing the following inscription:—

Thes 2 letters, I and T,
B.ing joyned together, as you see,
Is ment for a dwelling howse for mee,
John Thorpe.

We have no record of Thorpe having visited Italy, but from some plans in the collection, namely, those for the "Queene Mother's Howse, fabor St. Jarmins, alla Paree, altered per Jo Thorpe," and "Monsier Jammet, his howse" (dated 1600) it seems probable that he visited France. In an article published in the "Building News" some years ago it is stated that in Wollaton Church there is a short inscription to Thorpe's memory in which he is recorded as "Surveyor and builder," but a diligent search and enquiry there fails to confirm this statement. There is, however, on the south wall of the south aisle of that building a handsome memorial tablet of considerable interest to our profession (see page 297) bearing the following inscription:—

"HERE LYETH YE BODY OF MR
ROBERT SMYTHSON GENT
ARCHITECTOR AND SURVAY
OR UNTO THE MOST WORTHY
HOUSE OF WOLLATON WITH
DIVERSE OTHERS OF GREAT
ACCOUNT HE LIVED IN YE FAYTH
OF CHRIST 79 YEARS AND THEN
DEPARTED THIS LIFE YE XV OF
OCTOBER ANO DMI 1614."

This inscription has afforded material for much controversy as to who was the actual designer of that grand building Wollaton, but, in the absence of documentary evidence, no definite conclusion has yet been arrived at. Smythson was evidently a member of the mason's company (note the arms, granted by Edward the Fourth in 1472, on the top of the

monument), and he appears to have been employed at Longleat in that capacity, from some papers in connection with which we learn that on or about the 11th of March, 1568, "Robert Smythson" succeeded John More as "head freemason." Knowing as we do that the master masons of his day not infrequently styled themselves "Architectur," "Archytecte," or "Architector," it does not follow that he was "architect" of Wollaton in the present-day acceptation of the term; indeed, it seems more probable that he occupied the position of "clerk overseer of the works," or "comptroller of the works," answering to the modern "clerk of the works," under John Thorpe, who prepared the general

small scale plans only. Thus, most of the design in the matter of detail and construction would fall to Smythson, so that, if this should be a correct view of the case, both are entitled to a fair measure of credit.

In conclusion, the buildings of the Elizabethan era offer to the architect of the present day a worthy and profitable subject for study and emulation. Not, perhaps, the more grandiose and stately of them, built more for external effect and to strike wonder into the beholder than for comfort and convenience, but the smaller edifices, the manor houses and homesteads scattered so plentifully throughout our land. Buildings marked by exteriors severe in their simplicity, relieved perhaps

PLAN OF A HALF-TIMBER HOUSE. FROM THE JOHN THORPE COLLECTION.

JOHN THORPE, HIS HOUSE

PLAN OF A HOUSE. BY JOHN THORPE.

only by a carved escutcheon over the porch, piquant and bold, but worth more in effect than dozens of yards of carved or moulded string and similar modes of "enriching" buildings. And the interiors of these simple, solid-looking houses how full of charm and how suggestive of homely comfort they are, with their low-panelled rooms and cosy ingles, their broad inviting window seats, and roomy bay windows, the wide and massively framed stair, the delicately modelled plasterwork on frieze and ceiling, and, as essential to the full and complete architectural effect of any building, the characteristic furniture. These, and a hundred other things, all unite in producing a whole, which, in appropriate suggestiveness for modern domestic design, has but few rivals.

SOCIETY OF ARCHITECTS.

ANNUAL DINNER.

THE annual dinner of the Society of Architects was held last Wednesday at the St. James's Restaurant. The chair was occupied by the President, Mr. T. W. L. Emden, L.C.C., and the company included Sir Wyke Bayliss, Prof. Silvanus Thompson, Mr. W. E. Riley (superintending architect to the L.C.C.), Mr. J. S. Fletcher (Deputy-chairman L.C.C.), Mr. C. Wall (President of the Master Builders' Association), and Mr. Goddard Clarke (chairman of the Building Act Committee L.C.C.), as well as a good number of members of the society.

After the toast of "The Queen" had been duly honoured, the President proposed "The Houses of Parliament," for which Mr. Atherley-Jones, Q.C., M.P., responded. Mr. Atherley-Jones expressed a very high regard for the House of Commons as the place where you have the most complete, courageous, and truthful expression of public opinion; but he did not think the Society of Architects had much reason to be grateful to that House. Owing to the accident of the ballot, and to the increasing demands made by Government upon the time of the House, the Society's Bill for the Registration of Architects had not yet been discussed. He knew the Bill was likely to meet with a very considerable amount of opposition. One member had that day expressed his determination to use all his influence to prevent the

passing of the measure. This gentleman's opposition was in the main founded upon the idea that it was not a reasonable thing to apply the rules of a profession to so great an art as architecture. He said: "Would you apply to a sculptor the rule that he must serve an apprenticeship before producing a piece of statuary?" In reply to this Mr. Atherley-Jones suggested that a statue had no internal sanitary arrangements, and pointed out that although it was perfectly true that architecture was a great and noble art, they saw nothing in the principle of this Bill or in its main provisions which would cause the smallest mischief to architecture as an art. As regards the best procedure to adopt, he thought that after the second reading had been secured, the Bill should be submitted to a select committee who should take the evidence of all persons interested in maintaining the dignity, prosperity, and efficiency of the profession; they would by this means be able to rub off any roughnesses or objectionable features that might exist in the Bill. He believed this Bill had a great and good object in view; to serve not the narrow and selfish interests

of the profession, but the interests of the public at large.

The toast of "The Clergy" was proposed by Mr. J. R. Manning, and responded to by the Rev. Dean L. G. Vere, who expressed a hope that the Society would do much to revive ecclesiastical architecture, and recommended the younger members to read Pugin's "Contrasts."

Mr. Silvanus Trevaill, F.R.I.B.A., in a racy speech, proposed "The London Authorities." After some appreciative remarks about the Corporation and the London County Council, he expressed the opinion that the latter body

had been unduly hampered by Government. He was a Britisher of the Britishers, but not a prejudiced one, and he could not help noticing that in other parts of the world there were better streets than in London. "We have not a decent street in London," he exclaimed, "as compared with the Ringstrasse, in Vienna, the Unter den Linden, in Berlin; or the Place Concorde, in Paris." Stimulated, apparently, by a few murmurs of dissent which this remark provoked, Mr. Trevaill went on to pour scorn upon the narrow streets and the squalid and rubbishy houses which we see everywhere in London. He attributed this state of affairs chiefly to our system of land tenure. In Austria, Germany, France and Switzerland builders got an absolute freehold; here they had to be content often with an eighty years lease. Architects should remedy this state of affairs. The average Member of Parliament, the gentleman who loafed about in the smoking room, did not understand these matters. Mr. Atherley Jones, who spoke like a brick—to use an architectural expression—was one of the most open and broad-minded of men, and he would have been struck with the contrast between the streets of London and those of foreign capitals. Notwithstanding its enormous area, London was a huge city of mediocrity as regards its architecture and streets; there was no general concentration of effort. With the broadening out of municipal institutions in London there ought to be greater possibilities for bringing this metropolis of the Anglo-Saxon race at least into line with the continental capitals.

Mr. J. S. Fletcher, Deputy-chairman of the L.C.C., in responding to this toast, spoke of the confusion created in the minds of foreigners by the various authorities existing and the new ones about to be created in London. He regretted that the corporation had not shown itself willing to be placed at the head of a united London. There was no more hard working body in the world than the London County Council, and, although it was not in favour with the Government of the day, this was only the normal condition of a progressive municipality. There was quite as much friction between the Government and the L.C.C. when Lord Rosebery was premier, and in Paris there was almost constant friction between the municipality and the Government; a great municipality was always in advance of

LONGFORD CASTLE. AS DESIGNED BY JOHN THORPE.

the Government. He trusted the L.C.C. would always be as hard working and as free from corruption as now. They were undertaking many great works at the present time. They would endeavour to make the new street between Holborn and the Strand equal to any street in any capital in the world, and they were shortly to put in hand the erection of a guildhall, which they were determined should be worthy in design and structure of the greatest municipality in the world.

The toast of the evening, "The Society of Architects and Architecture," was entrusted to Sir Wyke Bayliss and his address in submitting this may fairly be called the speech of the evening. If marred here and there by a touch of rhetorical exaggeration, the speech on the whole reached a very high level of thought and expression. It was in the spirit of a lover singing the praises of his mistress

northern reflections of them, Sir Wyke Bayliss went on to speak of London at the present day with its ugly streets and its possibilities for the future. Very effectively he told the story of Michael Angelo producing from a great shapeless block of marble, with which other sculptors could do nothing, his famous statue of David, now in the palace at Florence. Explaining the parable he said that London was that misshapen mass which no one had yet perfectly dealt with, but which it was for the architects of to-day to transform into something beautiful. The speaker also commended to the architects present Michael Angelo's treatment of his critics. When one who could never see any work without finding fault suggested that the nose of the statue was too large, Michael Angelo went up the scaffold carrying with him a handful of dust; he rubbed the nose of the figure, trickling down the

foreign cities the architect was practically a government servant. He was not only bound to pass an examination before he could practise, but he had to pass a more difficult examination than was even dreamt of in this country. They in the Society of Architects, who were in one sense the young men of the profession, believed that if the elder societies felt themselves too old or too wearied to enter into the strife and deal with this great question, they should themselves put their shoulders to the wheel and see if they could not bring about what others neglected to do. They would not take anything from the beauty of the building because they insisted that the architect who designed it should understand construction, know how to deal with it sanitarily, and how to secure proper ventilation. This was a homely question, but a very important one. No one could design satisfactorily

ELEVATION OF A HOUSE. BY JOHN THORPE.

that Sir Wyke addressed himself to the praise of Architecture, and he asked forgiveness if his address should sound a little like an epithalamium. There was scarcely a cathedral on the Continent that he had not so often drawn but that he could paint it from memory, and, if necessary, rebuild it if it were destroyed. "What shall I say of architecture?" he asked. "What is it that makes it worthy of our love and reverence?" Answering the question, Sir Wyke spoke of the close relation of architecture to our daily lives; for health in our homes and safety in our places of public assembly we were dependent on the architect. "Then all the loveliness of cathedral spire and church tower and broad facade, all these things come to us from the architect. You want things built strongly, make your pillars great, massive, that they shall bear weight, I drink then to the Doric. But you want more than strength, you want grace, you build your pillar with a scroll for its capital, I drink to the Ionic. But you want more even than that, you want the richness of carving and decoration, I drink then to the Corinthian." Leaving these styles and the

dust as if he had been lessening the size. Probably some of the dust went into the critic's eyes; he declared the figure was now perfectly satisfactory, though it had not been altered at all. "I say to the Society of Architects," concluded Sir Wyke, "that it is your business to deal with critics in that way. You are the judges of what is right in architecture, and the common people are not. The popular taste is always wrong in architecture, and the expert is always right. It is because I believe that that I am delighted to propose this toast and couple it with the name of your distinguished president."

The President, in his reply, touched as other speakers had done, on the question of London architecture, but expressed the opinion that bad as its architecture might be, London had a picturesqueness and beauty of its own which he trusted would never be wiped away by any new work. Unlike many foreign cities one could say of London that it was a "home" to its citizens, and the architect's business was first to build "homes," and afterwards to build houses. Passing to the question of Registration, Mr. Emden pointed out that in many

even a statue unless he understood anatomy, and what would it take from the sculptor's art if had to pass an examination? But they did not seek to limit the art of the man who designed statuary or painted pictures. But buildings had to be lived in, and it was necessary, therefore, that they should be designed with knowledge. A man might buy a bad picture or statue without doing anyone any harm. But if we had a city of houses which were insanitary or badly constructed, all who inhabited them would suffer. They would be pleased to work for this reform with any other body; they did not want to be exclusive. The matter was one which was for the benefit of the public as well as of the profession; the society had been working honestly and thoroughly, and he trusted that in the end they would be successful.

Lieut.-Colonel F. S. Leslie, R.E., in a humorous speech proposed the health of "The Visitors," to which Professor Silvanus Thompson responded, pointing out in the course of his speech that other bodies, such as the civil engineers, the chartered patent agents, and the plumbers, were moving in the

same direction in regard to the registration of their members.

The proceedings were enlivened with some capital music provided by Miss Esther Franklin and the Chandos Glee Singers.

GENERAL ARCHITECTURAL CONGRESS, 1900.

AN Architectural Congress will be held in London during the week beginning June 18th under the patronage and management of the undermentioned Committee. All architects and persons interested in architecture are cordially invited to attend the Congress and to take part in the discussions on the papers read. A card of admission to meetings will be sent to any non-member of the Royal Institute on application to the Secretary, R.I.B.A. A provisional programme of the proceedings of the Congress is given below. The meetings will be held in the meeting room of the Institute. Admission to each visit will be by separate ticket and all visiting tickets must be specially applied for. All communications should be addressed to the Secretary, R.I.B.A., 9, Conduit Street, W.

General Committee.

The following gentlemen will constitute the General Committee, of which the president will be Mr. William Emerson, President R.I.B.A.:—Rt. Hon. the Earl of Meath; Rt. Hon. Lord Windsor; Rt. Hon. Lord Stratheona and Mount Royal, G.C.M.G.; Rt. Hon. A. Akers-Douglas, M.P.; Sir William B. Richmond, K.C.B., R.A.; Sir John Taylor, K.C.B.; Sir Laurence Alma-Tadema, R.A.; Mr. C. Purdon Clarke, C.I.E.; Mr. Alfred Waterhouse, R.A.; Professor Aitchison, R.A.; Mr. G. F. Bodley, A.R.A.; Mr. G. J. Frampton, A.R.A.; Mr. Aston Webb, A.R.A.; Mr. John Belcher, A.R.A.; Mr. Walter Crane; Mr. Selwyn Image, Master of the Art Workers' Guild; Mr. Rowand Anderson, Edinburgh; Mr. H. J. Austin, Lancaster; Mr. Reginald Blomfield; Mr. Basil Champneys; Mr. John Douglas, Chester; Mr. W. H. Lynn, R.H.A., Belfast; Mr. Mervyn Macartney; Mr. Ernest Newton; Mr. E. S. Prior; Mr. Halsey Ricardo; Professor F. M. Simpson, Liverpool; Mr. W. M. Fawcett, Vice-President R.I.B.A.; Mr. E. A. Gruning, Vice-President R.I.B.A.; Mr. J. M. Brydson, Vice-President R.I.B.A.; Mr. Alex. Graham, Hon. Sec. R.I.B.A.; Mr. John Slater, Member of Council R.I.B.A.; Mr. H. H. Statham, Member of Council R.I.B.A.; Mr. Paul Waterhouse, Member of Council R.I.B.A.; Mr. J. J. Burnet, A.R.S.A., Member of Council R.I.B.A.; Mr. Leonard Stokes, Member of Council R.I.B.A.; Mr. J. S. Gibson, Member of Council R.I.B.A.; Mr. H. V. Lanchester, Member of Council R.I.B.A.; Mr. Thomas Drew, R.H.A., President Royal Institute of Architects of Ireland; Mr. J. Smith, President of Sheffield Society of Architects and Surveyors; Mr. A. E. Sawday, President Leicester and Leicestershire Society of Architects; Mr. E. I. Bennett, President Manchester Society of Architects; Mr. David Barclay, President Glasgow Institute of Architects; Mr. William Glover, President Northern Architectural Association; Mr. W. L. Bernard, President Bristol Society of Architects; Mr. Robert Evans, President Nottingham Architectural Society; Mr. E. A. Ould, President Liverpool Architectural Society; Mr. W. H. Bidlake, President Birmingham Architectural Association; Mr. W. Carby Hall, President Leeds and Yorkshire Architectural Society; Mr. Charles King, President Devon and Exeter Architectural Society; Mr. T. M. Cappon, President Dundee Institute of Architecture; Mr. W. Bell, President York Architectural Society; Mr. J. Coates Carter, President Cardiff, S. Wales and Monmouthshire Architects' Society; Mr. J. Souttar, President Aberdeen Society of Architects; Mr. Henry F. Kerr, President Edinburgh Architectural Association; Mr. J. Douglass Mathews, F.R.I.B.A.; Mr. Thomas W. Cutler, F.R.I.B.A.

Provisional Programme.

Monday, June 18th.—8 p.m. Reception by the President R.I.B.A. in the meeting room of the Institute, 9, Conduit Street, W. 8.30 p.m.

(first meeting). Presentation of the Royal Gold Medal. Owing to the unavoidable absence of the recipient, the Commendatore Rodolfo Lanciani, Professor of Roman Topography in the University of Rome, the medal will be received on his behalf by one of the secretaries of the Italian Embassy.

Tuesday, June 19th.—3 p.m. (second meeting). Paper: "The Official Control of Public Buildings," by the President R.I.B.A. 8.30 p.m. *Conversazione* at the Guildhall.

Wednesday, June 20th.—11 a.m. (third meeting). Papers: "The Collaboration of the Architect, the Painter and the Sculptor," by Mr. E. W. Mountford, Sir William Richmond, K.C.B., R.A., and Mr. Roscoe Mullins. 3 p.m. Visit to the new Westminster Cathedral. 8 p.m. (fourth meeting). Papers: "The Ideal City: Streets and Bridges: Public Monuments: Public Gardens and Open Spaces," by Mr. Halsey Ricardo, the Right Hon. the Earl of Meath, and others.

Thursday, June 21st.—12.30 p.m. Visit to be arranged. 3 p.m. Visits to Stafford House and other large houses. 8 p.m. (fifth meeting). Paper: "The Education of the Public in Architecture," by Mr. Reginald Blomfield.

Friday, June 22nd.—11 a.m. (sixth meeting). Business meeting—paper: "Uniform By-laws," by Mr. Lacy W. Ridge. Mr. Charles Hadfield (Sheffield) and Mr. A. E. Sawday (Leicester) will move the following resolutions:—

- (1) *That in the interest's of architecture it is inexpedient that buildings of a municipal character be designed and erected by engineers or surveyors having no architectural training.*
- (2) *That as a matter of sound finance and in the interests of ratepayers it is desirable that the duties of the borough engineer and surveyor should not include work of an architectural character.*
- (3) *That it is detrimental to the interests of the architectural profession that buildings of a municipal character should be designed and erected by the borough engineer and surveyor.*

3 p.m. Visits to Messrs. James Powell and Sons' glass works at Whitefriars, E.C., and Messrs. Holloway Brothers' works at Westminster. 7.30 p.m. R.I.B.A. annual dinner, Whitehall Rooms, Hôtel Métropole.

Saturday, June 23rd.—Visit to Greenwich.

NEW STATION AT NOTTINGHAM.

A WORK THAT HAS COST £1,000,000.

THE new station at Nottingham, the joint property of the Great Central and Great Northern Railway Companies, which was opened on Thursday last, was dealt with in a general way on page 278 of last week's issue. We now give some details of the great structure fronting Melbourne Street. The undertaking entailed the acquisition of an immense amount of property (luckily for the most part of a character which could well be spared), and has led to a complete transformation in the means of access to the eastern portion of the city, whilst it inevitably brought in its train the removal of many ancient landmarks. Briefly, all the buildings from a point at the west end of Woodborough Road as far as Lower Parliament Street have been cleared away. From Woodborough Road to Thurland Street, which may be roughly taken as the northern and southern limits of the alterations, the distance is 700 yds., and the average width is 83 yds.; and when it is remembered that the whole of this space has had to be excavated to a depth of 58 ft. at the Woodborough Road end and 27 ft. at the Parliament Street end, some idea may be gathered of the engineering difficulties that had to be surmounted. From this site 580,000 cub. yds. of material have been removed. The actual extent of the building frontage to Melbourne Street is 250 ft., and it rises to a considerable height. The tower, which is still incomplete, will be carried up to more than 100 ft. Designed in the Renaissance style, the buildings are constructed partly of Darley Dale

stone and partly of Nottingham pressed bricks. The lower portion, to a height of 23 ft., is faced with stone, and the first floor, to the under side of the main frieze, with pressed bricks and stone dressings, whilst the frieze itself and the dormers and gables are of stone.

At each end of the elevation are two massive wings, with pilasters on the ground floor and triple cylindrical columns on the first floor, whilst the booking hall is lighted by four large semicircular-headed windows, with stone mullions and jambs. The scheme is completed by rusticated columns running up to and breaking round the main cornice, and terminating with an ornamental pinnacle. The public footbridge from Melbourne Street to Glasshouse Street runs over the station at the north end of the station yard. The other public bridge, now known as Central Road, which has been open for a long time, is a massive structure, 279 ft. long and 40 ft. wide. It crosses the complete set of lines, its height above which is about 30 ft. Between the site of Cairns Street and Parliament Street, and from Bywell Street to Parliament Street, there are lofty retaining walls of blue brick, the first being 53 ft. high. The booking hall, which is entered from Melbourne Street, is 104 ft. in length and 66 ft. in breadth, with a height of 35 ft. Running round it, at a height of nearly 20 ft., is a handsome balcony giving access to a number of administrative offices on the first floor. It is panelled with pitch pine to a height of 11 ft., with plasterwork above. A cloakroom 50 ft. by 40 ft. adjoins the booking hall, with a basement of the same size, and this is connected with the luggage subway by an hydraulic hoist. When the spacious hotel which is to adjoin the subway has been erected, it will be connected with the booking hall by a covered way. At the north end of the main block provision has been made for dealing with the parcels traffic of both companies. Here are situated two offices 38 ft. square, with basements of similar dimensions, and a covered van-yard 75 ft. by 28 ft. Over the parcels office other rooms for the Companies' staffs are being fitted up. The largest basement is that under the booking hall, measuring 125 ft. by 66 ft. The main luggage subway is 14 ft. wide and 13 ft. 6 in. high, the walls being of glazed brick. Arrangements have been made for the drainage and roof water from the station to be dealt with in underground passages connected with the main subway by means of circular culverts 3 ft. in diameter, and through these also will be conveyed the gas and water pipes and electric cables. The roof of the station, which is entirely of glass, supported on steel principals, is divided into three spans, rising to a height of 42 ft. 6 in. above the level of the platforms. With a length of 420 ft., the central span has a width of 84 ft. 3 in., and each of the side spans 63 ft. 4 in. In addition to this, however, awnings extend for a further distance of 224 ft. north and south, over the bay platforms. All the walls in the station itself are faced with glazed bricks, with dressings of glazed vitrified terra-cotta, and the buildings upon the platforms are 40 ft. in height. In the dining and refreshment rooms the walls are lined with faience tiles, the floors are of ceramic mosaic, and the fittings of walnut. Granolithic flags are used in the paving of the platforms, and the whole of the station roof is accessible by means of ladders and gangways to facilitate cleansing operations.

Roughly speaking, the total cost has been a little over a million of money, but of this enormous sum the amount paid in compensation to the various owners whose property was affected came to more than one-half.

The whole of the works of the station buildings have been carried out by Mr. Henry Lovatt, of Wolverhampton, under the sole direction of Mr. Edward Parry, M.Inst.C.E., whose able assistants have been Mr. F. W. Bidder, Mr. A. E. Lambert and Mr. A. A. Barker, these gentlemen having been largely responsible for the engineering and architectural arrangements. The excavations for the site, the large bridges over Parliament Street and York Street, with the retaining wall, permanent way, &c., have been made by Messrs. Logan and Hemingway.

APHORISM FOR THE WEEK.

"If you get simple beauty and nought else,
You get about the best thing God invents."

—BROWNING.

Our Inset Sheets. The elevations of houses by John Thorpe are dealt with in the article on "Elizabethan Architecture," which commences on page 299. The design for a library at Port Elizabeth, South Africa, is by Mr. Frank Selby. This design was a competitive one, and the building was to cost £40,000. The materials proposed to be used for the elevations were cut granite for the ground floor, with red and buff terra-cotta above, and green slates on the roof. The house at Lenton Park, Nottingham, was completed towards the end of last year for Mr. W. G. Player. It is built of Ruabon bricks and Corse Hill stone. The interior has much elaborate woodwork. The work has been well carried out by Messrs. T. Fish and Son, of Nottingham, from plans and under the supervision of Mr. Arthur Marshall, A.R.I.B.A., of Nottingham.

A Worthy Petition. THE Society for the Protection of Ancient Buildings has presented the following memorial to the London County Council:—"We, the undersigned, desire to express our hope that the London County Council will use its influence for the preservation of the ancient houses on the west side of Lincoln's Inn Fields, some of which are reputed to be the work of Inigo Jones.—(Signed) G. Aitchison, R.A., L. Alma-Tadema, R.A., Balcarras, John Belcher, A.R.A., Walter Besant, G. F. Bodley, A.R.A., John T. Brunner, James Bryce, Carlisle, Martin Conway, Walter Crane, Frederick Duleep-Singh, Ernest Flower, E. Onslow Ford, R.A., W. Holman Hunt, T. G. Jackson, R.A., Godfrey Lushington, A. Benjamin Stone, A. Waterhouse, R.A., Aston Webb, A.R.A."

Home Arts and Industries. THE sixteenth annual exhibition of the Home Arts and Industries Association was held last Thursday, Friday, Saturday and Monday at the Royal Albert Hall, the stalls extending right round the gallery. On Thursday Princess Christian, accompanied by Earl Brownlow, the president of the Association, visited the exhibition. The constant and direct interest and aid given by Royalty to the Association has been of great service in the extension of its field of operations. The Association has now nearly 500 classes in various towns and villages throughout England, Scotland, Wales and Ireland, as against the forty begun with. The principles worked on are, in great part, Ruskin's, who gave his help and sympathy to the Association from the outset, and show by their success that they are right ones. The methods employed are to organise classes in which attendance is entirely—voluntary—and teaching almost entirely—voluntary, and to distribute to these classes selected designs and models and leaflets of information. To further the work of these classes a central office and studios are maintained in London, a yearly report published describing experiments in class-holding, and a yearly exhibition and sale held, where the work done in the various classes may be compared and criticised and where certificates of merit are awarded. The object of the association is educational and not commercial.

This Year's Exhibition. THE stalls at this year's exhibition represented over 100 classes and comprised specimens of wood-carving, inlaying, repoussé metal work, hammered iron, embossed and cut leather work, book-binding, pottery, baskets, handspun linen and woollen fabrics, lace, embroidery, smocking, plain needlework, knitting, rugs,

toys, &c. Space does not allow us to deal with the exhibits in much detail. The exhibits were, on the whole, of high merit with regard to the designs and of good craftsmanship. There was a large number of wood-carvings, chiefly notable being some from pleasing designs by Mr. Joseph Phillips. The repoussé copper work showed how effectively this work can be applied to decorative and domestic uses; Mr. Harold Stabler showed some repoussé screens, Mr. Walter Witter a neat fire screen, and Mr. J. Williams sent an excellent repoussé mantelpiece, for which a silver cross was awarded. Mr. Harold Rathbone's class, Birkenhead, exhibited examples in Della Robbia ware, two very pleasing panels being exhibited by Miss E. M. Rope. This ware is coming into great use on account of its great suitability for outside use by reason of its freedom from dirt and smoke colouring, but still its highly glazed surface is very objectionable, and if at all brilliantly coloured looks tawdry for decoration. Mrs. G. F. Watts' Celtic decorations carried out in terra-cotta were remarkably good and suitable to the material. Mrs. Watts' terra-cotta and the leatherwork designed by Miss Baker were, perhaps, the best things at the exhibition, the coloured leather work being most admirable. One of the gold crosses, which are the highest distinction at the disposal of the judges, was won by an exhibit of drawn thread and cut work by Annie Christie of the Langdale class. A curtain, woven and dyed by Charles Hugh, of the Llandaff class, after a design by Miss Mabel Hill, secured another of the gold crosses; and a third was given to Mrs. Waterhouse for the copper and brass repoussé work made by her class at Yattendon.

Dundee's Baths. IT is expected that the new baths and wash-houses to be erected in Constable Street and Caldrum Street, Dundee, will be ready by next spring. The Constable Street block is to be built of freestone with red brick facings. It will be two storeys in height, and the first floor will be laid out in washing stalls, of which there are to be forty-five. The experience gained in the Guthrie Street Baths—from the first an unqualified success—will be used to good advantage in Constable Street and at the other establishment in the north of the city, for everything conducive to comfort and the quick and convenient despatch of work will be introduced. The stalls will be large and well lighted, and, of course, supplied with a plenitude of tubs, wringers, &c. Offices, stores, stove-rooms, and entrance vestibule complete the accommodation on the ground floor, although a large boiler house is also provided for. On the second floor will be placed a waiting-room of extensive size and neat design. This apartment may be utilised as a reading or recreation room, although nothing definite in this direction has been decided upon. Such an innovation, however, would undoubtedly prove popular. The entrance to the baths (eighteen for men and twelve for women) is to be had from this floor. A new feature will be spray baths at a cheap rate, together with a suite of Turkish baths. The Caldrum Street building will resemble the other in many details, both outwardly and inwardly. In frontage it will be narrower, and it is proposed to put down only thirty-three stalls to begin with. Should occasion demand it, however, a policy of enlargement will not be impossible. There will be fifteen baths for males and twelve for females, with sufficient spray baths and Turkish rooms. At both new centres Turkish baths will be made a feature, as it is felt by members of the Town Council and others that this is a form of curative luxury which is not so thoroughly appreciated by the masses as it might and ought to be.

St. Saviour's, Southwark. A BEAUTIFUL drawing of the interior of this church by Mr. Hedley Fitton was published in the "Daily Chronicle" for May 23rd last, and the following extracts are taken from the accompanying letterpress:—"Beautiful as it is externally, the Church of St. Saviour, Southwark, the cathedral church of the new diocese

over the river, is internally one of the noblest ecclesiastical buildings in London. Probably its most distinguishing feature is the Lady Chapel at the east end, a fortunate survival of the numerous alterations made in the church early in the seventeenth century. Nine groined arches, dividing the roof of the chapel, are supported by two rows of six octangular pillars, with small circular columns at the four points; and the large window at the east end is divided by slender pillars into three lancet-shaped windows. Architecturally, also, the Lady Chapel is interesting as an illustration of the development of the pointed style. First there is the lancet-shaped window with the tooth ornament—called by French antiquaries "Violette," because of its likeness to that flower when half expanded—then the triple lancet, held together by an enclosing arch, next two three-light mullioned windows, and lastly, the blank flamboyant windows behind the screen, belonging to the decorated period of Edward III. At the north-east corner of the chapel is a wooden enclosure, containing a table, desk, and high seat. Here the Bishop of Winchester transacted business until the beginning of the present century, and the chapel itself was the scene of the trial and condemnation of many of the martyrs of Mary's reign, seven of whom are commemorated by lancet windows in the north-east and south-east. Dividing the Lady Chapel from the choir is a richly-decorated screen, which was restored by public subscription in 1832. The choir is a perfect example of Early English work, and the screen is magnificent, not only in its arrangement, but in its general design." In our issue for November 8th last we published an article dealing with the work of the late Sir Arthur Blomfield at St. Saviour's, which should be of interest at this time.

Melbourne to Blame. WE are now becoming accustomed to the periodical outbursts against the system which allows the veterans who have fought the nation's battles to exist on a miserable pittance, and finally die amidst poverty. A similar complaint could be made against Melbourne for having allowed the man who made the first survey of its site to close a long life in poverty and privation. It was only a few weeks before his death that the meagre pension of 30s. a week was granted, but, as usual, neglect in life has been followed by posthumous praise. Born in London in 1808, Mr. Robert Russel was articled to a firm of architects and surveyors, and was employed upon the repairing of Buckingham Palace years before the Queen ascended the throne. In 1832 he emigrated to Sydney, and three years later was despatched by the Government to report upon the little settlement which had been formed at the head of Port Phillip Bay, the germ of the Melbourne of to-day.

Strand-on-the-Green. TO those who knew the old Kew Bridge, the present spectacle at that part of the river will be a little surprising, for only the piers and the lower portion of the arches now remain. The stones are being collected on the Surrey shore, and fears are being entertained by those who love the picturesque for that quaintest of riverside villages, Strand-on-the-Green, almost the last survival near London of the curious old waterside settlements of which Wandsworth, before it was so largely rebuilt, was one of the best examples. To those who saw how soon the rebuilding of Putney Bridge some years ago caused the almost entire reconstruction and modernising of historic Putney, it seems that the red-tiled roofs and curiously-peaked maltings of Strand-on-the-Green have little chance of surviving, for already the ominous black boards of the auctioneers and the land agent are appearing along the river frontage, while several gaps in the rows of miniature old-world cottages, so characteristic of the place, have already been made. The place was a favourite haunt of Zoffany, the portrait painter, in the last century, and until recent years harboured a Bohemian artistic colony, whose members were wont to declare that the "atmosphere" of it surpassed Venice!

PROPOSED NEW NATIONAL MUSEUM.

A LECTURE was recently delivered at the Society of Arts by Professor Flinders Petrie on "A National Repository for Science and Art." The preservation of material for study, he said, had become an urgent question. Many of the sciences rested on proofs and bases which were partly or entirely vanishing. We had nothing yet but stray examples of the prehistoric ages of other countries. In Egypt alone the prehistoric pottery extended to 900 varieties; and when he made an offer to the British Museum he was asked to send as few as possible. To get ten square yards more in English museums was a problem. The bulk of the Greek and Latin inscriptions that we possessed was stored in cellars of the British Museum in the worst of lights. When the earliest Greek tools were offered to the British Museum they were declined as being too ugly, and they were lost beyond recall. The subject of casts was a national scandal. As to the last 1,500 years, the prospect was far worse. Of our own architecture there was no collection, except a small one belonging to the Royal Institute of British Architects. There was no home for any remains of the innumerable buildings that were wiped away by modern changes. Every year the tribes of our Empire were dwindling, becoming extinct, or merging with their rulers. Our civilization had wiped out races at a greater rate in this century than in any other of the world's history. Yet there was no place where the remains of these peoples and of their civilizations could be preserved. At the beginning of the century the British Museum was begun in an airy suburb. At the end it was in the midst of square miles of houses, with land of high value around it. It was hopeless to suppose that such a site could be fit for the expansion of historical material. To say that nothing should be preserved that was not worth many pounds for each square foot was to destroy all hopes of progress. Yet we virtually did so by saying, "The price of preservation is £5 or £10 per square foot; perish all that is not worth so much." Two very different classes of buildings and of conservation were, in the lecturer's opinion, required. For valuable objects of which no possible deterioration must be permitted, and which must be safeguarded from risks of theft, such buildings as our present museums were admirable; but for rougher objects and things of small individual value a much less costly and elaborate system was needed. A fine site in a city, a noble building and costly glass cases were quite inappropriate to the greater part of the material which was to be kept and studied. The system to which the necessities pointed was that of long galleries, far apart, against which much larger annexes could be attached at any point. This might be called the gridiron pattern, and the building, of course, would need to be placed outside of London rents. He suggested that a square mile of ground should be obtained somewhere within an hour's train from London at a comparatively cheap rate. It would, in a generation or so, be to Greater London what South Kensington was to the Lesser London of fifty years ago. The village that would grow up round it might very appropriately be called, after the founder of the British Museum, the village of Sloane. The Sloane Galleries would soon outgrow any confusion with the little collection of Sir John Soane in Lincoln's Inn Fields. The lecturer worked out in considerable detail the form of the galleries, the cost, the arrangements for the staff, and the fittings, and said that at first the Sloane would be the clearing ground for freeing the existing museums from everything of small value and attractiveness. All that was absolutely required could be provided on the present system of expenditure if the British Museum were to be weeded during eight years of its more cumbrous and less valuable contents sufficiently to take in its new acquisitions.

LONDON'S GREAT NEW STREET.

ITS ARCHITECTURAL POSSIBILITIES.

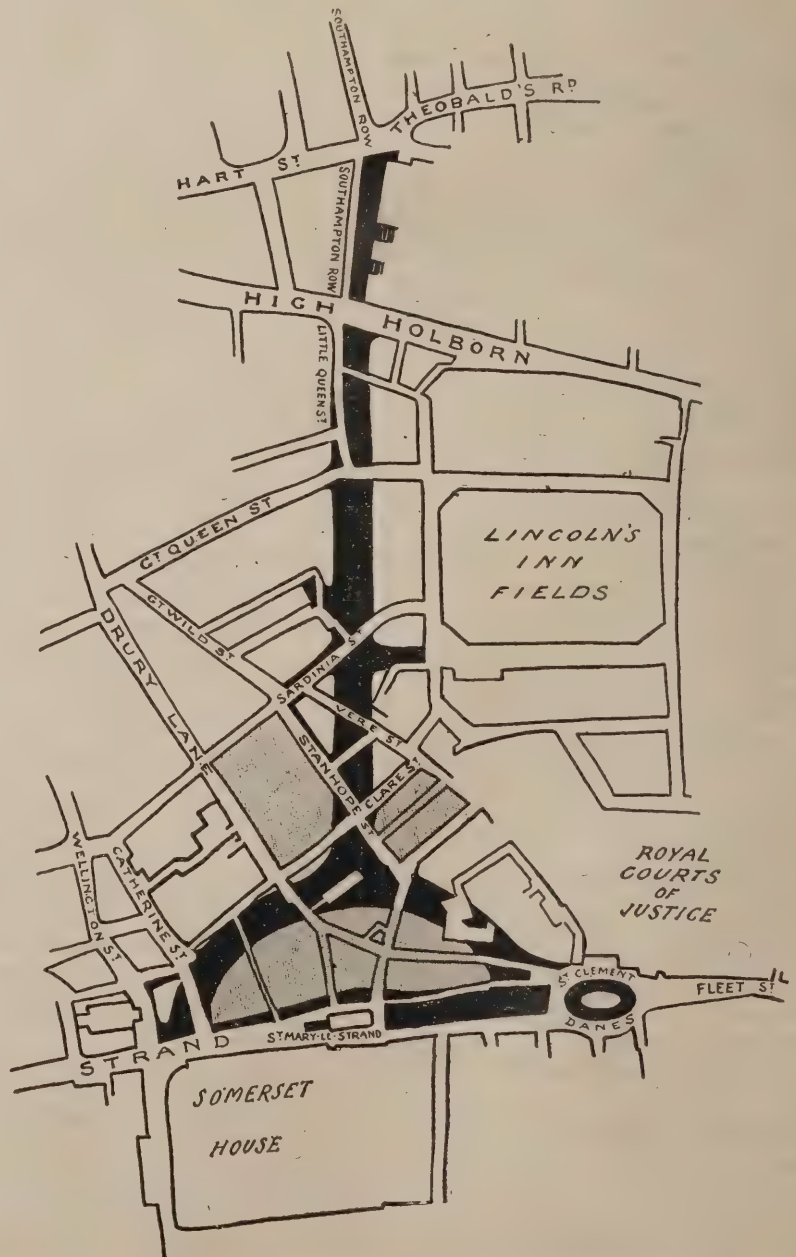

A MEETING of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Thursday evening last (Lieut.-Col. F. Seymour Leslie, R.E., A.S.E.A., vice-president, in the chair) to discuss the architectural possibilities of the proposed new street from Holborn to the Strand.

The discussion was opened by Mr. W. Woodward, A.R.I.B.A., who said: "There can be little doubt that the new thoroughfare—the clearances for which are now in operation, and which will extend from Southampton Row, Holborn, to the Strand—affords a grand opportunity for architectural display, besides meeting a crying want as regards vehicular traffic from the north to the south of London. Personally, I am pleased to be able to speak to-night of this new street, because in the 'Prize Westgarth Essay,' which I gained in 1884, and in the papers on 'The Reconstruction of Central London,' which I subsequently read before the Royal Institute of British Architects and the Surveyors' Institution, I proposed a similar new street from Southampton Row to the Strand, terminating in a large Circus at the junction of Wellington Street,

and so on to Waterloo Bridge. That street is shown on the plans which accompanied my essay and papers, and in referring again, now, to my plan, I am not by any means convinced that the London County Council plan is better, either as regards traffic or architectural possibilities.

The new street really commences at the junction of Vernon Place with Southampton Row, and up to that point Southampton Row is widened, on its eastern side, to give a width of 80ft.; thence, from Holborn, there is a straight street 100ft. in width, terminating near the present Olympic Theatre, and then, curving eastwards and westwards in a graceful crescent-like form, the street discharges itself eastwards at St. Clement Danes Church, and westwards at Wellington Street. The Strand between St. Clement Danes Church is widened, giving a width of 100ft. and more at the narrowest part and leaving the church of St. Mary-le-Strand standing, and to that extent only reducing the width I have mentioned.

In considering this new thoroughfare, one's thoughts naturally turn to the Continent, and we think of Paris, of Brussels, Berlin, Vienna, and Budapest. The Boulevard de Sébastopol, the Grand Avenue des Champs-Élysées, the Boulevard Haussmann, in Paris; the Boulevard Anspach and others in Brussels; the comparatively poor streets and avenues

THE NEW HOLBORN TO STRAND THOROUGHFARE. PLAN SHOWING PROPERTY TO BE DEMOLISHED.

of Berlin; the magnificent streets and avenues of Vienna; and that fine thoroughfare, the Andrássy Street, in Budapest. And, with all this before us, we see that, properly dealt with, we Londoners have a chance now of eclipsing, or at all events equalling, architecturally, any of the streets or boulevards I have referred to. First, as regards the very

Important Question of Width.

I think that 100ft., building to building, is sufficient for fine effect, without entailing the dangers and difficulties of getting across which attach themselves to all great widths. Portland Place has a total width, building to building, of 126ft., made up of open area on each side, 10ft. in width; footway and curb, 17ft. in width; roadway and channels, 72ft. in width. The width of this street is the more striking because of the low altitude to which the houses are carried. Northumberland Avenue is 90ft. wide, which strikes everyone as insufficient, because of the high buildings which front it. The Gray's Inn Road, as widened, is 60ft. in width. One important question, therefore, which the Council will have to decide is the maximum height they will allow the new buildings to be carried.

I assume that a subway will be formed under the roadway for the sewers, gas and water pipes, telegraph and telephone wires, &c., and the material for covering the roadway, as well as that for the footways, will require careful consideration. The question of electric, steam, or other tramways will engage the attention of the Council, and I must say that I hope, if electric tramways are permitted, they will not be worked on the overhead wire system. The position of the electric lamps, whether in the centre or at the sides of the road, or whether in the centre from wires attached to each frontage, will also be a matter of importance. The great crescent does, undoubtedly, on plan, lend itself to great architectural possibilities; the beauty of the curve and its junctions with the straight open up a fine field for design, and the splendid width and length of the straight street should prove material upon which the skilful architect could erect structures worthy of the occasion and of the Metropolis. There is

One Criticism

of the Council's plan which will probably occur to architects in this room, and that is that the straight part of the new street, instead of terminating at the crescent, should have been extended so as to open up the flank of the church of St. Mary-le-Strand as a central feature; this I have shown on the accompanying plan. Everyone with an eye for effect must have tired of the long lines of architecture, all from the same mould, which grace most of the Continental thoroughfares, and the Council will therefore, to be successful, carefully consider the question of dealing with the street in blocks, and making each block so far one harmonious whole, but not necessarily making each block like its neighbour. A certain amount of freedom in design and in detail must be permitted, but in the mass the general lines must be adhered to. As regards this very essential matter of design, great care and discretion must be used by the Council. They must not be so severe and work on such hard and fast lines as to drive away building lessees; they must not strangle the picturesque in order to produce what may prove to be dull monotony, and on the other hand they must not allow this grand opportunity to be lost by permitting all sorts and sizes of buildings and all sorts and conditions of details.

I suppose I need scarcely say that the Greenery Gallery and the Grosvenor Gallery and the Queen Anne and the Mary Anne will be tabooed, and I trust that the Council will put its foot heavily down on terra-cotta, and permit only Portland stone to be used in the fronts, as also in the chimney stacks and returns where left to be viewed from the streets.

On this question of architecture we all know that the Council, with a much-to-be-praised desire to obtain the best advice available, has decided to invite eight architects to send in

NEW STREET FROM HOLBORN TO THE STRAND

SUGGESTED ALTERATION BY W^o WOODWARD

TO OPEN UP THE CHURCH OF ST MARY-LE-STRAND.

designs for dealing with the difficult problems involved. Four of these the Council will themselves appoint, and four are to be nominated by the Royal Institute of British Architects. I do hope that the London County Council will insist upon the use of water pipes and sprinklers to prevent the great nuisance which arises from the pulling down and clearing away of old buildings."

Mr. W. R. Mallett, F.S.I., thought that the suggestion made by Mr. Woodward by which the church of St. Mary-le-Strand would complete the vista down the new street was a good one, though he did not see why a fine building could not be erected facing the end of the street as set out by the Council.

In the opinion of Mr. Ellis Marsland the Council were making a big mistake in choosing a select number of architects to design the new frontages, and it would have been better to have allowed building lessees to employ whom they wished, and then have had the designs submitted to a board of consultation. Referring to the height of the buildings, he said there was no indication to show what would be the depth, which would materially affect the height, but he thought a general height of 60ft. with two storeys in the roof would be satisfactory. This would not produce a street like Northumberland Avenue, which, though 90ft. wide, looked narrow on account of the tall buildings which fronted it. He objected to the scheme suggested by Mr. Woodward because it would give a view of the church of St. Mary-le-Strand which was never intended by the architect, who meant the church to be looked at from the west. It would be quite possible to have a monumental building opposite the end of the new street, and he thought such a site would be excellent for the Council's proposed hall. Besides, if the crescent were cut through as suggested, the traffic would go straight through and not divert in the manner particularly intended by the Council.

Mr. William Cooper regretted that the scheme was not thrown open to national competition, and, if it were not too late, he thought it would be advisable to petition the authority to make it national, and not restrict it to eight architects. He suggested that the crescent should be made more elliptical. With regard to the buildings, he

had always been struck by the opinions of foreigners, especially of Americans, about London, for they said that it was the most beautiful city in the world on account of its great variety. They did not want such monotonous uniformity as was seen in the buildings of Turin, for instance, and he did not think that the present architectural scheme would be satisfactory unless it was intended that all the new buildings should be of a monumental character, which was surely not the Council's intention.

Mr. R. Cromwell Edwards agreed with Mr. Woodward's proposal, but thought the street should be carried through as a footway and not as a carriage-way. He heartily concurred in prohibiting the use of terra-cotta, and pointed out that the flanks of the buildings should be finished in a proper manner, and not left in the rough manner now so common.

The chairman said it appeared that the elevations only were being considered, and he wanted to know what the buildings were to be used for—shops, offices, residential flats, or what?

Replying to questions Mr. Woodward said that it was the general opinion of the meeting that the limited competition was a mistake. He would have made it open to the world, and would not have been displeased even if a French or a Belgian architect were successful. The only way in which the Council could control the architecture was to stipulate that between certain points of the new street the buildings should be of one style, and between other points of another style. In suggesting the continuation of the street to the Strand he had in view a light and airy termination as opposed to a heavy one. In the matter of materials, terra-cotta seemed to him to be a hard, cast-iron material; it would not stand the London air, and showed a great change after fifty years' exposure, while Portland stone, as exemplified at St. Paul's Cathedral and the Horse Guards, weathered excellently. Nothing could be stated as to what buildings would be erected. The Council would have to wait for the building lessees. He thought that it would be better to build the proposed Hotel-de-Ville on a site near the Council's present offices at Spring Gardens, and not on a site facing the new street.

Lieut.-Colonel Probyn, who is a member of

the Improvements Committee of the London County Council, and who attended as a special visitor, said that, as the matters were now *sub judice*, he would need to speak with caution. But he would say that it was not the intention of the Improvements Committee, nor he believed of the Council, to impose upon lessees the employment of any particular architect, except in regard to the crescent portion of the new street. It might be in some persons' minds that the buildings of the whole street would be under the control of the selected eight architects. This was not so, and he assured them that while everything was being done to secure as fine a frontage as possible the greatest fairness would be extended to all concerned.

It might be mentioned in conclusion that this matter of the new street has been exhaustively dealt with in the "Architectural Review." In the number for December last appeared Mr. Mervyn Macartney's suggestions; in the March number the proposals of Mr. Norman Shaw, Mr. Reginald Blomfield, Mr. Halsey Ricardo, and Mr. Mervyn Macartney; and in the April number the opinions of Mr. T. G. Jackson, Mr. John Belcher, Mr. W. R. Lethaby, Mr. R. Weir Schultz, and Mr. Ernest Newton.

Surveying and Sanitary Notes.

The death is announced of Mr. George Dickenson, formerly town surveyor of Darlington, in his seventy-ninth year. For some years he carried on with his son, Mr. Joshua Dickenson, the practice of a surveyor and architect at Darlington.

Tender for Ludlow's New Sewerage Scheme.—The tender of Mr. J. A. Ewatts, of Warrington, amounting to £7,930, has been accepted for the new sewerage scheme for Ludlow. The lowest tender (£7,657) was sent in by Mr. Henry Roberts, of West Bromwich.

Sanitary Inspectors' Diploma.—The results of the examination held by the Sanitary Inspectors' Examination Board during the first week in May have just been announced. Candidates for the diploma of sanitary inspector required under the Public Health (London) Act of 1891 were examined orally and by written work, and were further required to examine and report on selected insanitary areas. The appended list gives the names of candidates who have passed the full examination and the institution at which each received instruction:—King's College: Mr. J. Johnson, Mr. J. Jones, Mr. A. W. Loughlin. Sanitary Institute and King's College: Miss E. S. Cann, Mr. J. I. Lonnon. Sanitary Institute: Mr. W. Brown, Miss E. A. McCleverty, Miss B. T. Orme. National Health Society: Miss M. K. Ede, Miss E. G. Gamble, Miss M. K. Long. Bedford College for Women: Miss M. O. Power.

The Mayor's Experiment.—The Mayor of Bradford has been trying a little sewage experiment privately at his house at Weeton, near Harrogate. Through the property there runs a drain which has suffered more or less pollution from a few of the neighbouring houses, and the Mayor was determined that if possible he would deal with the purification of this drainage effectively. Dr. H. Maclean Wilson, the chief inspector of the West Rivers Board, made certain suggestions which have been carried out by Mr. J. Wilcock, Mr. Lupton's architect, and which give every promise of a specially successful solution of the difficulty. The method suggested by Dr. Wilson was that of a septic tank and subsequent filtration. The sewage is led into a tank of about 600 gal. capacity, or sufficient for one day's flow. The tank is covered in and is air-tight, and here the microbes breed. From this tank the sewage is automatically syphoned out at intervals, and by means of a sparger it is distributed over the surface of a circular filter-bed, about 6ft. in diameter and about 5ft. deep. In this chamber the sewage is retained, and the filtered effluent is practically pure water.

Railway Charges for Builders' Materials, &c.—II.

By N. L.

(Concluded from page 266, No. CCLXXV.)

WHEN an article or a consignment is tendered for acceptance, it should always be closely examined, in order to ascertain that it is not broken or damaged in any way; before signing for it as having been received; or, if that is not possible, the words "not examined" should be added; but it is a common practice among many to sign for goods without seeing them. In the event of any loss or damage to goods they should either not be accepted, or accepted and signed for as damaged and a claim for the amount of the loss or damage sent to the railway company at once, excepting, of course, damaged articles carried at the reduced rate at owner's risk. Some companies are rather lax in dealing with correspondence relating to claims, and if nothing definite is heard it is well to remind them occasionally.

Exceptional Rates.—The exceptional rates for goods in which the builder is likely to deal are not difficult to understand. For most heavy goods, such as bricks, tiles, timber, &c., he is likely to find the exceptional rates hedged round with conditions, such as 4-ton lots, 4-ton loads, 2-ton lots, owner's risk, and, in goods from Classes 1 to 5, station to station (S to S) instead of collected and delivered (C and D). In the generic term of "hardware" (Class 3) most of his goods of that description are included, but not hollow ware, cast iron, nested and packed, Class 2; machines—(various), machinery—in parts in cases, Class 2; or files and rasps, Class 2. Builders' plant, described under "builders' implements" (which must not be new), comprises the following articles:—Barrows, centerings, crab winches, hoists, ladders, mortar boards, mortar mills, poling boards, pulleys, ropes, scaffold boards, steps, struts, trestles, wheeling pieces and planks, and windlasses; these are chargeable at the Class 1 rate. Timber is carried at the Class C rate, and, with a few exceptions, measurement weight is taken (being ascertained by calculating 66 cubic feet to the ton) of deals, battens and unprepared boards not exceeding 4in. in thickness of fir and pine, other than pitch-pine, which is calculated at 55 cubic feet to the ton. All light wood, such as chestnut, elm, fir, spruce and walnut, is calculated at 50 cubic feet to the ton, and heavy wood, like birch, green-heart, jarrah, mahogany, oak and teak, at 40 cubic feet to the ton. Posts and rails for fencing and paving blocks are calculated by actual machine weight. Deals, battens and boards of fir, pine, pitch-pine, also alder, ash, beech, birch, fir, hornbeam, larch, oak, pine, pitch-pine, plane, poplar, spruce, sycamore and teak sawn into planks or sawn and hewn into square or wany-edged logs, stavewood and lathwood, post and rails for fencing, and paving blocks, may be charged any exceptional rate noted for deals, battens and boards. Planed and prepared boards are charged Class C, or 10 per cent. over any exceptional rates for deals, battens and boards, but not to exceed Class C. Scaffold poles are charged 20 per cent. over Class C rate, or 20 per cent. over any exceptional rate noted for deals, battens and boards. When forwarding timber, the railway companies require that the number of cubic feet should be stated on the consignment note.

Insurance.—Under the Carriers' Act the railway companies are not liable for any damage to a few articles of a valuable nature unless they are insured, but the only one of interest to builders is glass, of all kinds. The charges for insurance are governed by the description. Plate glass of an area of more than 36 feet super. to the sheet, and stained, silvered and bent glass are in Division 4, and the insurance is about five times as much as that for any other kinds of glass, which are in Division 2. For instance, to insure glass worth £25 or less (any distance) in Division 4 is 2s. 6d.;

Division 2, 6d. From £26 to £50 in Division 4 is 5s.; Division 2, 1s. From £51 to £75 in Division 4 is 7s. 6d.; Division 2, 1s. 6d., and so on.

Returned empties are charged at a uniform rate on a mileage scale; thus, not exceeding 25 miles, 4d. per cwt. (minimum charge 4d.); 50 miles, 6d.; 100 miles, 10d.; 150 miles, 1s. 1d.; 200 miles, 1s. 4d.; 250 miles, 1s. 7d.; 300 miles, 1s. 10d.; and 350 miles, 2s. per cwt.; with minimum charges of 56lbs. and 6d.; but if the goods are going to or coming from a London station 2d. must be added to all these figures. Collection and delivery is included in places where such service is performed, but carriage must in all cases be prepaid. Returned empties must be from the same station and consignee to which and to whom they were carried full by railway, and to the same station and consignor from which and from whom they were carried full by railway. Returned empty china and earthenware crates are charged double ordinary rates, with a minimum charge for 56lbs. of 1s., except under 25 miles, which is 8d. A few of the smaller companies have a scale of their own for local traffic over their own lines.

In conclusion, I have tried to place the somewhat complicated matter of railway charges in as simple a manner as possible, but in these short articles it was obviously impossible to enter very fully into details; but I think sufficient information has been given, especially with the help of one of the books mentioned in the previous article, to enable any who may wish to go more fully into the subject to do so.

Builders' Notes.

Glasgow Building Regulations Bill.—This Bill (a summary of which is given on page 339 of the BUILDERS' JOURNAL for January 3rd last) has been passed by a Committee of the House of Lords on Unopposed Bills.

Scottish Timber Trade "Combine."—The new combine in the timber trade of the north-eastern district of Scotland includes Messrs. Fleming and Co., Ltd., Aberdeen; Bell and Sime, Dundee; and Thomson and Co., Glasgow. The shares will shortly be offered to the public.

A New Surveying Appliance.—The "orograph" is a new surveying machine made for the U.S. Army Engineering Corps. It is a species of bicycle drawn along the ground by two men, and it makes a profile of a road or stretch of country as though it were done by "chain and level." The apparatus is fully described in the "Scientific American."

London County Council.—At last week's meeting of the Council the tender of Messrs. Mowlem and Co., amounting to £92,680, for an additional northern outfall sewer was accepted. It was decided to spend £2,500 in laying out Archbishop's Park, at Lambeth. It was found that the expenditure of affording skilled mechanics the opportunity to visit the Paris Exhibition could not be justified.

Fire Tests.—The investigations undertaken by the British Fire Prevention Committee on Wednesday afternoon last comprised a test with two fire-blinds and a test with the so-called "Mack" partition. The test with the fire-blinds was intended to demonstrate the protection that could be afforded to windows and doors facing property in which there was an outbreak of fire, and which may be only separated by a small area or alley. This test was of one half-hour's duration. The partition test was to show the fire-resistance of a thin partition followed by the application of water, the test having a duration of one hour and a quarter, and the temperature ranging up to 2,000deg. Fahr. There was a large attendance of members and visitors at these tests, including many district surveyors and public officials, and prior to the testing operations the members of the executive and officers of the committee attended a luncheon in honour of Her Majesty's birthday; this luncheon will probably become an annual fixture.

Correspondence.

War Office Contracts.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, S.E.

SIR,—On Saturday, May 12th, a statement appeared in the "Times" newspaper to the effect that we had been removed from the list of contractors to the War Office for offences under the Corrupt Practices Act. The following paragraph appeared in the "Times" on Friday, May 18th, contradicting their former incorrect report:—

WAR OFFICE CONTRACTS.

In reference to the report of the proceedings of the Select Committee on War Office contracts which appeared in our issue of the 12th inst., we are requested by Messrs. Stiff and Son to state that they were not struck off the list of War Office contractors for offences under the Corrupt Practices Act. The evidence appears to show that a young member of the firm went to Woolwich and looked at some stores that were under inspection and had been rejected. In the course of his visit he offered small gratuities to the foreman and viewer, which, he said, he did for assistance they rendered him, and in ignorance, as he thought it was in the ordinary course of business, when people had done a service, to give them a little remuneration. The witness, Mr. Major, who was under examination, stated this act was held to be sufficient to justify a suspension, but it was only a suspension for twelve months, because it was known that Messrs. Stiff and Son were a very respectable firm who had done a great deal of good work. We regret any injustice we may have done Messrs. Stiff and Son.

We may add that out of nearly £7,000 worth of work executed for the War Office during the last six months, less than £10 worth has been rejected, these small rejections being partly due to damage sustained by the goods in transit from our works to Woolwich. A few articles were, however, rejected principally because the weight and size were not quite correct. These articles formed the first delivery on account of contracts now in hand, and our representative spent nearly an hour at Woolwich in ascertaining very accurately the exact requirements of the War Office. On leaving he innocently offered the foreman and workman who had assisted him small gratuities. The War Office have a stringent rule that no employee of theirs is to receive a gratuity on any account whatever, and to mark their displeasure at this breach of their rules they have suspended us from their list of contractors for one year. In view of the partial and incorrect accounts which have appeared in various papers, we venture to ask you to insert this complete statement of the facts.—Yours faithfully,

JAMES STIFF and SONS.

The late Sir George Gilbert Scott R.A.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—It is to be assumed that "C. G. H." is not old enough to remember the late Sir G. Gilbert Scott personally. Had he really known the greatest architect of the nineteenth century, he would have honoured his memory, and not sneered at him in the contemptible manner he does under the heading of "Restoring Doncaster Church" in your issue for last week. Sir Gilbert was neither grabbing nor grasping. He was a broad man, enthusiastic in his profession, a splendid general, and he possessed the happy knack of putting the right man into the right place. In the zenith of his fame, I recollect at his unobtrusive offices in Spring Gardens S.W., he had a staff of no less than thirty-six assistants, and these, taken as a whole, probably represented the very best Gothic men in the country. And the system that prevailed in those offices was simply marvellous. Contractors were never kept waiting by the hour, as was and is sometimes the case in minor architects' offices; details and everything else were always ready to the minute.

On this point Sir Gilbert offered striking contrast to the late Mr. George E. Street. Many a time I saw the latter in that upstairs office of his in Cavendish Place, W., standing at his desk knocking off large detail drawings—and beautiful drawings too—at the rate of a dozen and more an hour, but in spite of that and all his wonderful energy and

ability, Mr. Street was always behind. The most vexatious delays were constantly occurring "all over the shop" on Mr. Street's jobs, because the foreman or clerk of works in charge was "waiting for details." Mr. Street, as a rule, large as was his practice, drew all details with his own hand in pencil. Sir Gilbert aimed at nothing of the sort, but he had at his command splendid specialists who did what he wanted, and who, always in complete touch with their work, had everything ready as it was required. So far from "lacking time to perform his work with due care," he was an apt illustration of the old saying that it is the busiest man who has the most time. No architect I have known during the last forty odd years—and their name is legion—ever took greater pains to have everything thoroughly and conservatively worked out than did the late Sir G. G. Scott. Nothing was too little for him—nothing too big! His was the master mind, and he kept in touch with everything and everybody. When (from 1870 to 1877) he had the renovation of the interior of Exeter Cathedral in hand, he was frequently there, and was went to do his best to "dodge" the Dean and Chapter, so that he might have quiet converse with those employed upon the restoration. "There," he would say to the late Mark Brock, one of the best joiners who ever lived, "I have managed to get rid of them" (the Chapter), "now we can have a quiet hour together, and I shall learn something." And whilst learning he taught.

Very well do I remember his judging craftsmen's work and presenting the prizes one evening in 1864 at South Kensington Museum. An award was offered for the best miserere in oak. A splendidly-carved specimen represented a blacksmith shoeing a horse; it was exceedingly clever, and was the handiwork of a Scotsman named Kemure. We all thought he was sure of the prize, but Mr. Scott passed it over and gave it to a Taunton man called Seymour, who sent a miserere with a stone-mason at work at a banker carved upon it, which, as an actual work of art, was many degrees inferior. And this is what Sir Gilbert, then Professor, Scott said: "It may be considered Kemure's work is by far the best, and so in delicate manipulation it undoubtedly is; but in architectural detail we must always study utility. The shoeing smith would be valuable under a glass case; as a corbel it is practically valueless, for the first time that particular miserere was used the smith's hammer and the horse's detached and delicately undercut bridle would be broken off. The mason, with his stone and his upraised mallet securely attached to the ground of the projecting bracket, is, on the other hand, thoughtfully bossed, so that no amount of daily use can hurt it."

Remember, young men, that whatever work you do, must be thoughtful work. Grasp thoroughly what your respective task is, and that knowledge attained, go about it with all your might. That is one of the many lessons Sir Gilbert taught me years ago, and I am very grateful to him for it. The late Sir Gilbert taught workmen to think.

As for the matter of the stone decaying in places at Doncaster Church, built in the fifties, that is no fault of Sir Gilbert Scott. There is probably not a large stone building existing in England that was erected forty years ago upon which, to-day, defective masonry cannot be pointed out. If there is, I do not know it.—Yours obediently,

HARRY HEMS.

Architecture at H.M. Office of Works.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.C.

SIR,—It is a coincidence, although probably an accidental one, that the issue of your journal for May 16th contained two diatribes directed against those departments of the Government in which the architectural world is—or should be—most interested, against which it ceaselessly complains, and for the sins of which it fails to prescribe any remedial measure. Even the authors of the contributions referred to seem to content themselves

with adjectival averments which, even if accurate, leave matters at a standstill.

One cannot help regretting that the long letter on "Civil Service Appointments" (see page 265 of the issue mentioned) should be couched in such strong language. The truths which it contains necessarily fail to convince owing to the many statements made concerning the accuracy of which there cannot be entire unanimity of opinion.

It may be useful to confine our attention to one particular department, and probably the English Office of Works will prove the most interesting, since it possibly has called forth more criticism from the architectural profession than any other branch of the service. Owing to the many important buildings for which this department is responsible, it seems imperative that architects as a body should not content themselves with adverse criticism, but formulate a definite petition to right some of the wrongs which obviously exist.

Primarily, one would point out the harm of the present examination system for "2nd class surveyors," which appellation in itself seems an insult to any architect who wishes to join the permanent staff of the Office of Works. Until quite recently only the most superficial knowledge of architecture was necessary to enable the candidate to be successful in this examination, the result being such an alarming collection of surveyors, in the literal sense of the word, that even Government officials grew frightened and instituted an examination which necessitated some knowledge of architectural style and design. The first essay in this direction has been a deplorable failure, only three candidates presenting themselves. Of these three two failed entirely, whilst the remaining one barely managed to obtain the requisite half-marks in compulsory subjects.

Surely the time has arrived for the "powers that be" in the Office of Works to recognise the futility of examinations if they wish to obtain architects on their permanent staff?

The current number of "A. A. Notes" contains an article by Mr. Bulkeley Cresswell which deals with examinations in architecture; some of the remarks which occur in the course of the paper seem so pertinent that one ventures to apply them to the case in point. "An examination to qualify architects would reduce to an absurdity the established theory of education in this country. . . . Even if the test of memory, which is the test chiefly comprised in examination, were a sound and truly discriminating test in such positive subjects as law and medicine, it would still remain utterly fatuous to apply it in the case of architecture. . . . In every building each moulding drawn and each nail driven for the reason and by the mere knowledge, that it has been so done before is a contribution to the sarcophagus of architecture."

Such sentences, directed as they are against the general principle of qualifying architects by examination, appeal with additional force against examinations held by a department which already employs a presumably fully qualified architectural staff. One is aware of the fact that this staff is not officially recognised, that its members are called "temporary draughtsmen," and that theoretically the surveyors who have passed the examinations already referred to, in which architectural knowledge was considered superfluous, are responsible for the designs which emanate from the office.

The pretence of the past, however, has proved a failure, and if it is the desire of the chief of Office of Works to improve their architecture, one would suggest to them the desirability of improving the status of the architects they employ. What inducement at present exists to tempt a good designer to join or remain in the Office of Works? The highest salary he can ever hope to obtain is £312 a year; he is practically a weekly hiring and liable to seven days' notice of dismissal. Is it therefore wonderful that men of ability prefer to go to private firms or such bodies as the County Council, where they have chances of promotion?

The object of this letter has been to suggest some remedy for the ills that exist in the Office of Works, in order that the public may obtain

better architecture, and architects have less cause of complaint. It is, however, obviously impossible to do more than shadow forth a possible solution of the difficulty; one would like to see some of the prominent members of our calling memorialize the Chief Commissioner of Works, also Lord Esher and the Chief Surveyor of the Office of Works, who, fortunately, happens to be an architect, a Fellow of the Institute, and a member of its Council; one would like to see this sorry farce of a surveyors' examination dealt with as it deserves; and one would like to see young architects eager and proud to design Government buildings which should be a credit to our country and our craft.—Yours truly,
H. S. M.

“BUILDERS’ JOURNAL” SHILLING FUND.

BUILDING OPERATIONS BEGUN.

WE have received several further donations towards this fund, and shall publish our final list next week. Our readers have responded very liberally to our appeals, but we hope to receive still further contributions during the last few days our list remains open. Will all our friends kindly remember that Monday next, June 2nd, is the day on which we have decided to close the list? We should be glad to receive any outstanding collecting forms not later than the first post on that day. We give this week a few particulars of the progress of the general scheme with which our fund is connected.

Building operations on the Homes for Disabled Soldiers, presented by the Building Trades Gift, have just been commenced by Messrs. George Trollope and Sons, the well-known builders, who are kindly executing the work on behalf of the donors. A special light railway connection has already been formed between Bisley Station and the site so generously presented by Lord Pirbright, which lies to the east of the Ranges on the Stafford Lake Road, so that rapid progress can be made with the building operations.

About £6,000 in money is still required to complete the scheme for accommodating one hundred men, and collections have now been commenced throughout the Midlands and Yorkshire, which example of provincial effort it is hoped will be soon followed in other districts. All offers of assistance, whether in money or in kind, should be addressed to the Executive at 1, Waterloo Place, Pall Mall, S.W.

The Printing Arts Company Ltd., of Holbein House, 119, 121, 123, Shaftesbury Avenue, W.C., send us a copy of a little booklet containing Kipling's well-known war verses, illustrated by sketches by Gordon Browne, W. Hatherell, Stanley L. Wood, Frank Dadd, and Frank Craig. The feature of this publication is that it is the first issue from the Orloff Press in England, all the colours being printed at one operation, and not in succession, as is usual. Twice through the six-colour machine produces the same result as twelve times through an ordinary colour press. There are 100,000 copies of the booklet to be had at one shilling per copy, of which threepence (that is, the publishers' profit) will go to the “Daily Mail” Absent-minded Beggar Relief Fund.

Mr. T. F. Rider, Past-President National Association of Master Builders, as Honorary Secretary to the Gift, announces the following further contributions which have come to hand this week:—

SUBSCRIPTIONS.

	£	s.	d.
The Derby Master Builders' Association, per concert	50	0	0
Mr. A. Wright, being the proceeds of a concert	50	0	0
The Carpenters and Joiners of Wolverhampton, per Mr. W. Vincent Vale...	29	16	1
Workmen of Messrs. Dent and Hellyer	7	11	6
Workmen of Messrs. James Styles and Son	5	6	6
Messrs. James Styles and Son	5	5	0
Messrs. James Day Burchett, Ltd. (Ealing)	5	5	0
Mr. T. D. Grady (Bromley, Kent)	5	5	0
Mr. Lansbury (Bromley, Kent)	5	5	0
Messrs. Peill and Sons (Bromley, Kent)	5	5	0
Messrs. Darby Bros. (Bromley, Kent)	2	2	0
Mr. G. Lovelock (Beckenham)	2	2	0
Workmen of Mr. William Willett (Chelsea)	2	2	0

ROYAL CORINTHIAN YACHT CLUB HEADQUARTERS AT PORT VICTORIA. HENRY OUGH AND SONS, ARCHITECTS.

Professional Practice.

Bradford.—The foundation-stone of the Cartwright Memorial Hall in Manningham Park was laid by Lord Masham on Thursday last. With our issue for May 17th, 1899, we published plans and elevations of the first and second premiated designs, the former by Messrs. J. W. Simpson and J. Milner Allen, of London, and the latter by Mr. A. R. Jemmett, also of London; and in the same issue appears a critique of the drawings sent in for the competition. The architects' estimate of the cost at the time, just about twelve months ago, was £37,073 8s. 3d., but when, quite recently, tenders were asked for, it was found that such had been the advance in the cost of building material and labour that the original design could not be carried out, including architects' commission, &c., for less than £55,000. When this was discovered, it was proposed to alter the plans with a view to making them less expensive, but in the end it was agreed that the plans as accepted should be carried out and that the extra cost should be equally divided between the Corporation and Lord Masham. The accepted design is a type of Italian Renaissance, based on the order of coupled Ionic columns and pilasters, with appropriate entablature, standing upon a suitable basement of rusticated rockwork, suitable for a building placed in a park. An open carriage porch, surmounted by a lantern, supplies relief without interfering with the proper and economical lighting of the galleries, or breaking the lines of the roof-lights over them. Ornament is sparingly used, being massed at points where it will be most effective. The statue of Sir Titus Salt will form a centre of the main approach, an intermediate space being laid out as an Italian garden, with bandstand and spacious promenade, while the differences in the levels between the new gardens and the present flower-beds allow the latter to be formed into an upper garden, flanking the building and connecting its severe lines with those of the garden immediately surrounding it, and with the undulating park beyond. In the hall itself the whole of the first floor galleries will be grouped *en suite*, so as to form one continuous range of reception rooms, with a reception hall and the main stairs in the centre, double sliding doors permitting separation when desired. Cloakrooms are placed on the right and left of the entrance

vestibule. The grand staircase in duplicate is open to the central hall and leads direct to the reception hall. The drawing room is placed between the reception hall and banqueting room, as a convenient waiting position for the guests at banquets; the black and white room will be valuable as a private drawing room for distinguished guests after passing through the reception hall. The lighting of the whole suite of galleries and reception hall will be by double top lights, on the system recommended by the late Sir John Millais, P.R.A. The central hall, however, is lighted by high north windows, these being preferable to the direct top light for sculpture, as well as giving a finer internal effect. On the ground floor there are two spacious museum galleries, and other rooms, with a floor space of 4,806 superficial feet. The secondary entrance is placed at a half-level between the basement and the ground floor, giving convenient access to both the central hall and the refreshment room, but there are no separate entrances from the park to the refreshment room. The exterior and the interior of the central hall and staircase will be faced with approved white stone; the roof will be covered with slates and lead where not glazed, and the whole rendered as far as possible fire-proof. The entrances to the main body of the building will be carefully air-locked, and no windows will be made to open. Fresh air will be taken from a point at the roof level, and means are provided by which the air inside the building will be kept uniformly pure and at a regular temperature, and dirt, fog, and smoke being excluded. The total picture-hanging wall area will be 6,948 superficial feet, and the area to be occupied by the building 14,162 superficial feet.

Norwich.—The new Jenny Lind Infirmary for Sick Children, which is to be formally opened by the Prince and Princess of Wales at the end of June, has been designed by Mr. E. T. Boardman, and is approached from the city by way of Unthank Road. In some general sense the plan of the new infirmary resembles the letter Y. The branches of the letter are the wards, while its stem comprises the administration block and the domestic offices. The branches, however, are widely extended, for while the distance from the portico to the end of the domestic offices is 125ft., the extremes of the two wards, measured in a direct line, are separated by no less than 268ft. The portico runs up through

the whole of the three storeys, having square bays on each side of it, and terminating in a gable and finial. On the right of the main entrance is the board room, which measures 22ft. by 16ft. On the left are the visitors' room, the matron's sitting-room, and a large dining room for nurses, the last being of the same dimensions as the board room. On the two upper floors are the bed and sitting rooms of the nurses. Behind the administration block comes the domestic block, which is of two storeys and comprises kitchen, scullery, larders, pantries, work room, laundry and coal-house on the ground floor, while on the floor above are the servants' bedrooms and bathrooms. The wards are approached by means of corridors 7ft. wide branching off from the back of the administration block. At the outer end of each ward is a day room with movable shutters, so that under favourable conditions the children can go out and enjoy the air and sunshine. The operating block branches off northwards of the east ward, and comprises operating room, anaesthetic room, and lavatory. In the wards and the operating block the corners have all been rounded away. In the corridors there is a high dado of glazed brick, and in the wards one of glazed tile; and under both wards and corridors there is an open passage, so that access can be had to the heating, lighting and other fittings without interruption to the routine of the infirmary. As the result of prolonged enquiries concerning the material that best adapts itself to cleansing, the flooring in all the wards, corridors, and halls has been marbled on the Terazzo system. The site for the building was given by the late Mr. J. J. Colman, and the builder's contract, including the furnishing, heating and electric lighting, but excluding the fire hydrants, the laying out of the gardens, and the making of the approaches, was £12,000. The old infirmary accommodated twenty-six cots. The new one has room for fourteen more, or forty in all.

Nottingham.—Arrangements for commencing the proposed new Gordon Memorial Home are making substantial progress. An admirable site was secured time ago in Cranmer Street; it has an area of 1,754 sq. yds. and a frontage of 83ft. The selected designs are by Mr. E. R. Sutton. The buildings will be in the Georgian style, with red brick facings and moulded stone strings and cornices. The windows on the front will have stone mullions and transoms, and the main entrance will have rusticated columns with carved frieze, while

the boundary wall is to be of dressed Bulwell stone, with moulded stone coping. There will be two entrances in the boundary wall facing Cranmer Street, with wrought-iron gates. The Home when completed will accommodate 104 boys, but it is intended to provide at first accommodation for only seventy-two boys. On the basement floor will be a large recreation and drill room, boys' library and writing room facing the street, cloakrooms, day lavatories, and boot cleaning and brushing rooms, with the heating chamber and a cart and barrow house at the rear. On the ground floor will be the dining hall, with the kitchen, scullery, &c, adjoining. The committee room, office, and waiting room are to be on the south side of the principal entrance, and the manager's and matron's rooms on the north. On the first floor accommodation for thirty-six boys is provided in two dormitories, with lavatory and bathrooms adjoining. The manager's, matron's, and staff bedrooms are also on this floor. On the second floor will be similar dormitory, lavatory and bathroom accommodation, with a hospital or sick room, having bath and lavatory communicating. At the back of the main building a small laundry will be erected. The heating is to be by hot-water pipes, radiators, and open fireplaces, and the ventilation will be carried out by fresh air inlets and extractors. The total cost of the building (for accommodating seventy-two boys) is estimated at £5,000.

Port Victoria.—The new headquarters of the Royal Corinthian Yacht Club, of which a perspective and plans are given on this and the preceding page, was opened by the Commodore of the Club on Saturday, May 5th. The site faces the Medway, and the building has cost about £5,000. The architects were Messrs. Henry Ough and Son, of 64, Basinghall Street, E.C., and the contractors Messrs. West Brothers, of Strood, Kent. The foundations being on river mud were very difficult to deal with, and the building had to be floated on cement concrete. It is framed of baulk timber with steel stanchions and girders to carry the floors over the large spans, and filled in with steel lathing and cement plaster, faced with pebbles. There is a landing pier for boats opposite the principal entrance. On the ground floor is a large entrance hall and staircase, a club-room accommodating 200 persons, library, ladies' room, billiard room and lavatories; kitchen, bar, and serving rooms adjoin the club-room. The basement is fitted as a boat-house. On the first floor is sleeping accommodation for thirty members, with bath and lavatories; also steward's

quarters, reached by a private staircase from the kitchen. On the second floor a smoking room and look-out is provided, commanding an extensive view of the Thames and Medway estuary. The premises are lighted by acetylene gas.

Masters and Men.

The Ayr Joiners' Strike has ended by the masters agreeing to continue the old rate of 9d. per hour, and not reduce it to 8d.

The Hamilton Masons have had their wages reduced from 9½d. to 9d. per hour, to take effect from the month of August next.

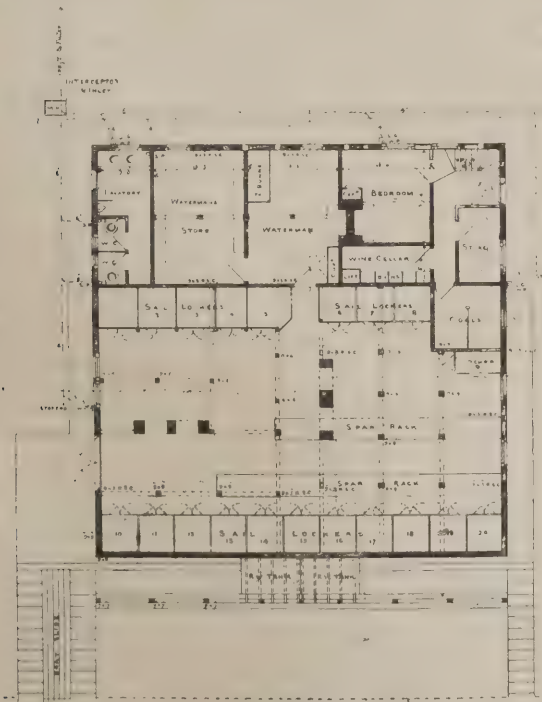

The Builders' Labourers at Beccles have struck for a rise of ½d. per hour on their wages on the present rate of 3½d. per hour, fifty-nine hours per week.

The Norwich Operative Bricklayers' Society served a notice on May 1st last on the Association of Master Builders, demanding an advance of 1d. per hour on their present rate of 7½d., and a reduction of hours from fifty-six to fifty-two and a half per week. The masters have refused to comply, and work will presumably cease on June 1st, when the customary three months' notice expires. About 400 men are affected.

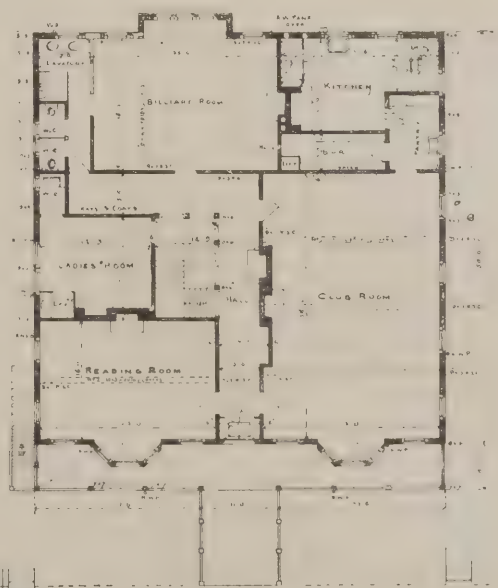

A new East Window at Thaxted Church, Dunmow, has been erected. It is by Mr. C. E. Kempe and is in the fifteenth century style.

A new Meat Market at Douglas, I.M., has been erected from the designs of Mr. T. G. Taylor, late borough surveyor, under the superintendence of Mr. Prescott, the present borough surveyor. Mr. W. J. Fargher was the contractor.

A Successful Lady Architect.—The plans of two buildings to be erected at Marshall, U.S.A., for the State asylum will be drawn, and the specifications furnished, by Miss Mamie Hale, of Columbia. Miss Hale has been selected as the architect by the Board of Managers, and she will have entire charge of the important work from the beginning to its completion. She will visit similar institutions in Pennsylvania, New York, and other states, with the object of getting the latest improvements. Miss Hale is well known professionally; the Christian College building at Columbia was built from her designs and under her supervision.

BASEMENT PLAN.

GROUND FLOOR PLAN.

ROYAL CORINTHIAN YACHT CLUB HEADQUARTERS AT PORT VICTORIA.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Repairing Bridge Piers.

APPLEBY.—PORTO RICO writes: "An iron bridge, with stone piers, having given somewhat on the up-river side of the middle pier, and crumbled at the cut-water, I consulted a bridge-master, who recommended that 'an air-tight wooden frame should be constructed the exact shape of the cut-water, sunk to the bottom of the river, and filled with cement concrete. The frame need not be more than 8in. wide.' Can you advise me as to best method of constructing it, size of materials, mode of preventing the breaking-up of the frame in filling and sinking, and how to remove the frame when concrete has set? The pier is 5ft. 3in. wide and 6ft. from bed of river to set-off at water-line."

The proposed wooden casing and concrete would not be a very satisfactory method of

repair. It would not strengthen the pier, and would have very little strength to resist collision by river craft. Either the defective stonework should be cut out and renewed in order to preserve the structure, or if the whole structure has been weakened by collisions and it is not desired to rebuild it, protection against further damage may be obtained by driving three piles as a starling, and bracing them together as shown in the accompanying illustration.

HENRY ADAMS.

Rust on Straight-Edges.

SILESSEN.—H. H. writes: "Could you tell me how I can keep steel straight-edges free from rust, and how I can remove the rust from one which has not been in use for some time? I have been recommended to use vaseline, but it is a great inconvenience having to remove it before using the straight-edge."

The obvious way to keep a straight-edge free from rust is to keep it in a dry place. If this is done there should be no trouble. A piece of lime is often placed in a tool-box to absorb any moisture in the air and so prevent the iron or steel tools rusting. To remove rust, some Bath-brick dust and paraffin will be found as effective as anything. With regard to the vas. line, our correspondent has

evidently been putting it on the straight-edge too thickly; it need only be smeared on with the finger, and the tool will not then be in such a condition that it has to be wiped before use.

Equivalent Weight on Beam.

KING'S NORTON, near BIRMINGHAM.—F. E. T. writes: "A beam of 20ft. span is loaded at three points; at the first point with 6cwt, at the

EQUIVALENT WEIGHT ON BEAM.

second with 8cwt., and at the third with 10cwt. The first point is 5ft. from one end of the beam, and the second point is 7ft. from the same end, the third point being 8ft. from the other end of the beam. Calculate the equivalent weight at the centre of the beam."

$$\text{Reaction at B} = \frac{6 \times 5 + 8 \times 7 + 10 \times 12}{20} = \frac{30 + 56 + 120}{20} = \frac{206}{20} = 10.3 \text{ cwt.}$$

$$\text{Reaction at A} = \frac{10 \times 8 + 8 \times 13 + 6 \times 6}{20} = \frac{80 + 104 + 36}{20} = \frac{220}{20} = 11.0 \text{ cwt.}$$

Bending moment under 6cwt. load = $13.7 \times 5 = 68.5 \text{ ft. cwt.}$

Bending moment under 8cwt. load = $13.7 \times 7 = 95.9 \text{ ft. cwt.}$

Bending moment under 10cwt. load = $10.3 \times 8 = 82.4 \text{ ft. cwt.}$

As the beam is assumed to be of uniform section, and the maximum present bending moment is 95.9 ft. cwt., a central load is required which shall produce the same bending moment.

$$\therefore \frac{\text{Max. bending moment}}{\text{half span}} = \frac{95.9}{10} = 9.59 \text{ reaction on each side.}$$

$$\text{Reaction} \times 2 = \text{central load} = 9.59 \times 2 = 19.18 \text{ cwt.}$$

HENRY ADAMS.

Moulds for Casting Composition Ornaments.

LONDON, N.—FOREMAN writes: "I have heard that there is a metal used as a substitute for sulphur and plaster moulds for casting 'paste composition.' Please inform me how this mould metal is made; also if the moulds require oiling."

Sulphur moulds for casting composition ornaments are made with a combination of sulphur and metal filings. The moulds are then let into wood blocks and bedded with plaster or cement to enable them to resist the screw pressure which is necessary to consolidate the compo. Iron frames, or cases, are also used to strengthen sulphur moulds. For stock models, as used for the decoration of furniture, mirrors and wood panelling, the moulds are carved "in the reverse" in box-wood or pear tree. This is an expensive method and is only used for stock work or for special designs. Spence's metal, a generation back, was largely used as a fusible metal for making moulds for casting composition; also cement work. This metal is now superseded by "Phelps' Metal," which, stronger and in every way more suitable for plastic purposes, does not rust and is acid-

All 9" x 9" timbers

REPAIRING BRIDGE PIERS

proof. It melts at about 300deg. Fahr., and it can be re-melted and used again as often as required. It can be cast on or in gelatine or carton-pierre. The moulds are oiled with ordinary lubricating oil, or with a combination of sweet oil and paraffin oil in equal parts. This metal is also useful for a variety of building purposes. For further details, apply to Phelps' Metal, Ltd., Suffolk House, Laurence Pountney Hill, Cannon Street, London, E.C.

How to Become an Architect.

PORTSLADE, near BRIGHTON.—F.N.R. writes: "Will you kindly tell me what subjects should be studied by someone wishing to become an architect, but having only spare time in which to study? Kindly recommend a book on the subject."

It would be the reverse of a kindness to our correspondent to comply with his request. The study of good books is of very great value to one who intends to practise as an architect, but no one can become an architect by such means alone. Some years must necessarily be spent in an architect's office, slowly acquiring the routine, and practising drawing, tracing, and planning under the conditions of actual everyday work. Supplementary to this, study is most important, and is preferably graduated to meet the requirements of the R.I.B.A. Preliminary, Intermediate and Final Examinations in sequence, particulars of which are to be obtained from the Secretary R.I.B.A., 9, Conduit Street, W. G. A. T. M.

Books on Wood-Turning.

OXFORD.—G. G. writes: "I should be much obliged if you would tell me the name and publisher of a good book (or books) on wood-turning suitable for beginners."

"The Wood-Turner's Handybook," by Paul N. Hasluck, price 1s.; "Turning" (a book for beginners), by Francis Campin, price 3s. 6d.; "Wood-Turning for Beginners," by the Rev. F. C. Lambert, 7d. (Dawburn and Ward, 6, Farringdon Avenue, E.C.). These books can be obtained post free at the prices named from B. T. Batsford, 94, High Holborn, W.C.

Style of Finial.

HUDDERSFIELD.—DISPUTE writes: "Please say whether the enclosed detail of finial is of Classic or Gothic architecture, and so settle a dispute as to its use in some Classic work. If Gothic, what period?"

The finial referred to belongs to no known architectural style or period. It is nothing more than a very bad piece of modern detail, such as is sometimes to be seen in a book of stock patterns.

G. A. T. M.

Lending Library for Technical Books.

APPLEBY.—DOUGLAS CRAIG writes: "Do you know of any lending library, such as Smith's or Mudie's, where technical works can be obtained by country members by post or parcel delivery? If so, can you give particulars?"

There is no lending library where our correspondent can obtain technical books in the manner he wishes. A certain number of these books can of course be obtained from ordinary public libraries in the usual way.

Engineering Notes.

Fratton Bridge, Portsmouth, is proposed to be widened.

Hot Water for Artisans' Dwellings.—The Local Government Board have sanctioned the borrowing by the Liverpool Corporation of £1,400 for the provision of a hot-water supply to the houses to be erected in Dryden Street and Rachel Street.

"Transbordeur" Bridge at Newport, Mon.—The Bill dealing with this proposed bridge (particulars and illustrations of which will be found in our issue for January 10th last) came before a Select Committee of the House of Commons last week.

New Bridge at Lancaster.—A new bridge has been erected over the Lancaster and Preston canal in Penny Street, Lancaster. The old bridge had served one hundred years, and was 34ft. wide. The new bridge is 59ft. wide at its narrowest part, and opens out to 80ft.

The Sheffield District Railway was formally opened last week. It connects Sheffield with Lancashire, Derbyshire, and the East Coast route to the Dukeries, and provides an alternative route to London by the Great Northern and Great Eastern systems.

Death of the Kidderminster Borough Engineer.—Mr. Arthur Comber, the borough engineer of Kidderminster, died on Saturday morning after a prolonged and severe illness. Mr. Comber was forty-nine years old, and had been in the service of the Corporation twenty-seven years.

Public Works at Keighley.—On Wednesday last a Local Government Board enquiry was held at the Municipal Offices, Keighley, into an application by the Corporation for borrowing powers as follows:—£45,000 for works of electric lighting; £10,300 for the provision of a Town Hall; and £8,565 for street improvements.

Middlesex Light Railway.—The Light Railway Commissioners held an enquiry last week into an application by the Middlesex County Council for permission to construct lines of electric tramways from Harlesden, through Sudbury, Wembley, and Harrow on the one side, and from Southgate to Finchley on the other. The total length of the lines is about seven miles, and the cost of construction and equipment is put at £117,000.

New Pier at Southwold.—The new pier which has been erected at the northern end of Southwold, almost in a line with the railway station, was designed by Mr. W. Jaffrey, M.I.C.E., and constructed by Messrs. A. Fasey and Son, contractors, of London, with Mr. F. Hunter acting as clerk of the works. The pier is nearly 900ft. long, and has cost about £8,000. It is the last part of the Coast Development Company's scheme. Some time ago this company purchased the Town Farm Estate from the Corporation, and it is now being laid out for building purposes by Mr. J. C. Trueman, of Swanley Junction. On a site facing the sea the Grand Hotel is being built at a cost of £20,000; the architect is Mr. C. H. M. Milcham, of Lincoln's Inn Fields.

Cardiff's New Dock.—The new Bute Dock at Cardiff will be 50 acres in extent and 56ft. deep, making it the deepest dock in the country. It will be 2,500ft. long on the quay walls on each side, and 300ft. wide, except near the junction to the Roath Dock, where it extends to 1,050ft. to facilitate the swinging of large steamers. The lock will be 900ft. long and 90ft. wide. Two graving docks 800ft. in length will be made alongside of it. The walls of the dock are 24ft. wide at the bottom and taper off to 12ft. at the top. It is expected that the whole of the work, which will cost about £1,500,000, will be completed in the early part of 1902. At the present time about 1,600 men are employed on the work. Messrs. Topham, Jones and Railton are the contractors.

London Water Intercommunication Scheme.—At the Guildhall, Westminster, last week, Mr. Charles Perrin, water examiner

to the Local Government Board, held an enquiry into the scheme of intercommunication between the works of the London water companies which has been proposed in accordance with Mr. Chaplin's Act of last year. Mr. Lawrence, in opening the proceedings, said the scheme had received the sanction of the Royal Commission and had been provided for by the Legislature, so that in principle at all events there could be no sound grounds for opposition to it. There were eight companies in the metropolis, each of whom had a separate district of supply, and it was evident that it was in every way advisable to have some means of allowing the resources of all to be at the service of each when emergency or accident demanded it. The scheme provided for the utilisation of the Battersea works as a central station, and provision of pumping plant and filter beds at Hampton. The estimated cost of the whole scheme would be £627,987, and of this £155,754 had been already expended. Under this scheme an approximate quantity of ten million gallons a day could be supplied, if necessary, to the Chelsea Company, twenty millions to the East London Company, nineteen millions to the Grand Junction Company, twelve millions to the Kent Company, eighteen millions to the Lambeth Company, twenty millions to the New River Company, twenty millions to the Southwark and Vauxhall Company, and nineteen millions to the West Middlesex Company.

The Great Alpine Tunnels was the title of a lecture by Mr. Francis Fox at the Royal Institution last Friday evening. After briefly describing the manner in which tunnels were constructed, explaining in particular the precautions taken to ensure that the two driftways should exactly meet in the middle, he dealt with the Mont Cenis, the St. Gothard, and the Simplon tunnels, stating details of their length, gradients, &c. An interesting account was given of the difficulties encountered in securing ventilation, and of the plan by which they were overcome in the St. Gothard. Here the Saccardo system was installed, a ventilating fan near the mouth of the tunnel blowing in air through the annular space between the arch and the gauge of maximum construction. Plans were now being prepared for fitting the Mont Cenis tunnel with this system, which had also proved successful with the Pracchia, the worst tunnel between Bologna and Florence. Another interesting point was the temperature of the rocks passed through in the construction of a tunnel; this was found to depend on the character of the rock, the inclination of the beds, and the height of the mountain above the tunnel. For each 144ft. of superincumbent rock the increase was 1deg., Fahrenheit. With regard to the Simplon tunnel, now in course of construction, the lecturer said its total length would be 12.26 miles, of which at the end of last month 3,228 yards had been driven on the north side of the Alps, and 2,350 on the south—that was, three miles in little more than eighteen months. The time in which it was estimated to be completed ready for traffic was five and a-half years, and there was a penalty or bonus for delay or acceleration of £200 a day. The undertaking consisted of two single-line tunnels, parallel to each other, and one of its chief features was its low altitude above the sea; at its highest point it was 1,474ft. lower than the St. Gothard, 1,934ft. than the Mont Cenis, and 1,986ft. than the Arlberg.

The Death is announced of Mr. Alexander Christie, manager of the Seaton Brick and Tile Co., Limited, Aberdeen.

A School on Barry Island has just been completed from the designs of Mr. G. A. Birkenhead, architect, of Cardiff. The building is ventilated on the Plenum system.

An Architect's Gift.—Mr. Charles Ower, architect, has made a donation of five guineas for the purchase of architectural works for the Dundee Library. Further, he has intimated that he will make a similar donation for the same purpose on every anniversary of "Mafeking Day." There are few men so practically patriotic as Mr. Ower.

IN WHAT STYLE IS THIS FINIAL?

Under Discussion.

The Influence of Architecture.

At the recent annual meeting at Exeter of the Devon and Exeter Architectural Society the retiring president, Mr. C. King (Plymouth), took as the text of his address "The permanency of our work and its influence for good, or otherwise, upon the public mind." The profession, he said, had a hopeful future if we rightly used the inheritance which was ours to-day. The great enemy in the provinces had been in the past the slight knowledge the general public had acquired of the true principles of beauty in architecture, chiefly owing to the local dearth of that which was beautiful, the few sources of education and inspiration, and the resting satisfied with comfort or convenience, however barren the art. But the professional and non-professional educator was abroad to-day with cheap and good illustrations of the beautiful and admirable in architecture, painting and sculpture, and these, in addition to the travelling facilities provided for visiting places of interest all over the world, would be bound to exercise an influence for good and create a desire for better results. Mr. King said he was a firm believer in the refining influence upon character of the beautiful in art, and if we once thoroughly realised that our work was to be permanent—not merely a question of so many pounds, shillings, and pence earned to-day, but to be seen, enjoyed and admired or condemned by present and future generations, exercising upon them a refining and elevating influence, or the contrary—we had an ennobling ambition encouraging us to careful study, thoughtful application, and the production of our best, not restricted by the value of fees. Many were probably discouraged when they found how few, if any, were the opportunities for distinguishing themselves, or showing what they could do; but he for one was not prepared to give honour only to those who had designed and erected noble and beautiful ecclesiastical, imperial, municipal, or other large buildings of a public or private character, but rather to the man who, utilising the means, however small, placed at his disposal, exercised his talents successfully. It was not what we might have done if ten thousand pounds had been placed at our disposal for some building upon which only five thousand could be spent, but had we succeeded with the smaller sum as far as it would go, and realised a building answering in all respects to the purposes for which it was erected? The pleasure we ourselves enjoyed in the various beauties of our ancient buildings should be a strong inducement to us to hand down to posterity a heritage which should at least bring credit, and not shame, upon our generation of architects. This refining influence of the beautiful in art was not a sentiment, but a fact. We were told that we learnt more from our failures than from our successes; certainly it was not an easy matter to be rid of them, for they were constantly staring us in the face. We might, indeed, learn much from the one or the other; but our duty was to learn, not to rest satisfied with successes or be discouraged by failures, but to aim higher and still higher, ever bearing in mind the permanency of our work and the effect, good or bad, it will have upon the minds and characters of those who are influenced by it.—A vote of thanks having been unanimously passed to Mr. King, the following elections were made: Mr. C. J. Tait, president; Mr. H. G. Luff (Devonport), vice-president; to fill vacancies on the council, Mr. B. P. Shires (Plymouth), Mr. James Jerman (Exeter), Mr. A. S. Parker (Plymouth), Mr. A. Thorne (Barnstaple); hon. treasurer, Mr. O. Ralling; hon. secretary, Mr. Harbottle Reed.

St. Mary Woolnoth Church, Lombard Street, which has been closed for more than three years in consequence of the construction of the Bank Station of the City and South London Railway, has now been re-opened. It was built by Hawksmoor (1666-1736), who was a pupil of Sir Christopher Wren.

New Patents.

These patents are open to opposition until July 2nd.

1899.—Incandescent Gas Burners.—9,380. G. H. FIRTH, F. H. BENTHAM and J. H. STOTT; all of Bradford. In order to secure the mantle from vibration, the cap and crutch which support it are separated from the body of the burner and rest on the top of a tube that fits over the Bunsen and is weighted at its lower end. Between the top of this tube and the burner is placed a conical spring.

Wood-working Machines.—10,917. C. W. FERGUSON, Glasgow. This machine combines a circular saw, a hand saw, a boring mill and a lathe. There is a table, supported by legs and struts, at one end of which is a band saw, and at the other a circular saw, both being driven from a fly-wheel in the centre. Hand or motive power can be used. When desired, the circular saw (which is only a small one for cross-cutting or ripping) can be removed and a boring bar or lathe chuck substituted. A lathe bed may also be attached.

Sewage Purification.—11,994. W. C. C. PAKES, London, W.C. By this invention the sewage is passed through a series of beds, alternately anaerobic and aerobic. The aerobic chambers may be in pairs, or larger groups, so that while the sewage is passing through one chamber of a group the others may be resting. The treatment by the anaerobic bacteria is not completed in the first chamber, but is resumed in the third, fifth, &c., chambers, after passing through the second, fourth, &c., chambers, in which the aerobic action goes on. It is claimed that a purer effluent is obtained by this system than by the usual method of completing the anaerobic treatment of the sewage before it passes to the aerobic bed.

Flooring Blocks.—12,332. C. SPIGHI, Florence, Italy. The characteristic feature of the blocks made according to this invention is that they have an upper part formed of wood and a lower part of asphalt, mastic, cement, plaster, or similar material, so that they can be laid like bricks with mortar or cement.

Tile-making Machines.—12,482. G. W. WINN, Wakefield. In machines of this class it has hitherto been customary to cut off "bats" or lengths of clay either by a hand cutter or by knives mounted on a drum. According to this invention the cutting wheels are carried by an endless chain driven by contact with the moving clay. The cut is made perfectly at right angles and is clean, besides which the action is rapid.

Hinges.—13,110. J. PRIEST, Old Hill, Staffs. This invention relates to that class of hinges for doors and gates which have a metal strap at the top and bottom working on pins. The hinge pin has a shoulder at each end, and the strap is fastened around the portion between, the pin itself working within a bracket that is fixed to the gate post. By this means the strap is prevented from moving down the pin and riding on the bottom socket.

Lifting Jacks.—15,814. A. L. MARCOTTE and M. A. LEGROS; both of Les Iris, France. The device combines two internally and oppositely screwed tubes in which works a rod, also screwed. The upper tube is applied below the object to be lifted, and the lower one has a foot for supporting the jack. Working on the rod, between the tubes, is a ratchet and lever, by turning which the lift is effected. In order to lower the object a second pawl is brought into play.

1900.—Travelling Scaffolds.—1,223. E. J. and E. T. PALMER, London, S.E. This self-contained travelling scaffold consists essentially of a wheeled base supporting vertical ladders that constitute standards, being strutted and braced by adjustable wire stays. A working platform is carried by the wrungs of the ladders so as to be capable of adjustment at any desired height on the standards. The scaffold runs on rails, and is specially adapted for indoor use. When not required it can be taken to pieces and packed within a small compass.

The following specifications were published on Saturday last, and are open to opposition until July 9th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—9,334, REEVE, appliances for holding doors in open positions. 9,337, MERCER, paint removers. 9,338, MERCER, distemper compositions and paints. 9,541, SMITH, machines for curling and wiring the edges of sheet metal. 9,543, REINCKE, machines for the manufacture of artificial stone. 10,108, POINTON, manufacture of gas for heating purposes. 10,970, REDMAN, apparatus for applying paint or other composition to surfaces. 10,983, STEWART-WALLACE, COWELL, PAISLEY, KEMP-WELCH, manufacture of gas for motive, heating and lighting purposes. 11,142, ALEXANDER and HOLDING, mould for brick-making and similar purposes. 11,536, McLEAN, manufacture of artificial stone. 11,960, VERWER, acetylene lamps. 11,984, SMITH, poles for supporting overhead wires in electric tramways. 11,995, PARE, apparatus for the treatment of sewage or other liquids. 12,935, MATHEWSON, reversing motions for planing, shaping and other machines. 13,351, VAN KANDEL REVOLVING DOOR CO., LTD. (*Van Kannel*), revolving doors. 13,595, BOOTH, construction of drying rooms or chambers especially suitable for treating cement, slurry, &c. 13,634, GAUFROY, drawing pen. 13,684, GRAY, fanlight, skylight and casement openers. 13,835, O'BRIEN (*Martin*), illuminated fountains. 13,933, DAY, bond for tramway and railway rails. 14,205, GRUNDON and GREGG, flap inlet boxes for letters. 14,506, PRUCE, panic bolts. 16,653, CROSS and BEVAN, manufacture of refractory materials for building and other purposes. 18,809, SCHWARZ, process of preparing the raw materials for the manufacture of calcareous sandstone. 21,946, CHEESE, glass tiles and their manufacture. 24,227, LAKE (*Huestis*), treads for stairs and pavements.

1900.—1,290, IZAMBARD, reproduction of writing, printing or drawing by the Röntgen rays. 2,125, CROWSON, sliding or extending ladders. 2,775, BOND, door checks. 4,167, SCHMERTZ, door locks. 4,457, SCHADF, electrically-controlled door locks. 4,554, BARNARD, wood-working machinery. 4,737, BOULT (*Dickinson*), chimneys and ventilating shafts. 5,000, WILLMORE, prismatic lights for pavements, roofs, &c. 5,020, NEWTON (*New Jersey Wire-Cloth Co.*), fireproof floors and ceilings. 5,021, NEWTON (*New Jersey Wire-Cloth Co.*), fireproof floors and ceilings. 5,022, NEWTON (*New Jersey Wire-Cloth Co.*), fireproof floors and ceilings. 5,023, NEWTON (*New Jersey Wire-Cloth Co.*), fireproof floors and ceilings. 5,177, DAY (*White*), metal joint. 5,284, HAUSLICH, deep-well pumps. 5,555, THOMSON or PURVES and PURVES, attachment of window blinds to their rollers. 5,580, THORNE, device for cleaning windows. 5,821, DE LÉRY and RICHARDSON, incandescent mantles and methods of making them. 5,829, DE NAEYER, process of making artificial stone. 5,848, SMITH, conduits and conduction supports for electric tramways. 5,893, LAKE (*American Wood Fireproofing Co., Ltd.*), fireproofing and preserving of combustible substances. 5,894, CARNEY and GORTON, riveting machines. 5,906, EVANS (*Noel*), door-closing devices. 5,994, GOLBY (*Hepburn*), waterproofing process. 6,023, BRITISH ELECTRIC WORKS CO., LTD. and BRANDER, electric bells. 6,063, METZGER, pumps. 6,098, ADAMS, lavatory basins. 6,146, FLORENCE, grates for fireplaces, stoves and ranges. 6,213, GOLBY (*Müller*), incandescent gas burners. 6,222, EDWARDS (*Pedrick and Ayer Co.*), pneumatic hoisting apparatus. 6,336, WEBER and MÜLLER, combination tool machine for working in metal.

Improvement of St. John de Sepulchre, Norwich.—It is proposed to repair the tower of this church by taking down and rebuilding the parapet and part of the buttresses, to re-hang the bells, lay down a new floor for the ringers, erect pinnacles, and put in rafters for the support of the flagstaff. The cost is estimated at £500.

Keystones.

A Memorial Window in Attercliffe Church, Sheffield, has been erected by Messrs. Jeffery and Foster, of Sheffield.

A new Recreation Ground at Aldington, Sussex, was opened last week by the Mayoress of Hove (Mrs. J. Colman).

For the Proposed new School at Ramsey, Essex, Mr. J. W. Start, of 54, New Broad Street, E.C., has been appointed architect.

Public Baths at Winchester are to be erected by the local corporation according to the designs of Messrs. Lansdell and Harrison, of 38, Bow Lane, E.C.

New Baptist Chapel at Ferme Park, N.—Mr. George Baines, F.R.I.B.A., and Mr. Reginald P. Baines, of 5, Clement's Inn, Strand, are the architects for this building.

Mr. J. Eadie Reid, who was at one time a pupil of Sir W. B. Richmond, has finished one of the frescoes that he is painting in the church of St. Columba, Southwick, Sunderland.

A new Chapel at Tonbridge School is being built at an estimated cost of £23,000. Accommodation will be provided for 650 worshippers. Mr. W. Campbell Jones is the architect.

A Board School at Lofthouse Gate, near Wakefield, is being built from designs by Mr. W. Watson, architect, of Wakefield. The mixed school will accommodate 300 children, and the infants' department 160.

New Mission Church for Leeds.—A new mission church in connection with Burley Parish Church is about to be erected. The building is to be of brick with dressings of red Runcorn stone. Mr. Percy Robinson, of Leeds, is the architect.

The Church of St. Mary the Virgin, Eccleston, has been consecrated on Thursday last. It has been built at the expense of the late Duke of Westminster, the cost being between £30,000 and £40,000. Mr. G. F. Bodley, A.R.A., was the architect.

New Band Stands at Birmingham.—Two new band stands at Birmingham were opened last week—one in the Queen's Park, Harborne, and the other in Highgate Park. The latter was erected from the designs of Mr. Job Cox, superintendent engineer of the Baths and Parks Department, the ironwork being supplied by Messrs. Hart, Peard and Co.

A Byron Memorial.—The site of the house where Lord Byron was born in 1788—No. 24, Holles Street, now swallowed up by the premises of Messrs. Lewis—has been marked by a handsome bronze bust set in a suitable architectural framework. The memorial is high up on the second storey of the building, but it is large enough to be well seen. It was designed by Mr. Taylerson after the picture at Newstead Abbey.

Passmore Edwards' Hall.—The foundation stone of this building will be laid by the Bishop of London during the last week in June. The site is close to the proposed new street between Holborn and the Strand, and the building will furnish a home in connection with the University of London for the School of Economy. It will be established at a cost of £30,000, towards which amount Mr. Passmore Edwards has contributed £10,000.

New Government Offices, Barrow.—It is expected that the new Government offices which are to be built on the High Level Bridge, Barrow, will take twelve months to complete. The offices comprise County Court Office, Board of Trade Office, Custom House, and Inland Revenue Offices. The building will immediately adjoin the Burlington Hotel, and, occupying about 53ft frontage and 50ft. from front to back, will be constructed of local bricks and St. Bees stone. Mr. J. H. Neal has secured the whole of the contract, and he has let the joinery work to Messrs. Gradwell, the stonework to Mr. Fairbairn, and the plumbing and painting to Mr. Morris.

New London Theatre.—Mr. Penley has had the old Novelty Theatre remodelled, and has reopened it under the name of the "Great Queen Street Theatre."

At Bow Brewery, E., a tank house is in course of erection from designs by Messrs. Foulsham and Herbert Riches, architects, of 3, Crooked Lane, King William Street, E.C.

A new Wesleyan Church at Willington Quay, Newcastle, has been built from designs by Messrs. T. A. Page and Son, of South Shields, the contractors being Messrs. Cowper and Henderson, of Jarrow.

New Municipal Buildings at Wallsend.—The Wallsend Urban District Council have decided to purchase an acre of land, in a field near the Coach and Horses Inn, for the erection of a block of municipal and other offices.

New Police Buildings at Hales Owen, Birmingham, have been erected in Stourbridge Road from the designs of the county surveyor (Mr. Rowe) by Messrs. J. H. Whitaker and Co., of Dudley, at a cost of £6,650.

The Registration of Architects' Bill, which was read for a first time on May 15th, will come up for its second reading in the House of Commons on June 13th. It is in charge of Mr. L. A. Atherley-Jones, Q.C., M.P. for North Durham.

"Modern Industry and the Village."—Messrs. Grayson and Ould, of Liverpool, and not Messrs. Douglas and Fordham, as stated, are the architects of the block of timber cottages shown on page 280 of last week's issue in connection with the article bearing the above title.

A new Lion House at the Dublin Zoo is to be built at a cost of £5,000. It is to be called "Lord Roberts' House," in order that in the gardens of the Royal Zoological Society there may be a permanent memorial of the period during which he has held the office of president of the society.

Hull Town Hall Competition.—It has been decided to ask Mr. Thomas Blashill, F.R.I.B.A., late superintending architect to the London County Council, to act as assessor in the competition for the extension of the Hull Town Hall, in connection with which premiums of £300, £200 and £100 are offered.

A new Mill for Pemberton, Wigan, called May Mill, is being erected from designs by Messrs. Stott and Sons, architects, of Manchester. The present old mill is 92ft. wide; the new one will be 102ft. wide. Mr. J. Partington, of Middleton Junction, is the builder, and Messrs. Dorman, Long and Co., of Middlesbrough, are supplying the rolled steelwork.

The British Pavilion at the Paris Exhibition was formally inaugurated on Thursday last. Mr. Edward Lutyens is the architect, and he has made the river front of the building a copy of Kingston House, Bradford-on-Avon. The total result is to give a very perfect imitation of a Jacobean house; the walls are covered with a grand selection of pictures by eighteenth century artists.

Tunbridge Castle and grounds, opened on Wednesday last to the public by Earl Stanhope, dates back to the days of Richard de Tonebridge, the uncle and devout follower of William the Conqueror. The ruins to be seen to-day represent merely the entrance gateway to the former fortress. Part of the outer walls remain, and the lower portion of the water tower. The mound of the keep, too, survives, and the entrance gateway, flanked by circular towers.

New Church for Roundhay, Leeds.—It is proposed to erect a new church at Roundhay, the estimated cost of which is £15,000. Mr. W. Carby Hall, architect, of Leeds, has prepared plans. It is intended to proceed at once with the erection of the parochial hall, the plans of which have been passed by the Plans Committee of Leeds Corporation, and it is expected that the building will be ready for use before the end of the year. In this, services will be conducted until the church, which will be known as St. Paul's, is built. The hall will accommodate 350 worshippers, and will cost about £3,000.

Musselburgh New Municipal Buildings.—It has been decided to invite competitive designs for the reconstruction of the town hall and municipal offices at Musselburgh at a cost of £5,000. The exterior of the old Tolbooth is not to be affected.

Honour for Mr. Thomas Drew.—The Lord Lieutenant of Ireland has intimated his intention to confer the honour of knighthood, with the approval of Her Majesty, upon Mr. Thomas Drew, R.H.A., F.R.I.B.A., President of the Royal Institute of the Architects of Ireland.

An Avenue of Statues.—A proposal has been made in Paris to erect an avenue, consisting of statues of distinguished living Frenchmen, from the Champs Elysées to the Invalides. The distance is considerable. One wonders, supposing they start at the Invalides, whether they will ever reach the Elysian Fields.

Art Exhibition in South-East London.—Sir L. Alma-Tadema opened the eleventh annual free loan exhibition of pictures for Southwark and Lambeth on Saturday last at the Borough Road Polytechnic Institute. The exhibition will remain open till June 17th, the hours on week-days being from twelve to ten, and on Sundays from three to ten.

St. Oswald's Church, Bradford.—This building, which is a chapel-of-ease to St. Stephen's, West Bowling, is being erected in the Late Decorated style at a cost of £10,000. Messrs. T. H. and F. Healey are the architects, and the following are the contractors:—Mason, T. Obank and Sons, Thackley; joiner, T. Taylor and Sons; slater, Hill and Nelson; plasterer, Cordingley and Sons; plumber, S. Rushworth, Shipley.

Royal Window removed from Christ's Hospital.—The great hall at Christ's Hospital is being gradually denuded of its ancient and modern glories in the shape of stained glass and armorial bearings. The chief portions of the window named the Royal window have just been removed, and will be placed in position in the new school buildings at Horsham, which will probably be opened in the autumn of next year.

Workmen's Compensation: Definition of an "Undertaker."—The ground of the recent appeal of John Garner in the arbitration from an award of his honour Judge Carter at the Liverpool County Court was that the claim had been made against him as the "undertaker," whereas his contract with the building owner did not constitute him one within the Act. The facts were as follows:—Messrs. Bowman, chemical manufacturers, desired to build new works adjoining their factory near Liverpool. They found all the materials and employed their own architect and foreman, under whose supervision the work was to be carried out. They required, however, labourers to do the brickwork, and they arranged with the present appellant to supply men for this purpose. The men supplied were paid for at so much per hour, the appellant's profit being the difference between the sum he received and the wages he paid away. When once the men were found his part of the contract was ended. One of the men so supplied was a man named Percival. He was working on a scaffold, which gave way, and he was killed. The man's widow and daughter sought compensation, and the county court judge made an award in their favour. The question for decision was whether the present appellant had rightly been held by the county court judge to be an undertaker, the appellant's contention being that he was merely himself a sub-contractor, and that Messrs. Bowman were the persons liable under the Act—Lord Justice A. L. Smith, in giving judgment, said the Act made the undertaker liable for any accident that befel the workman when engaged in work that came within the scope of its provisions. In the case of a building the undertaker was defined as the person undertaking its construction, repair, or demolition. It was clear that the present appellant was not employed in the construction of the new chemical works, and, whether Messrs. Bowman were liable or not as the undertakers, at any rate he was not. The appeal was therefore allowed.

LAST YEAR'S PATENTS.

THE seventeenth report of the Comptroller-General of Patents, Designs and Trade Marks, which has just been issued, supplies much interesting matter. Last year there were 25,786 applications for patents, 14,160 being sealed. The receipts from patent fees were £202,977, as compared with £200,418 in 1898, while the total receipts amounted to £225,700. The total expenditure only reached £123,216, so that the Patent Office made the handsome profit of £102,484 last year—a profit which might very well be largely reduced in favour of the inventors, by lowering the fees for obtaining a patent and the fees for maintaining it. And this magnificent profit was £19,886 less than it was in 1898. The applications from women inventors numbered 574, which works out at about 2.2 per cent. of the total number. From certain averages it appears that upon every 100 applications for patents, 50 have been sealed; and that out of every 100 patents sealed, 31 are kept in force for five years, 23 for six, 18 for seven, 15 for eight, 12 for nine, 11 for ten, 9 for eleven, 8 for twelve, 7 for thirteen, and 5 for fourteen. Putting this in another form, out of every 100 patents sealed, 69 expire after four years, 8 after five, 5 after six, and so on. The effect of the Workmen's Compensation Act is shown by the increase in the class "Wood," which is almost entirely due to inventions for guards to prevent accidents with working circular saws. (It may be mentioned, by-the-way, that the patenting of these guards is greatly overdone, as there are now hundreds of them.) To show how current events affect the Patent Office, it is interesting to note that after a fatal accident in Ireland to a passenger on an electric tramcar there were several applications for safety arrangements for such cars; but up to the present the war has not stimulated inventors. The following particulars will give an idea of the number of patents taken out in connection with building and allied work:—During 1898 there were 359 accepted complete specifications under the class "Buildings, &c." (this includes foundations, rooms, and a number of other details), 102 specifications for cements, 40 for chimneys, 144 for closets, 92 in connection with drains, 119 for filtering apparatus, 76 for fire-extinguishing apparatus, 129 for gas manufacture and distribution, 49 for glass, 72 for grinding and crushing appliances, 203 for heating apparatus, 128 for hinges, 189 for lifting appliances, 149 for nails and similar articles, 74 for paints, 131 for pumps, 35 in connection with roads, 47 for sewage apparatus, 16 for patent stone, 37 in connection with ventilation, and 138 in connection with wood. It is apparent on the face of it that the greater majority of these patents must be failures, or enjoy only a very short life, otherwise the market would be utterly overstocked—it is bad enough already. With regard to designs, the report states that 597 applications were made for the registration of designs for articles of glass, earthenware, porcelain, bricks, tiles and cement, and 142 for paper-hangings.

London Topographical Society.—The annual general meeting of this society was held on Monday evening last in the rooms of the Society of Antiquaries at Burlington House. The Right Hon. Lord Welby, G.C.B., vice-president, took the chair.

New Church for Upper Knowle, Bristol.—The new Church of St. Martin for the rapidly growing district of Upper Knowle, Bristol, is to be erected on the Wells Road in the Early English style. Pennant stone will be used, with Bath stone dressings, and accommodation will be provided in the completed building for 700 worshippers; but it is only proposed now to build the chancel, vestries and organ chamber, and two bays of the nave and aisles, to hold 400 persons. The cost of this will be £3,000. Mr. W. V. Gough, of Bristol, is the architect, and Mr. Maton Durnford, of Knowle, the builder.

New Companies.

Newport Ironmongery Company, Ltd.

This company was registered on May 15th with twenty members, each liable for £1, to carry on the business of furnishing and general ironmongers, ironfounders, &c. Registered office: 17, Commercial Road, Newport, Monmouthshire.

Keighley Stone-Sawing Company, Ltd.

This company was registered on May 17th with a capital of £4,000 in £1 shares to carry on the business of stone sawyers, cutters, and workers, quarry and mine owners, &c. The first directors (to number not less than three nor more than six) are E. Turner, E. Smith, J. Smith, S. Whitaker and W. Fowlds.

Brush Union, Limited.

This company was registered on May 10th with a capital of £12,000 in £1 shares to carry on the business of brush manufacturers, dealers, agents, and factors. The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers. Registered office: 1-2, Chiswell Street, E.C.

Henry Addison and Co., Limited.

This company was registered on May 18th with a capital of £10,000 in £1 shares (3,000 five per cent. preference) to acquire the business of Henry Addison and Co., and to carry on the business of church and school furniture manufacturers, cabinet manufacturers, joiners, ironfounders, builders, contractors, &c. Registered office: Waterloo Works, Wellington, Salop.

Clogwyn Slate Quarries, Limited.

This company was registered on May 18th with a capital of £10,000 in £1 shares to adopt an agreement with V. Groom, R. F. Miller and T. H. Willis, trading as the Clogwyn Slate Quarries, and to carry on the business of quarry and mine owners, slate, stone and mineral merchants, &c. The first directors (to number not less than three nor more than seven) are V. Groom, R. F. Miller, and T. H. Willis.

Ingram Houses, Limited.

This company was registered on May 11th with a capital of £55,000 in £1 shares to establish, maintain, control, and carry on residential clubs, residences, homes, and dwelling-houses, as brick, tile, and terra-cotta manufacturers, as timber merchants, joiners, saw millers, dealers in building materials of every description, &c. The first directors (of whom there shall be not less than three nor more than seven) are to be elected by the company.

Amerells and Feverills Brick and Traction Company, Limited.

This company was registered on May 9th with a capital of £500 in £1 shares to carry on the business of brick and tile makers, engineers, owners and operators of steam traction engines and rollers. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Registered office: Amerells and Feverills Estate Office, Little Clacton, Essex.

Harris and Sheldon, Limited.

This company was registered on May 17th with a capital of £75,000 in 7,500 £5 preference shares and 37,500 £1 ordinary shares to acquire the business of shop front builders, air-tight show-case makers, makers of all kinds of fittings, and as general brassfounders, &c., carried on by S. Harris and J. E. Sheldon at Stafford Street, Birmingham; 69, Wood Street, Cheapside, London, E.C.; Hilton, Manchester; and 71, Queen Street, Glasgow, and, generally, to carry on in all or any of their respective branches the businesses of builders, brassfounders, shopfitters, metal workers, &c. The first directors (of whom there shall be not less than three nor more than seven) are H. Rogers (chairman), J. E. Hoskins, S. Harris and J. E. Sheldon.

Forest of Dean Stone Firms, Limited.

This company was registered on May 9th with a capital of £60,000 in £1 shares to acquire the businesses now carried on by David and Sant, Limited, at Park End and elsewhere in the Forest of Dean, by the Wilderness Brick and Stone Company, Limited, at Mitcheldean, Gloucestershire, and by W. W. O. McGaul at Bridgend, Glamorganshire, with a view, generally, to carry on the businesses of quarry owners, stone merchants, brick and tile makers, lime burners, &c.

Tate and Oglesby, Limited.

This company was registered on May 15th with a capital of £10,000 in £1 shares to acquire the business carried on at Whitefriargate and Charlotte Street, Hull, by W. Tate and H. W. Tate as William Tate and Son and R. Oglesby and Son, and to carry on the business of china and glass salesmen, wood, stone, and metal workers, builders, joiners, timber merchants, carvers, ironmongers, furnishers, &c. The first directors (to number not less than three nor more than seven) are W. Tate, J. A. Adams and H. W. Tate.

Carlisle Varnish Company, Limited.

This company was registered on May 10th with a capital of £5,000 in £1 shares to acquire the business carried on by the late A. Thompson at Canal Bank, Carlisle, as the Carlisle Varnish Company, and to carry on the business of varnish manufacturers, oil and colour men, dealers in proprietary articles, &c. The first directors (to number not less than two nor more than seven) are R. Creighton, J. Reary, T. S. Strong, J. Watson, sen., and T. Williamson. Registered office: Devonshire Buildings, 24, Devonshire Street, Carlisle.

Bournemouth and District Property Company, Limited.

This company was registered on May 9th with a capital of £10,000 in £1 shares to acquire certain leasehold messuage and buildings at East Cliff, Bournemouth, known as Brunstath, and to carry on the businesses of landowners, builders, contractors, brick, timber and hardware merchants, &c. The number of directors is to be ten. The first are J. J. Allen, J. E. Beale, W. E. Bury, T. J. Hankinson, F. H. Hankinson, E. W. Jenkins, G. J. Lawson, G. A. Mate, S. J. Mate and W. T. Reynolds. Registered office: Richmond Chambers, The Square, Bournemouth.

H. H. Martyn and Co., Limited.

This company was registered on May 17th with a capital of £18,500 in £1 shares to acquire the sculpture studios, carving, masonry and monumental works at Sunning-end, High Street, Cheltenham, and the art joinery and cabinet works at Belle Vue, Cheltenham, with the business carried on as H. H. Martyn and Co., and to carry on the business of sculptors, art carvers, wood and metal workers, joiners, &c. The first directors (to number not less than two nor more than five) are H. H. Martyn, A. W. Martyn, and H. W. Dutton. Registered office: 59, High Street, Cheltenham.

Parsons Brothers, Limited.

This company was registered on May 4th with a capital of £110,000 in £10 shares to acquire and amalgamate the businesses of timber and slate merchants now being carried on at Eastbourne and Newhaven under the style or firm of Latter Parsons and Co. and as Parsons Bros. at Lewes, both in the county of Sussex, and, generally, to carry on in all or any of their respective branches the businesses of dealers in timber, manufacturers of and dealers in slate, cement, coal, coke, &c.; as timber growers, sawmill proprietors, and saw millers, brick, tile and terra-cotta manufacturers, as quarry owners and stone merchants, marble masons, &c. The first directors (of whom there shall be not less than three nor more than eight) are L. Parsons, J. Parsons, T. Parsons (life directors), E. D. C. Davey, W. J. Parsons, W. L. Mannington and S. Hume. Registered office: Eastgate, Lewes, Sussex.

In the Matter of Roads. **CRITICISM of County Councils has been a legitimate amusement**

ever since those authorities came into being, and has afforded plenty of occupation both for avowed enemies and pledged friends of this form of local government; but no matter in what other directions the Councils may have been adversely criticised, they have, in the matter of roads at least, amply justified their existence. The condition of our roads is of vital importance, not only to all those who use them for heavy traction, but to those who desire to travel quickly and easily from point to point; and finally is a matter of peculiar interest to those who are engaged in the development of suburban estates. Before the institution of County Councils, the control of the roads outside municipal boroughs was in a very unsatisfactory state. A General Highway Act had in the early thirties superseded such obsolescent specimens of early statute-law as the Statute of Philip and Mary, which provided for parish road-surveyors, and for men, horses, carts, and materials to be supplied, in lieu of rates, by the farmers and yeomen, at their orders; and "statute labour" after an existence of three hundred years thus disappeared. The General Highway Act allowed parishes to combine and form Highway Boards, just in the same manner as they formed Poor Law Boards. Levying a common rate, and choosing a surveyor, they set about mending their parish roads, leaving the old turnpike roads in the care of the Trusts which formed separate authorities having the main lines of communication between important towns in their charge, and deriving the funds for their proper maintenance from the tolls they were, by Acts of Parliament, authorised to collect. Turnpike roads were thus entirely independent of rate aid. They were roads of great excellence, both as regards gradient and surface, and they were, in fact, the only good roads in the country. Those roads which were in the hands of the individual parishes, or of the parishes allied as Highway Boards, were at the extremity of badness. Their surveyors were not always—nor often—competent men, and were in fact, elected by the Boards from a crowd of necessitous inhabitants whose only qualifications were that they were in want of employment, no matter of what kind. These "surveyors" in their turn were instructed to give work to the broken down old men who would otherwise have become inmates of the workhouse. In this way the parishes saved something on the Poor Rates, but it may readily be supposed that the roads were not greatly benefited by this kind of labour, and it is a matter for sur-

prise that more bad roads were not indicted, as they were liable to be, in common law. But just when turnpike roads were at their best, and "highways," *i.e.* the rate-repaired roads, at their worst, railways came, and, for a time, rendered the subject of secondary interest. It was only, indeed, when County Councils came into being that the Renaissance of rural roads dawned. Between the era when the Romans left Britain, and the present, the scientific construction of local roads was a lost art, however skilfully the main roads were engineered and metalled by Telford and Macadam. Some of the old travellers' tales of the roads are, indeed, almost incredible, and had another than that careful and conscientious observer, Arthur Young, described the roads existing in his time in such terms as he uses, we might not un-

completed than rents rose from 7s. to 11s. per acre."

Here, then, we perceive an instance of virtue bringing a reward in cash, as well as the less tangible satisfaction which is supposed to come from the commission of good deeds. Here, at least, we perceive good roads to be justified to the present generation.

C. G. H.

A Drawing by Pugin.

THE illustration on this page is reproduced from one of the original drawings made by Welby Pugin for his "Treatise on Chancel Screens." In many cases Pugin actually etched the plates which serve as illustrations to his works, but in this instance

SCREEN AT ST. ELIZABETH'S CHURCH AT MARBURG. FACSIMILE OF A SKETCH BY WELBY PUGIN.

reasonably be excused from believing him. But Young is an unquestioned authority, therefore, when he tells us of the condition of the road to Horsham from London just previous to the existing road being constructed in 1756, and of the route which travellers were obliged to take, we do well to be astonished.

"It was," he says, "so execrably bad that whoever went on wheels were forced to go round by Canterbury, which is one of the most extraordinary circumstances that the history of non-communication in this kingdom can furnish.

"The making of the road was opposed," he adds (and this is a touch which has not lost its air of modernity), "for what measure of common sense could ever be started that would not be opposed? It was no sooner

the published illustrations were clearly worked up by some intervening hand, and, though they have a more finished appearance than the original sketches, have undoubtedly suffered artistically in the process of transformation. The illustration, it will be noticed, is a very fine pen drawing, almost microscopically fine; yet, none the less, it is bold and firm, suggesting often by the merest scratch a richness of ornament which the transcriber has had much ado to render in the finished illustration by a much greater profusion of line. The minuteness of the execution is partly explained by the fact that in all such work Pugin used a lens like a watchmaker's glass, held in the eye.

On Story in Stone.

I WOULD like to discover a fulcrum whereon one might move the architectural mind on the subject of storiation. By the architectural mind I mean, firstly, the client who commissions; and, secondly, the architect who devises. Would that we could stir up, in the ordinary British mind, a desire for (and a willingness to pay for) somewhat more of story, or meaning, in the decorative carving, mosaic, moulded work, or painting applied to the office and shop fronts that we see as we pass along the streets of our cities. It need not cost more than the unmeaning but elaborate foliage and curly mouldings that so often break the repose of a street front, and testify to poverty of thought; but committees and individuals are alike timid and nervous about what the well-known old lady will say, and collectively or singly they prefer the path of safe incoherency or stupidity. However, the success (and there is nothing that succeeds so well as success) of such interesting experiments, as the sculpture by Mr. Thornycroft in the City, or the terra-cotta frieze by Mr. Creswick over the hat shop at the West End, should stimulate others to ask of their architects that spaces should be provided for such storiation in all new buildings. Architects also might use fewer panels of mere ornament, and in their stead, make provision for decorative work which, in addition to giving variety and making bands, and masses, of light and shade or "texture," shall arrest the attention of the man in the street and give him something to think about. The trade or business carried on in the building—some contemporary event, *e.g.*, a jubilee of any kind, a little bit of national or local history, the preservation of some antiquarian record, even an accident occurring during the execution of the works, *e.g.*, the "Dig awa' boys, I'm no dead yet" at Edinburgh, each of these is worthy of commemoration in some way or other, and all would tell their story to those who come after. Mosaic might be much more frequently introduced in the panels and friezes now left in decorous but uninteresting plainness. It has one advantage over sculpture—that it gives colour; and the splendour of gold grounds would light up the dinginess on the south side of many of our east to west thoroughfares. It is also more independent of bright light and serene hours than relief work; and would be therefore more useful in the gloomy corners. But—colour and relief, mosaic and sculpture—both are necessary; and both will be felt to be valuable adjuncts in our exterior architecture.

I would plead, then, for more storiation; that its educational function may be appreciated by the client; and its artistic value be felt by the architect. And let it not be said that it is impossible or difficult to arrange and execute schemes of storiation which shall be suitable, or at least not incongruous on all kinds of buildings; for when the scheme is arranged, *i.e.*, the subjects for illustration are set down in connected order, then there are mosaic workers, like Spence, and relief workers in numbers, like Roscoe Mullins, who could execute all that might be demanded from them to make our highways beautiful with colour.

H. H. S.

On Reflection.

A Squabble about Prices.

MR. GEORGE E. WRAGGE, Hon. Sec., the London Association of Lime, Cement and Brick Merchants, sends us, at the request of his Committee, copies of letters which have passed between himself and the editor of our contemporary, "The Builder," and asks us to publish this correspondence. We have not space to print it *in extenso*, but the controversy is as follows: Mr. Wragge in his private capacity first wrote to "The Building News," pointing out that "The Builder" was giving prices for materials such as bricks, remarking that the price given for stocks was 36s. 6d. per 1,000 alongside in the river, and for Flettons at London Railway Depots, 31s. 6d., which prices he referred to as "simply absurd." Then in his official capacity, at the request of his Committee, Mr. Wragge wrote to the editor of "The Builder," regretting the prices of Portland cement and lime published in that journal were incorrect, "being, in fact, the actual minimum prices operating at the present time." The editor, in answer, said he could do nothing in the matter until he had consulted his contributor who compiled the price lists; and then Mr. Wragge wrote that he could not agree that nothing could be done in the matter, and asked for his letter to be inserted in the next issue, as the information given was incorrect. The editor of "The Builder" replied that three firms in London had supplied him with prices, and said that if Mr. Wragge's association wanted to put up the prices, it was no concern of his, as the paper was not conducted in the interests of the Association. He also referred to the letter in "The Building News" as a gratuitous attack, in view of which Mr. Wragge had forfeited the right to expect the use of "The Builder's" columns. The closing letter is from Mr. Wragge denying any intention of the Association to put up prices, and pointing out that the letter to "The Building News" was in his private capacity, and referred only to the price of bricks. Now we have no axe to grind in this matter, and we are not concerned with the controversy between Mr. Wragge and our contemporary, except in so far as it affects the general subject of builders' prices, on which we may be able to throw a little light. We cannot agree that the prices given by "The Builder" were absurd or the minimum, as we have knowledge of these materials having been bought, in large quantities, at slightly lower prices than those given. But surely there is no need for all this fuss to be made over the prices given by our contemporary, for its prices are—by their very nature—most unreliable and can be of use to neither the merchants nor the buyers.

Conditions Governing Prices.

It will be noticed that we do not in this Journal give prices for any other materials than those sold in the open market. Before we started our list of "Current Prices" some time ago we carefully considered the whole matter and came to the conclusion that we would give only the prices actually realised in open market, which are open to everyone to buy at if he attends the sales, and, therefore, form an exact scale to show how the prices are rising and falling; more than this, they cannot do. Even this limited value would be wanting in the case of average prices for other average materials not in open market, as no standard would be fixed for gauging the fluctuation. For the prices to be of any value the maker's name must be given, and

although we are in a position to give this information, we refuse to advertise any particular firms and thus upset the relations of trade. The prices now depend upon so many things—the quality, the standing of the merchant, the distance from place of manufacture, the financial standing of the buyer, and the quantity bought—that no one about to purchase any considerable quantity would think of doing so without getting definite quotations. As an instance of the differences that may arise, one large purchaser of sound financial standing with whom we are acquainted was obtaining only last week Portland cement alongside in barges just below London Bridge at 29s. 6d. per ton, whereas another purchaser had three quotations for 30s., one from the very firm who was supplying at 29s. 6d., and a small builder was being quoted 32s. 6d. per ton. With regard to timber, we give only actual results of sales in open market for those kinds which are largely and generally used and being sold almost every week. To give the price of Greenheart, Sequoia, Lancewood, &c., seems to us waste of space, when only twenty or thirty logs sometimes are sold in two or three months; and to dilate upon the wood of various sizes and qualities and of many different ports of export is just as useless, for every buyer of timber knows that the lower qualities of timber from one exporter are equal to the higher of other exporters, and therefore announcements of results of sales cannot be relied upon unless the timber is of standard quality, or has been seen at the sale. The same might almost be said with regard to varnishes.

Fire and the National Gallery.

THOUGH the danger to the National Gallery was grossly exaggerated, the fire which broke out in the adjacent property last week served as an unpleasant reminder of the standing menace to which our art collection is subjected. At no time during the outbreak was the Gallery likely to catch fire; but in another conflagration the wind might not be so propitious, or the officials so prompt in getting the flames under, and we should have the mortification of seeing our priceless property reduced to ashes. Therefore it is necessary that the building should be properly isolated without further delay. This can only be effected by cutting a broad road through on the west side of the Gallery from Pall Mall to Green Street. As a street it is unnecessary, but as a means of ensuring the safety of the National and Portrait galleries it is imperative. Successive Governments have deferred the matter on the ground of economy, and economy which is likely to cost us dear, seeing that we shall now have to acquire the new block of public house and hotel property at the corner of Green Street and Charing Cross Road. There must be no mincing matters, the thing must be done and done effectually. One of our contemporaries suggests that the L.C.C. should take up the matter, but in this we do not agree. The collections belong to the nation, and money spent in safeguarding them must be provided by the nation. Besides the L.C.C. have in hand the new street improvement, which will tax all their resources for some time to come, and London is impatient to see this work completed. If the Government purchase the adjoining properties, and, from motives of economy, turn the sites into the barrack ground, no one will complain, for an open barrack ground will be as safe, if not safer, than a public street; and there is nothing beautiful about the rear building of the galleries that requires a street to set them off. But the safety of our national collection is of primary importance, and must be no longer delayed.

FIG. 1.

GESO.

ITS USE IN DECORATIVE PAINTING.

By F. HAMILTON JACKSON.

THE word "gesso" is an Italian word, signifying gypsum—plaster of Paris; so that if you speak to an Italian of work in "gesso" he understands you to refer to what we are accustomed to call plaster casts. But the word has been used also to express a mixture, of which there are many forms, the basis of which is whiting mixed with glue or size, and generally applied to the surfaces to be decorated with a brush while in a wet state, though this treatment may be varied in several ways without impairing the permanence of the work or altering its effect to any great extent. It is a form of art peculiarly suited to the painter's use, and one by means of which decorative effects of the richest, as well as of the most delicate, quality may be obtained with comparative ease.

It is, though closely allied thereto, a quite different form of art from stucco duro, with which it is often confused, this being distinctly a sculptor's medium, and lending itself much more readily to modelling and carving than "gesso" does. Stucco duro was the material in which many devotional bas-reliefs of the Renaissance were executed, shop replicas of marble originals, the productions of the ecclesiastical furnishers of the time, which were painted and finished with added ornaments of true "gesso," coloured and gilded very often by way of enrichment. Examples of this sort of work are to be seen at South Kensington, and there was a very fine collection of them in a winter exhibition at the Royal Academy some few years ago.

The use of "gesso" or some similar material is of the highest antiquity. The Egyptians of the Fourth Dynasty, in making those effigies of their departed friends which startle us even now with their extraordinary lifelikeness, first roughly shaped the figure in wood, then covered it with fine linen, like a skin, and upon this spread a thin layer of plaster, by means of which refinements of modelling were easily added, colour being subsequently applied to ensure a still greater resemblance to life—their object being to exactly simulate the person of the deceased. This process is much the same as that employed in Italian work of the Middle Age and Renaissance periods, and indeed in much of the "gesso" produced to this day. The Egyptians also employed the same material a good deal in decorating furniture, generally of the cheaper sorts, making use of painting and gilding over it in place of the inlays of precious stones and ivory and golden ornaments used in their more sumptuous cabinet work.

In Roman times, a material seems to have been preferred more resembling marble, and carved like it, and stucco duro was employed for small architectonic decorations.

The materials with which this was made

were well-burned and slacked lime, a little fine sand, and finely-ground limestone or white marble dust. The whole was well tempered together with water, and beaten up with sticks till compounded into a good workable paste, and when properly worked was susceptible of such surface finish that, after being polished with chalk and powdered lime, it was sometimes used for mirrors, Vitruvius tells us!

Ornamental designs were rather carved than modelled in it—a process of subtraction—which produces quite a different effect from that of addition, as in "gesso" work, and the same process was used by the various "stuccatori," whose work adds so much charm to the earlier Renaissance buildings in Italy. Jewellers, too, made use of it for models, in place of wax, as being more permanent, and, on the other hand, it was used for large work, such as Henry the Eighth's vanished palace of Nonesuch, which was no doubt the parent of the pargetry still to be seen on the fronts of a few old houses in the provinces.

If one visits the National Gallery and enters the rooms devoted to early pictures of the Italian and German schools, the first thing to strike the eye is the very different standpoint from which craftsmen of those days looked at their art productions from that usual to artists of the present day. Their first object seems to have been the decorative effect of the whole, and for the purpose of gaining richness and splendour of colour and surface they resorted to the lavish use of gilding, probably moved thereto by the fact that goldsmithery and painting were then closely allied crafts, and by the recollection of lovely Byzantine enamels, then more common than they are now, alas! The accurate representation of Nature, the effects of aerial perspective, appear to have been quite a minor consideration, instead of being, as now seems to be the case generally, the be-all and end-all of artistic effort. Looking more closely one sees that the golden surface is broken up in various ways—a depressed diaper appears in some places, in others rays seem to be cut out of the surface, and in others, again, ornaments appear raised above it. Indeed, in some of the later pictures of the period details are made to project with the projection of Nature—for instance, in the great altar piece by Crivelli, in which jewels and crowns stand out half an inch or so; and St. Peter's keys are suspended by a piece of actual cord dipped in "gesso" and gilded, behind which one can pass a finger. The earliest of these pictures is one by Margaritone of Arezzo, painted in the middle of the thirteenth century. The latest is by Fungai, the Sienese, who died in 1516. The Sienese always loved decoration, and this belated decorator died only four years before Raphael's death, which shows with what extraordinary rapidity art advanced at that period; for it is plain that the use of "gesso" and gilding was abandoned because the artists thought that they could imitate everything in paint; and were, in fact, proud of their achievements, as they well might be. In proof of this pictures by Mantegna may be cited, such as the lovely

triptych in the Uffizi and the Gonzaga portrait, in which a great deal of actual gold is used, as it is, too, in his chiaroscuro paintings very often, while there are also pictures of his to be seen in which he has painted the effect of gold in the draperies. Crivelli, too, while in some works he uses "gesso" and gilding lavishly, side by side in the same work uses gold in flat patches for patterns, and hatchings of gold on the lights of the draperies, and paints the relief of some of the same ornaments which he has raised with "gesso" in another part of the picture. The direction of their aim changed, it was no longer the production of a beautiful piece of decoration which was uppermost in their minds, but the contest with the difficulties of the representation of Nature in the chosen medium, a contest in which the manual dexterity of the workman became so tremendously developed that in the next generation or two it served in place of mental excellence and sentiment, till in the marvellous achievements of Luca Giordano a point is reached which may be usefully considered as a warning to modern artists of the Nemesis which certainly overtakes exclusive attention to triumphs of manipulation.

The decorative effect of "gesso" and gilding appears to have been particularly to the taste of the Tuscans, most of the pictures referred to being the work of either Florentine or Sienese artists, though a few are the productions of the Venetian and allied schools, and the early Perugian artists also made use of the process for pictorial purposes. There are two or three altar pieces of which mention may be made, which appear to be in their original frames, and show how useful the "gesso" was in making picture and frame one whole, which in decorative work is a matter of the first importance. One by Spinello Aretino is by the left hand entrance, the architectural portions of the frame of which are enriched with stucco patterns, capitals, corbels, &c., all worked with "gesso" upon a core, probably of wood, and the softness of the angles, especially in the canopy, assists the decorative effect of the painting very much. In the painting itself is no relief work—only engraved and punched patterns. In one of the cross rooms is another by Jacopo Landini, the frame of which is very like one surrounding a picture of Giotto's in the Uffizi, and here, too, the scroll patterns are very good, and assist the decorative effect of the whole work very much. The extreme value of the softened edges of the mouldings may here be noted, in contra-distinction to modern decorative work of the same kind, in which sharp edges seem to be sought, giving a littleness and pettiness to the whole effect, with their fidgety lines and sparkles of light (when gilded), most damaging to the impressiveness of the painting, instead of assisting it as the old frames do. There is also an unnamed fifteenth century Florentine Madonna, a "tondo," with an elaborate frame worked on the panel with "gesso"—two much ornamented circles, one within the other, separated by cable mouldings and with a background spotted all over with raised spots, which is a

very decorative work and quite different in treatment. In the German pictures graving was soon abandoned, and lines painted over a gold ground were used instead.

All these early pictures were painted in *tempera*, that is to say the colours, in the form of powder, were mixed with a medium such as size, or egg diluted with white wine. This mode of painting was universal before the use of oil with the colours became general both on cloth and panel, and some authorities maintain that large works were executed on canvas in *tempera* as late as Carpaccio's time, whose pictures illustrating the story of St. Ursula, in the Academy of Venice, were held to be so painted by Signor Botti, who was the director of the academy some twenty years ago. But most of such works were painted on panels, and these panels were prepared with "gesso" in the following manner, as Theophilus tells us:—"Take gypsum, burnt like lime, or chalk with which skins are whitened, and carefully grind it with water upon a stone, then place it in a baked earthen vessel, and pouring in some glue made from skins, place it over the coals, that the glue may liquify, and in this manner paint over the skin (or canvas) very thinly with a pencil (this skin or canvas has first been glued to the panel). When it is dry paint somewhat thicker, and, if needed, paint a third time (the passes of the brush being made in different directions). When it is quite dry, take the herb called shave grass, which grows like a bulrush and is ragged; when you have gathered it in summer you will dry it in the sun, and will rub this whitening with it until it is made everywhere smooth and polished."

The patterns appear to have been mainly produced with punches, something in the way in which a skilful bookbinder will build up an elaborate design for a cover with three or four tools used in different combinations, and with the addition of lines.

It is better, however, though vastly more wearisome, to grave the pattern out of the "gesso" surface, but better still to have it raised instead of sunk. There are many

beautiful screens to be seen in the eastern counties, in those churches which were built in the late fourteenth and fifteenth centuries under French and Flemish influence, and in these screens are panels painted with figures, with diapers and borders upon their robes and with ornamented backgrounds which are enriched with raised ornaments in "gesso;" in fact one finds it to have been in use almost everywhere for the purpose of enriching the effect of smallish works of art.

In addition to its use for pictorial purposes it was largely employed in the decoration of articles of furniture and equipment. Examples of such objects are to be seen in the Museum at South Kensington, such as marriage coffers and boxes, picture frames, &c., and Theophilus gives us an interesting list of such things with the way of preparing them. "Saddles and octofori, that is, folding chairs, footstools, litters, and other things which are sculptured and cannot be covered with leather or canvas, you will polish with the grass as soon as you have scraped them with an iron, and in this state will whiten them over twice; and when they are dry will smooth them again with the grass. After this measure them with the compass and rule, and dispose your work, that is, figures or animals, birds and foliage, or whatever you may wish to portray. Which done, if you wish to ornament your work, lay on gold leaf," &c., and one may remark that the gilding is to be done with white of egg, which bookbinders do still, and that sometimes three leaves of gold are to be laid one on top of another!

The composition ornament used nowadays by frame-makers is a base descendant of the mediæval "gesso," and shows how a good material may be degraded by being put to a false use. The object of this ornament being to simulate carved work, to give at small cost the appearance of that which would be necessarily expensive if properly done, it has become contemptible in the eyes of all men of clear perceptions.

The use of true "gesso" has been revived of late years, more perhaps in the direction of

FIG. 3.

relief than of painting, and while in the hands of those who understand it beautiful results have been obtained—works may be instanced by Mr. Walter Crane, and Mr. Aldam Heaton showed some at the Paris Exhibition of 1878, which attracted a great deal of attention, while in the direction of relief work nothing can be more charming than the arabesques modelled by Mr. Stephen Webb—yet the greater part of the work done has failed, because too great relief has been attempted. One reads in the instruction books directions for preparing heads and other prominent parts with tow and rough "gesso," finishing with finer coats. It is much simpler to use a very flat relief which gives no opportunity for cracking off, and by finishing with transparent colour a quite startling appearance of projection may be obtained. The curtain in the accompanying illustrations (Figs. 4 and 5) was so slightly raised as to be only just perceptible to the finger passed over it, and in the figures of angels from the same reredos (Figs. 2 and 3) the relief was nowhere more than a sixteenth of an inch.

There are many different recipes for the production of the medium with which the whitening is mixed to be found in books of workshop receipts, but it is of little use to quote what might prove misleading. "Gesso" is not a thing which can be bought at the artists' colourman's shop ready put up in tubes, and laid on with any certainty of the result being satisfactory. Whatever mixture be used the worker must be prepared for many failures before success is attained, and much loss of temper, for the material is always providing surprises for the unfortunate experimentalist. Perhaps the panel may have just received the final touches and been put aside to dry, and there comes an ominous crack, and half of the work scales off! Perhaps it may crack deeply down one side, while the other remains quite right (and that entails cutting it out right down to the ground), or it may remain wet the whole day, when it is of the greatest importance that it should dry quickly; when one counts on it doing the same thing the next day and so arranging one's work as to take advantage of the probability, it may dry in an hour! Or, if it dry properly, one part may be yellow and another white, one part rough and mealy on the surface, another horny and shiny, and these variations occur when the same medium has been used from the beginning to the end. In fact, the uncertainty is so great that one well-known decorator abandoned the use of it some years ago, because after five successes came a failure, and he could not find out the reason. He was not the actual workman himself, and that, perhaps, explains his failure to do so, for success lies in knowing the medium thoroughly and its behaviour under all circumstances. The "gesso" worker's life is not altogether a happy life; for the earlier stages of the work are best accomplished with the panel in a horizontal position, and he

FIG. 2.

needs "a cast-iron back with a hinge in it," almost as much as Charles Dudley Warner's gardener; for, if the panels are large, they must be either on the floor or on a low table that he may reach all over them. And if it turn out to be necessary to rub the surface down and engrave a pattern, his throat becomes as dry as a lime-kiln, and his clothes resemble a miller's. Again, if the work is to be done on a ceiling, he endures the tortures which Michael Angelo sets forth in his sonnet on his sufferings while painting the roof of the Sistine Chapel.

The mode of work made use of in the production of the things illustrated was as follows: First a sketch was made settling the

FIG. 4.

main lines of composition and giving some idea of the proportions of bossed and plain or engraved surface—such a sketch as Fig. 6, which was made for a drum-shaped ceiling—then a cartoon was drawn, on which all important details were settled, such as folds of draperies, silhouettes of limbs and heads, main branches of trees, &c. This cartoon is useful also to make sure of the drawing of features and expressions, though the modelling of flesh surfaces is left to be expressed by painting, only a slight raising without detail being given in the "gesso." Fig. 1 gives the effect of a panel for a music room when nearly complete, worked in this manner.

Then the panels were prepared. Those for the reredos, of which fragments are given,

were of oak which had been in the church for eleven years, the panel for the music-room was of mahogany, while the ceiling was fibrous plaster. This preparation was the same as that described by Theophilus, already quoted, except that glass-paper was used instead of shave grass. The next process was to trace in carefully from the cartoons the larger masses of the design, and "float" them in with "gesso." When dry the smaller details were traced and raised, and finally the surface brought to the required condition. The greater part of the work was done with the brush, but sand-paper was a very useful assistant in getting smoothness over large surfaces, and occasional resort was had to the knife to sharpen edges and grave a pattern. Next, the whole surface was covered with aluminium leaf. The advantage of this is that colours that cannot be got transparently over gold because of its yellow colour, such as sea greens and purples, are obtainable easily over a white metal. Silver tarnishes and turns black easily, which makes it less suitable than aluminium, though it is the metal which was employed by the mediæval decorators. And, finally, the painting was done with a combination of transparent, semi-opaque, and solid colouring. The surface was first tinted and the lights wiped out, a process which the raised preparation underneath made quite easy, and then the shadows were painted with strong colour. The metal showing through nearly everywhere enables one to work with pure colour to a degree incredible to the easel picture painter. One of the angels shown in Fig. 2 had robes, the shadows of which were painted with vermillion and rose-madder—and something of the splendour of effect of ancient mosaics and enamels is within reach of the worker in this process; by means of it, too, intelligibility may be attained at an enormous distance. Figs. 2 to 5 are portions of a reredos with figures about 3ft. high, and from a distance of 150 feet and more the composition could be made out in a church not over well lighted. This is a result which the writer believes is not to be obtained by any other process. It is also suitable for work near the eye, and small work; the original of Fig. 7 (see inset sheet) is but 1ft. by 8in.

On the question of permanence: If the back of the panel, of whatever material, be coated with some preparation to resist damp, the face is well protected by, first, the gold size which holds the aluminium; second, the medium in which the colours are ground, or which may be mixed with them during the process of application; third, the medium with which the painting is finished—either a varnish if the surface is desired to be shiny, or a wax medium if dull. So that one may leave damp out of consideration; and if the relief is kept as slight as has been suggested, there is small likelihood of any accident, for the adhesive power of the medium is so great that it is very difficult to detach it even from a shiny, non-absorbent surface, such as glass or polished wood.

The mediæval "gessos" are, many of them, in a tolerable state of preservation, though they have been subjected to centuries of neglect, and the materials which we have now ready to our hands are at least as good as any which were to be obtained in those times.

In the course of the last few years examples of coloured sculpture have been shown in various exhibitions, and it has been used for the decoration both of ecclesiastical and secular buildings. Although the artists making use of it have been men of considerable talent, they have not been able to evade the æsthetic objections to the use of colour in sculpture, the intention of which must be to add a further charm to an object which is already complete in itself, and the effect has not been altogether satisfactory. The process here described is not open to the same objections. The relief is only a raised preparation for subsequent painting, not a modelled surface to which colour is afterwards added; and, although the "gesso" is delightfully suggestive before the metal is put on (a suggestiveness which it is impossible to reproduce here, because features and limbs are without modelling and drawing except in silhouette), it is a colour treatment which it suggests to the mind, not completion in relief.

The process is not complete until the colouring is finished, and through all the steps the completed result is kept steadily in view. The appearance of projection produced is astonishing, yet without the vulgarity which one may describe as "leaping out of the frame."

The drawback which most affects the work is that there is no place for repentance. Everything must be foreseen from the beginning and provided for. No "pentimenti," no repaintings, no alterations so dear to the painter of easel pictures, no "putting it in just to see how it looks," and feeling for a something which may turn out finer than what was

FIG. 5.

originally intended. The raising has to be done and finished, then the metalling to be done and finished, before the work in colour begins, and no great alteration is possible. But after all this only shows its near kinship to architecture, a relationship of which "gesso" workers should be proud! Even in the minor arts success is to be attained only by knowing thoroughly what one has to do and doing it; by getting a firm mental grip of all the necessary conditions; in a word—by vision, by seeing the completed work by the power of imagination—absolutely the same power, though differing in degree, as that by which the greatest artists of all time have conceived those works which still move and ever will move the whole world to admiration.

ARCHITECTURAL ASSOCIATION.

THE ANNUAL DINNER.

THE banqueting room at the Criterion Restaurant in Piccadilly looked very festive on Thursday evening last, when the Architectural Association were holding their annual dinner, presided over by Mr. G. H. Fellowes Prynne, who has so ably filled the post of president for the past two years. The gentlemen present included: The Bishop of Rochester, Rev. A. B. Boyd Carpenter, Mr. William

Lewis, Mr. E. Greenop, Mr. E. Howley Sim, V.-P., Mr. H. G. Tayler, Mr. G. Bailey, Mr. A. Wingate, Mr. H. E. Rider, Mr. W. Thornton, Mr. C. Brée, Mr. F. W. Macey, Mr. P. Buckman, Mr. T. C. Yates, Mr. P. L. Forbes, Mr. G. H. Smith, Mr. D. G. Driver, Rev. J. Beeby, Mr. E. Prynne, Mr. E. Symons, Mr. W. A. Forsyth, Mr. W. A. Pite, Mr. A. Bolton, Mr. A. S. Flower, Mr. D. Seth-Smith, Mr. C. Trollope, Mr. H. Prynne, Mr. R. H. Hale, Mr. E. Runtz, Mr. F. R. Farrow, Mr. A. H. Hart, Mr. F. D. Wood, Mr. R. Dircks, Mr. R. G. Booth, Mr. W. Wonnacott, Mr. G. S. Fleetwood, Mr. R. H. M. Bowen, Mr. W. C. Williams, Mr. Buckingham, Mr. C. Reader, Mr. G. Trot-

The next toast, which also fell to the lot of the Chairman, was

The Church and the Legislature.

For this toast, which had not always been on their list, no apology was needed, and he wished to treat it broadly, for as artists they knew no party in politics and no narrow-mindedness in religious thought. Art as art had no distinction whatever, and we admired it wherever we saw it, in the cathedral or elsewhere. And who could gauge the enormous influence which the Church had exercised on architecture? It was impossible to do so. Had not the greatest incentives during the past ages to build the noblest edifices been, from the first, religious incentives, and had not the Church been the great force and lever? Look for one moment at the temples of Egypt, of Persia, India, Greece or Rome, and it would be plainly seen that they all spoke one tale. Or look again at the beautiful and the symbolic that permeated the grand Byzantine and Christian periods; there again was the same story. Man's highest monuments had been those raised to the glory of God, and second only to the instinct of religion had been the national instinct, that desire to pass on from age to age the nation's history. But to-day there was a change. Were we satisfied with the buildings around us, did they tell us the history of our day, and were we satisfied with the mean economy which cut down the expense of our buildings? Surely some man would arise who would think not only of utilitarian but of monumental and national buildings, for he was of those who believed that Church works and national works had a great influence on the minds of men, and they either spoke of the greatness or the littleness, the riches or the poverty, the strength or the weakness of a nation.

The Bishop of Rochester, in responding, said that Church and Architecture owed a great deal to one another. If we asked what were the noblest outward possessions of the Church in our country to-day the answer would be the great cathedrals erected by the men of the Middle Ages, to whom the Church gave their best opportunities. Very often it was the architect and the ecclesiastic combined in those days, as in the case of William of Wykeham. There being this connection, we were conscious of each other's weaknesses and foibles, and had lived together through revivals. We had our great buildings, but he could mention the names of some clergy who were suffering from the architectural experiments of the early part of the nineteenth century; while on the other hand they all knew of architects whose schemes had been cut and altered to meet a strong-minded clergyman's views. But, turning to matters more serious, there was, indeed, a connection between architecture and the highest faiths of man, and he was quite sure that a great uplifting power of humanity in the future would be the relation between its highest spheres of activity and the highest creative forms of its spirit; and similarly between religion and all the forms of art, architecture most decidedly included.

Sir Henry Howorth, who responded for the Legislature, made a speech characteristic of so well-known a member of the House of Commons, and not being in the regulation dress for dinners, he humorously explained that it was not his fault but his misfortune. "I looked around," he said, "and I thought what a handsome lot young architects are, but I am sure, gentlemen, it is due to yourselves and not to your costume." Incidentally he referred to Mr. Gladstone and Mr. John Bright, and to emphasize what a glorious House was that of the Lords he said that the late Duke of Argyll was not only hereditarily a duke, but was descended from a grand list of mythical heroes of the worst kind. Referring to art, he said this was a most difficult question to deal with in the House of Commons, which body included a large number of Philistines, who, however were willing to do the right thing if the doctors would agree. We had what he considered to be the greatest marvel of buildings in the House of Commons, if we remembered when it was built, for the middle portion of the Victorian Era was conspicuously debased

FIG. 6. (See Article on "Gesso," p. 321.)

Emerson, Pres. R.I.B.A., Sir Henry Howorth, Mr. H. L. Florence, Mr. Basil Champneys, Mr. Seth-Smith, President-elect A.A., Mr. E. W. Mountford, Col. Ottley, Mr. W. E. Riley, superintending architect to the London County Council, Mr. Beresford Pite, Mr. L. A. Stokes, Mr. W. J. Locke, Mr. Thomas Blashill, Mr. A. Jacob, Mr. E. T. Hall, Mr. F. Machin, Prof. Hulme, Mr. H. W. Pratt, Mr. F. W. Pomeroy, Prof. R. Elsey Smith, Mr. H. Holloway, Mr. C. Wall, Mr. H. Lovegrove, Mr. G. Tooley, Mr. G. B. Carvill, Rev. W. J. B. Wonnacott, Mr. A. Stalman, Mr. S. Constanduros, Mr. L. Butler, Mr. A. J. Dalton, Mr. E. Carless, Mr. S. C. Arding, Mr. W. E. Davis, Mr. W. G. B.

man, Mr. R. Lovell, Mr. R. H. Weymouth, Mr. R. S. Balfour, Mr. F. R. Taylor, Mr. F. W. Foster, Mr. J. F. Bull, Mr. H. A. Satchell, Mr. H. G. Turner, and Mr. M. Garbutt. "After an excellent repast," to quote a hackneyed reporting phrase, the Chairman gave "The Queen and Royal Family." He referred to the war now being waged, or perhaps better, now practically finished, in South Africa, to the feelings of loyalty which it had evoked in the breasts of our countrymen, and to the influence it had exerted on our Colonial Empire, bringing all parts into one great whole. He gave them "The Queen," and the toast was drunk with enthusiasm and fervour.

in its standards, and it was remarkable that such men as Barry and Pugin should have been given such freedom. But we were thankful for their work. As to glass-painting, what could be worse than that produced thirty years ago? There was also sculpture, in relation to which the House of Commons had been most lucky and most unlucky. We had a lot of statues of kings and queens which were despicable, yet there was recently added that excellent statue of Mr. Gladstone by Mr. Pomeroy, who was with them as a guest that evening. But we were commemorating a number of commonplace persons in the House, and he hoped that their children or grandchildren would take the works away. He urged young men never to sacrifice art for money, and cited the instance of the sculptor at Parma who executed a figure of the Virgin for the Venetian Council. These men wanted so much of this done and that altered that the sculptor smashed the statue, for which he was brought before the dreaded Inquisition and narrowly escaped death.

At this point we had a song, "Listen, my Darling," from Mr. S. Constanduros, who made so successful a hit with the same song at the recent A.A. soirée. The next toast on the list was

The Royal Academy and the R.I.B.A.,

which Mr. Beresford Pite proposed. The link that existed between these two institutions, said Mr. Pike, was a very definite one, both by the examinations held, and by the fact that we could not obtain a complete view of our own art if we became out of sympathy with the sister arts. The highest expression of art was the literary art of poetry, which was, however, rather outside their own, and did not create such mutual sympathy as the more graphic arts. The Royal Academy included sculpture, which was really an architectonic art, and we could not be blind to what had been called the spiritual element of Greek art exemplified in the underlying beauty of the great Greek sculptures. Moreover, the highest expressions of Greek architecture were allied to sculpture, and we had a golden bridge to build between the baser use of life and its noblest plane. Our life's work was to ennoble what we touched, and to beautify the common habitations of our race and cities. The R.I.B.A. was a real help, and facilitated by its forms and agreements many of the problems in practical work which were daily occurring. The president, Mr. Emerson, had handed down the traditions of the Gothic revival from the great office of William Burges, and had fulfilled his task in the most able and admirable manner.

Mr. Emerson, in replying, said he had the deepest sympathy with the work of the Architectural Association, and knew that they were animated with the highest art motives. That examinations did promote education had been strikingly shown by the matriculation examinations at the London University, and, though he did not think they helped to make one an artist, they did give a grounding of knowledge which was so essential, but which formerly was not required of the architectural student. He deprecated the system of entering for competitions on purely personal grounds, especially when there had recently been so many competitions the conditions of which were absolutely unfair. He congratulated Mr. Prynne on the excellent way he had filled the presidential chair, and said he was one of the best and most hard-working presidents the Architectural Association had ever had. He was in accord with former speakers that we should try to show our national history and our religion in the buildings we erected, and he regretted that the erections of the present day could not be said to possess these characteristics.

The next toast was that of "The Army and Navy," which was proposed by Mr. E. T. Hall (who coupled the name of the Reserve Forces with the toast), and responded to by Colonel Otley, who assured the company that if we only had 30,000 British "knights" we could march through Europe.

We had next another recollection of the soirée, by the late Mayor of Montillado (Mr. G. B. Carvill) rendering "Isn't that a funny thing to do," with an additional war verse

including the latest news from the front. The Rev. A. B. Boyd Carpenter then rose to propose the toast of the evening,

The Architectural Association,

and in the course of a very eloquent speech said that the great thing in all art was the motive which animated it, and that it would be admitted architecture held its own in the face of all the other arts. Their Association was a young one, for fifty-three was not a long period; yet they had become a great teaching body, and he hoped the time would come when we should understand the spirit of our age and artists should represent powerfully its latest developments.

The Chairman replied. The position of their Association, he regretted to say, was much misunderstood, both by societies, who should know better, and by the public. They were confounded with the Royal Institute of British Architects, and thought to be a junior branch of that body, and they were confounded with the Society of Architects. They were *not* what they were represented to be, but were an independent association working on their own lines, and from the small body of enthusiastic young architects who had formed the Association they had grown into a membership of 1,318; while their list of past-presidents included men who were now coming into the very front rank of the architectural profession. The primary object of their Association was education, with the simple and earnest motive of helping their great art, in which endeavour the officers and the committee had worked splendidly. He wished there were more students at their annual dinner, for he should like them to join in thoroughly in the social engagements of the Association. As for their new president, Mr. Seth-Smith, he felt that he was just the man for the post.

Mr. E. W. Mountford next proposed "The Lecturers and Instructors." The young men were the architects of the future, and he was glad to know they had such excellent instructors, but he failed to agree with Sir Henry Howorth when he said that the nabobs of their profession built the churches and the town halls; he thought these gentlemen were those who designed the public-houses. Professor Hulme and Professor R. Elsey Smith replied, the latter testifying that the Architectural Association students came for instruction, which could not be said of all students.

Mr. C. W. Trollope next gave a recitation describing in a humorous manner the labyrinths of a certain play, which was based on no known principles of dramatic art.

"The Guests" was then proposed by Mr. L. A. Stokes, being responded to by Mr. Basil Champneys and Mr. W. E. Riley, the latter remarking that the ages of great productions had been those of great national trials, and he hoped the same would result from the present war. The toast of "The Committee and Officers" was given to Mr. Thomas Blashill, Mr. G. B. Carvill replying; and the last toast, "The President-elect," was proposed by Mr. H. L. Florence. Mr. Seth-Smith, in responding, thanked them for what they had said, and assured them that having the real interests of their Association at heart he should do all in his power towards its advancement and the improvement of their profession generally.

A new Public Library at Gloucester was opened last Thursday. It adjoins the Art, Science, and Technical Schools, and has cost about £7,000. Messrs. Walker and Sons, of Gloucester, were the architects.

Excavations at Corinth.—The excavations at Corinth carried on by the American Archaeological Institute continue to yield good results. The workmen recently discovered a fountain mentioned by Pausanias. It was partly built and partly carved out of the rock, and is intact. The waters for the fountain were carried by iron pipes, and issued from the heads of brazen lions. Four large marble statues, representing Asiatics, support a marble roof, round which are bas-reliefs with figures of the sun and moon and two dancing Bacchantes. The head of a colossal statue of Adriane has also been found.

NEWCASTLE CITY LUNATIC ASYLUM.

THE NEW BUILDINGS.

THE extension buildings of the Newcastle City Lunatic Asylum, which were formally opened last week, constitute one of the largest works ever undertaken by the Corporation of Newcastle. The Lunatic Asylum was opened at Coxlodge in 1868, and served its purpose until 1884, when, enlargement being necessary, two wings were added. In 1891 it was found that a further enlargement of the institution was imperative, and the site, which had originally been 52 acres in extent, was increased to 100 acres. The foundations of the new buildings, which were the subject of a separate contract, and which involved a vast amount of labour, were put in by Mr. Ferguson, and in July, 1895, Mr. Walter Scott, who has been the contractor for the erection of the buildings, commenced the operations which have now been completed. Mr. J. W. Dyson had been chosen architect out of a large number of competitors, and it is from his excellent design that the new asylum has been erected. The buildings extend over five acres and are substantial and convenient. The old asylum runs east and west in order to give a southern aspect, and the extension is in the same line. Its length from east to west is 1,700ft., and its depth from north to south 130ft. The building contracts amounted to about £138,000, and furnishing and other items are expected to bring the total cost up to about £200,000. The administrative block faces north, and is built roughly in the form of an irregular triangle, at the base of which there is a covered corridor connecting the building with the patients' blocks, which are placed behind in echelon formation, that is to say, one block is behind the block in front of it and just overlaps it at the end. This gives compactness and leaves plenty of air space around the buildings, the ward blocks being placed behind the administrative block and yet keeping a southern aspect open to all. From the main corridor to each of the four blocks there is a cross corridor, and there is easy access to each. The main corridor runs right away to the old asylum, the total length of the passage being 650ft. The male patients are to inhabit the new buildings, which will accommodate 361 persons, the female patients being retained in the older part, where there is room for 450. Each block has two storeys, and each storey is a ward in itself, so that there are altogether in the new building eight wards, each with its own living and sleeping rooms and its own attendants. From each there are two exits, so that in case of fire or panic the patients could be easily removed. Some idea of the extent of the work may be gathered from the fact that the architect's designs covered an acre of paper, and that 400,000 glazed bricks and 300,000 slates have been used. The building is of stone, and the main front is surmounted by a tower 100ft. high, with a clock. To the left of the entrance hall of the administrative department are rooms for the committee, and on the opposite side are apartments for the officials—the superintendent, assistant medical officer, clerical assistant, storekeeper, and others—the bedrooms of the servants being above. The kitchens are on the ground floor, and so is the dining room, which seats 200 persons. The recreation hall is 93ft. long, 48ft. wide, and 32ft. high, having at one end a stage 21ft. wide and 22ft. deep.

A Bandstand in the Victoria Gardens, Bridlington, is to be erected at a cost of £200. The borough surveyor has prepared the design.

The Late Mr. Westerberg.—The death is announced at Gothenburg, Sweden, of Mr. Johan August Westerberg, architect. After leaving Aberdeen, he proceeded to London, and continued his studies there. He afterwards settled in Gothenburg as an architect, and was largely engaged in the extension and rebuilding of the city.

THE PRACTICE OF LETTERING.*

BY EDWARD F. STRANGE.

IN this paper I have no new discovery to bring before your notice, and no new process of study to advise. My subject is the one most intimately bound up with the life of every person of elementary education next to the faculty of intelligible speech; and my object in bringing it before this Society is to endeavour to gain some supporters for a movement against certain tendencies of the day, which appear to many of us to be ugly, unnecessary—the terms are almost synonymous—and fraught with great danger to the younger generation of artists and craftsmen.

I need not take up your time with a catalogue of the various faults of most modern lettering. There is hardly a street in which you may not see bad letters displayed with all the frankness in the world; there is hardly a publication in which you will not find type or drawn letters calmly devoid of any pretensions to beauty; there is hardly a public building which does not possess some weakly pretentious inscription in which the carelessness or variety of the writer is set forth in a way he hardly intended. And my whole object on the present occasion is to try and point out how easily these things might have been better done, and how greatly a little thought, a little modesty, a little good taste would have assisted the makers of these bad letters in the objects they had in view when they produced them.

The Cause of Bad Lettering.

Now the first element of a cure is to ascertain the origin of the disease. In this case I am convinced that much of the trouble arises from an idea that students and craftsmen seem to be continually getting into their heads that they have to design the letters of the inscriptions on their works. Now that is precisely what they must be warned against. You cannot design a letter. You may burlesque it. You may mutilate it by breaking its back in unexpected places. You may complicate it with weird growths of a more or less fungoid nature. But you cannot design it, for design implies invention, and no one can be said to invent what already exists; while any attempt to give new forms to the letters in current use can only be compared for audacity with deliberate experiments in the making of new words—I would even go so far as to say new languages.

Now, if a craftsman lays himself out to give a letter a new shape he is paying himself the compliment of asking several hundred millions of persons to accept his image and superscription, instead of that which many generations of themselves have already agreed upon. It would be sublime if it succeeded. But in practice it is simply ridiculous.

I must guard against being misunderstood on this subject. I have said that

you cannot design a letter

—the form stands. But it must be made absolutely clear that this statement applies only to essential structure. It is impossible for anyone who possesses any individuality whatever to express himself in any medium without endowing it with character. That may be seen in handwriting, slipshod and utterly bad as most of our scrawls are. If we want to be understood there is always a point beyond which we may not go. However our training, our carelessness, our physical peculiarities may warp them, we must always keep recognisably close to the accepted forms of the written letter, or our purpose in writing fails, we do not convey our thought to the intended recipient of it, we have simply spoiled paper with futile and illegible marks.

But as to character. This means, for us, a certain personal singularity in the making of letters which gives distinction—individuality anyway—to the accepted and still easily understood letter. I would instance to you the types made by William Morris, and especially the Roman type on the basis of that of Jensen.

There is nothing to prevent a craftsman from getting his character into his lettering—if he has any, and takes pains enough to develop it. But it will not be done by setting to work as I see so many do, who simply sit down at the last minute to hunt up a convenient model for the hated but necessary lettering, copy it more or less perfunctorily, put in a few eccentricities or excrescences on the spur of the moment, and then wonder why the result does not look well.

So far I have dealt with the abstract drawing of the letter, but there are other considerations of high importance. But before passing on to them, I wish to draw your attention to an example of definite form, which is not only historically interesting, but of the greatest practical value. This is the alphabet of square capitals from

The "Geometria" of Albert Durer,
